It is a serious question of the first magnitude as affecting the entire future relations between great nations as to how far one nation is to so develop its industrial resources as to make them a constant war menace for the rest of the world. The matter is of the utmost importance now that experience has shown us all that war in the twentieth century is so largely a series of engineering operations. The nation with the most extensive engineering works, and with the largest number of trained people earning their livelihood therein, given the facility for securing ample supplies of necessary raw material, may be so prepared for war emergencies as to be able to dictate the policy of other nations. Germany's works of this character are at present practically intact; whether or not they will remain so at the end of the war is quite another question. But whatever happens in that connection the lesson has been learned, and as one consequence we may reasonably suppose that after the war international trade between Germany and Russia will not be resumed on the old basis. Russia, in order to be independent of German electrical manufacturing in the future, must either increase her own productive capacity or she must import increasingly from Great Britain, America, Japan, Sweden, etc. The former of these alternatives has exercised the minds of Russian electrical and other industrial authorities a good deal, and we may expect to see increased manufacturing capacity on Russian soil as time goes on; but as things stand, and until a new and industrial Russia emerges, importation must be relied upon. Leaving our Allies and neutral manufacturing countries out of consideration at present, let us ask what will be the position of British electrical manufacturers in relation to the coming Russian

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE—4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AGEEKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 6d.; Canada, £1 3s. 10d. (\$5.80).

FOREIGN AGENTS:

NOTICE.

IN view of the recent Increase in the Postal Charges, our Subscription Rates for Great Britain and Canada will until further notice be increased to £1 1s. 6d. and £1 3s. 10d. respectively.

demand. Some of her writers are blaming us for our past indifference to the market, and are seeking the reasons therefor and drawing their own conclusions as to what may be expected in the future. Granted that a good deal must depend upon Russian national policy in regard to import trade, and the possibility of that policy favouring British traders, we have to remember that British electrical manufacturers are faced with many other problems in regard to the future which are somewhat closely related to the question of their activity in Russia. They are eager to secure the Home market to themselves, also to meet the needs of the Colonies and dependencies, while France and Belgium and Italy desire their assistance, or will do for a time, and there will further be no disposition to reduce their hold on foreign markets in which they already have desirable connections. They may distribute their attentions over all these markets, Russia included, without meeting any of them to the full, but the question that is naturally being asked in some of these other countries is, how far it will be possible for them to depend upon British industry if they make plans for trying to prevent enemy trading within their borders. Will the character of British products be adjusted to meet their requirements? Will British manufacturing or productive capacity be increased to any large extent? We believe that to both of these questions the answer is emphatically in the affirmative, but will the capacity be sufficient to justify other nations in basing international trading policy upon possibilities in this direction? As our deliberations on after-the-war trade policy proceed we may expect such questions to be more and more searchingly asked and discussed by our Allies, and it is as well that we should consider the matter as calmly and carefully as we can in readiness. We may be as anti-German in sentiment as the horrors of this war compel us to be, but the fact will remain that, if in any country whatsoever other nations cannot suitably meet the requirements of purchasers, the trade will go to those who are in a position to do it, and who are not merely in that position from a manufacturing capacity point of view, but are eager to employ every possible means of adaptation and enterprise within their power to attain that end.

We have been led to make these remarks more particularly by an article which has appeared in *Elektrichestvo*, of Petrograd, on the prospects of future electrical business between Russia and England. There is so much of interest in this article that we quote from it fairly fully elsewhere in this issue. The author is Engineer P. Gurevitch. We suggest that his contribution might well be made the basis of a very serviceable discussion. It is well that we should see ourselves as we appear in the eyes of a friend, but he offers certain criticisms to which we are sure our manufacturers could effectively reply. He suggests that British electrical manufacturers will lose certain markets because Germany, being out of favour elsewhere, will concentrate her energies remorselessly upon those markets, fighting us with the old weapons of low prices and long credit until she succeeds. Taking this, we think too readily, as accomplished, M. Gurevitch uses it as an argument why we should display our utmost enterprise in seeking new markets—especially in Russia. We do not believe that British electrical and engineering firms need much more urging at this particular moment to display enterprise in Russia. The war has roused many of our trading interests from their former lethargy, and the future will be different from the past in that respect or we are greatly mistaken. It will be different for our enemies also. The condition of affairs in Germany at this moment, and the more serious position that is inevitable, do not, in our opinion, suggest that we shall be defeated in the future by the long credit given by Teutonic firms. Further, if we are to meet the demand we must be to some extent assured concerning the inducements.

Our electrical confrères in Russia should see to it that their arms are not so wide open to German electrical firms in the future, and that German financiers and electrical organisations are not so privileged in the facilities granted to them. They should also bear in mind that there are other difficulties beside that of the language and demands for long credit that have led some British traders to be disinclined to operate in Russia. M. Gurevitch has something to say regarding the bad reputation of some Russian business people. Much is to be gained by the promotion of a spirit of confidence and trust between the trading communities of our two great nations. The war has brought about a better understanding between us, and the mutual sacrifice that we are making in the cause of world civilisation will, we trust, be followed by mutually satisfactory fair and square commercial dealings which shall be uninterrupted for a generation. Electrically we shall play our part up to the limit of our enlarged capacity. Labour problems, especially the prospects of "dilution" being continued after the war, the employment of women, and the abandonment for ever of limitation of output, have much to do with this question of future capacity. Assuredly the worker requires educating as to the importance of the effect of these matters upon the future trade of the Empire, and of the promotion of desirable commercial relations with our Allies. Of course, our manufacturers will weigh up in good time the question of that capacity, and we hope that they will accommodate themselves to all the coming markets of the world according to the developments in the situation. But we hardly think that they will be inclined to relax their hold upon a market where they can do good business, and where the possibilities are immense, until they are assured of success in another that is offered to them. However much they may welcome good desires and believe in anti-German sentiments, they will require to know more about the Russian Government's policy for excluding German electrical manufactures. On the other hand, the Russian Government is not likely to deprive German traders of facilities if by so doing it is going to affect adversely Russian developments; therefore, it is not unlikely that it will want to know something about British, Allied, and neutral manufacturing capacity. The situation is not an easy one to deal with, but the details will inevitably hang very largely upon the broad principles which are adopted by the Trade Conference of the Allies—if the war position is such as to enable any definite conclusions to be reached when that conference takes place.

Lead.

The lead market has preserved a wonderfully steady tone, and there was hardly any change in values even when it became necessary to sell some fair quantities of lead which had been loaded for Russia some weeks ago, the vessels containing which had not left British ports. The demand continues distinctly active on account of the home trade, but there has not been much doing generally in connection with the export markets, although within the last few days a few inquiries have been met with from Russia for April-May shipment. At the present time the White Sea is frozen up, and no more shipments are likely to be made to Archangel until the route is pretty free from ice. A good deal of lead has been imported lately, and thanks to this there is a plentiful supply of metal for early delivery, but demands have been good enough all along to absorb everything reaching here.

The position depends very largely, no doubt, upon shipping conditions which have become abominably muddled. The monstrous charges and hopeless muddle at ports, combine to put out of effective operation all economic factors tending to relieve the position, and it seems to be

nobody's business to direct matters with the smallest degree of commercial intelligence. Probably things have about reached their limit now, and there seems to be a faint hope entertained in some quarters that "something will be done." It is absurd to look for any change for the better until a little common sense is brought into play, until the vessels lying rotting on account of ineptitude are made use of, until steps are taken to control the extravagance and waste in connection with official chartering, and until arrangements are made for discharging vessels when they do arrive. So far the promises of improvement which have been made have been entirely illusory, but if conditions were changed in this respect there would soon be an end of the extravagant prices everywhere demanded for commodities, and the sooner the situation is handled with a few grains of common sense the better for the nation at large.

The advice coming to hand from Mexico suggest a distinct improvement in the mining position there, and this is all to the good, for, as Messrs. James Forster & Co. point out, Mexico produces in normal times 120,000 tons a year, or about 10 per cent. of the world's lead production.

Fatality in the Bath.

THE fatal accident recorded in our last issue affords a grave warning of the danger of a little knowledge in connection with electrical affairs. It is very well for the young tyro to experiment with electric bells and pocket lamps, or anything else that can be fed from primary cells, but when he tampers with conductors connected with the public mains he is embarking upon an enterprise which may have disastrous results. This is well understood in the case of gas and water supplies, which have been with us so many years that the public thoroughly understands its position with regard to them and the dangers which follow ignorant and unskilful tampering with the pipes and fittings; electricity, however, is comparatively a newcomer, and has not yet acquired the respect of the ambitious schoolboy anxious to demonstrate his cleverness.

It is true that in the case in question the combination of circumstances happened to be exceptionally favourable to the prospects of disaster, and was probably unique—may it remain so. In ordinary circumstances the lamp might have remained in use for years without mishap. But the flexible cord was held in place only by tacks, and when the boy, in haste to extinguish the light, seized the hot bulb instead of the switch, apparently in dropping the lamp he jerked the flexible off its frail supports.

The moral to be drawn is that on no account should any unqualified person be permitted to meddle with the wiring of electric lighting installations. The bathroom especially is the very last place in which foolhardy experiments should be allowed.

Tapping Blast Furnaces.—At the Edgar Thompson works of the United States Steel Corporation, blast furnaces are tapped by a method devised by the engineering department of the Westinghouse Electric and Manufacturing Co.

An electric arc is drawn between an electrode and the chilled metal in the tap hole; the heat of the arc burns through the chilled metal, until the fluid contents of the furnace are reached. If during the opening operation non-conducting material is encountered, it is necessary to stop the arc and drive a steel bar through this mass. The process of melting is then continued, the arc following this bar of metal.

A 250 volt circuit is used, the pressure being reduced by means of a water rheostat. A current of from 800 amp. to 1,000 amp. is ample for the operation. The apparatus required consists of a special electrode holder, electrodes, cable, a resistance, and a head shield or prot. cbr for the operator. The electrode holder consists of an iron pipe 4 ft. or 5 ft. long, in one end of which the electrode material is placed and clamped by means of a ring; the end of the pipe is split in order to give a clamping effect when the ring is forced down towards the end of the pipe. In the other end of the pipe a wooden pole is placed, the cable connection being made to the iron pipe. The entire length of the electrode and its holder is about 12 ft.

INCREASING THE TRAFFIC CAPACITY OF TELEGRAPH LINES BY ACOUSTIC TUNING.

THE usual connections for D.C. telegraphy with Morse sounders are subject to the disadvantage that with closed-circuit or with open-circuit working, so long as communication is in progress between two stations, all intermediate stations must remain idle. On a line with many intermediate stations, this naturally involves great delay, particularly during busy hours, and a line which is ample for the average daily traffic may be hopelessly inadequate during the rush hours. The two main methods by which the traffic capacity of a telegraph network may be increased are (1) by increasing the average capacity of the transmitting and receiving instruments; (2) by increasing the message capacity of the line—i.e., by using high-speed instruments and multiplex working respectively. High-speed instruments are generally fairly complex, and must be served by a crew of skilled operators, so that they are chiefly limited to long-distance main lines, with high traffic density during a large fraction of each day. Multiplex working also shows to best advantage only when traffic is dense, but the apparatus used is little more complex than for ordinary one-direction working, and no special preparation of messages is required. Combined high-speed and multiplex working is particularly adapted to the interchange of messages between two large towns, and offers nothing to the solution of the problem of maintaining free intercommunication between all possible pairs of stations on a line dealing principally with local traffic of this nature.

A system facilitating such intercommunication must be

FIG. 1.

FIG. 2.

infinitely flexible, i.e., permit simultaneous communication between any pair of the series of stations served, and it must involve only apparatus which is reasonably cheap to install and quite simple to operate. Recent advances in the use of alternating currents for signalling purposes suggest that the principle of variable-frequency tuning might be used to advantage in developing simultaneous signalling without interference over a single line. Dr. Oscar Srnka, of Brunn, has recently devised a multiplex system on this principle, using alternating currents of different frequencies on the same line and passing through all stations on the latter, but each frequency affecting only that receiver tuned for its reception. The sender, receiver and auxiliary apparatus at each station are connected in series with each other and with the line, and each station is allotted, for reception purposes, a definite A.C. frequency. Giving suitable arrangements for sending signalling current of appropriate frequency into the line, this system eliminates waiting (except where a station is already engaged), and gives each station access to all the others at all times by a single line.

For reasons given later, it is convenient to keep the frequencies used between, say, 600 and 1,100 cycles per second. With a difference of 50 cycles (i.e., 600, 650, &c.) 11 stations per line are possible between these limits, and if this be not sufficient, 14 stations can be operated by reducing the difference in frequencies to 40 cycles. A smaller difference is not desirable, since 40 cycles at 1,120 cycles represents only 4 per cent. difference, and this is as low as it is safe to go without endangering accuracy in selective working. If more than 14 stations should be desired on

one line, the best solution is to extend the frequency range above 1,000, or below 600 cycles. To prevent confusion by harmonics, the even progression of frequencies should be broken, say, by the use of 1,250 instead of 1,200 cycles (which would probably confuse with the 600-cycle messages); 1,350 instead of 1,300 cycles (which = 2×650 cycles), and so on. This also provides a greater percentage difference between the several frequencies, and makes working safer in consequence.

The apparatus employed consists of a "mono-telephone," or tuned A.C. telephone (fig. 1) for reception, and an adjustable, variable-frequency "singing telephone" for transmission purposes. The mono-telephone responds vigorously to alternating current of the frequency for which it is tuned, but is practically unaffected by alternating currents of other frequencies. In the sketch, which is based on a drawing in *Elektrotechnik*, a steel membrane m (1 or 2 mm. in thickness) rests on three fine points set 120° apart round the nodal line of the fundamental wave—i.e., on a circle of diameter = $0.68 \times$ the diameter of the membrane. A powerful magnet M has an iron core K carrying a fine wire winding s of 200 to 400 ohms resistance. The core K is hollow, and to it is connected a forked tube r leading to the telegraphist's head-piece receivers. Both the operator's hands are left free: the monophone is protected by a glass bell jar.

An ordinary telephone receiver with rim-fixed membrane responds to all frequencies, but a membrane supported as in fig. 1 responds freely only to a frequency identical with its own natural frequency. The latter depends on the

or less skilled manipulation. Once built, the monophone should need no further adjustment.

To eliminate the necessity for a head-piece receiver, a loud-speaking monophone may be built on the principle illustrated in fig. 2, using two membranes actuated by two magnets and supported respectively on cork and on steel points, the lower membrane being drilled to admit the pins carrying the upper membrane. A horn with telescope tube for acoustic tuning, and a thin elastic diaphragm for dust-exclusion, complete the apparatus. Where a permanent record of messages is required, a mono-frequency relay, in combination with a differential relay, operates a printer, the arrangement being as shown inside rectangle (1), fig. 3. In this diagram, m represents a monophone membrane (as in fig. 1), actuated by the relay coil s . A nickel-silver contact-plate at the centre of m makes contact with a rounded contact piece on a light and delicately pivoted lever h . The latter is counterweighted, so that it has a frequency of swing slightly lower than that of m , but does not affect the natural frequency of the latter. During idle periods the adjustable spring f (fitted with a felt pad) holds the lever h lightly on to m , so that a closed circuit is maintained between the points a b , and the differential relay R keeps the position shown. When, however, a signal sets m swinging, the lever h is not able to keep exactly in step, its contact with m becomes imperfect, and the relay R , therefore, closes contact 2, and so completes the local printer circuit B_2 w_2 , and the signal is printed on P . Adjustment is effected by a screw setting the position of s , or by shunting the coils of the latter; the relays are placed under a dust-tight cover, and mounted on a rubber block to absorb external vibrations. By adding a resonance tube the monophone relay can be adapted for audible reception as well as, or instead of, giving a printed record; when receiving by sound the printer is stopped, and the switch s_1 opened.

So far only incidental mention has been made of the apparatus used to produce the frequency required for signalling to a selected station. Each station must be able to produce with ease and certainty A.C., at all the frequencies required by the $(n - 1)$ other stations on the line. The apparatus used for this purpose must be reasonably cheap and compact, and it must be reliable and simple to manipulate. Tuned buzzers might be used, but a battery of them to supply ten or a dozen definite frequencies would be costly, take up a good deal of room, and need more skilled attention than can be counted on in a country telegraph office. Toothed-wheel high-frequency alternators run at variable speed offer another solution, but the difficulty is to provide means for maintaining speed constant at the desired value, particularly where there is no ordinary electricity supply available to serve a driving motor. The Larsen acoustic, variable-frequency A.C. generator offers a simple, inexpensive and technically satisfactory way out of the difficulty. The generator yields a nearly sinusoidal current, and therefore sets up clear musical tones in air. In the rectangle (2), fig. 3, a singing telephone T is provided back and front with tubes r^1 , over which slide tuning tubes r ; the telephone is coupled electromagnetically to a microphone M by the induction coil J . By varying the setting of the tubes, the frequency of the A.C. is controlled; for any particular setting, the frequency of the current delivered by the secondary of the induction coil is constant within a fraction of 1 per cent., and falls normally between the limits 600 and 1,100 cycles per second, but can be made higher if there is a specially large number of stations on the line. The positions of the tubes r corresponding to predetermined frequencies are naturally determined once for all, and marked on the tubes themselves.

Fig. 3, as a whole, shows the complete lay-out for an intermediate station. The through-line L is connected, *via* the lightning protector S , to the change-switch w and the station apparatus. The receiver gear (in rectangle (1)), is adapted to audible or printing reception, and by connecting a second monofrequency relay to the terminals a b (or possibly just by using a second membrane beneath s), the second relay or membrane being tuned to the same (special) frequency in each station, provision may be made for simultaneous reception throughout the system of time signals, weather reports and other official intelligence. The transmitter, in rectangle (2), is connected to the line through a transformer T , and

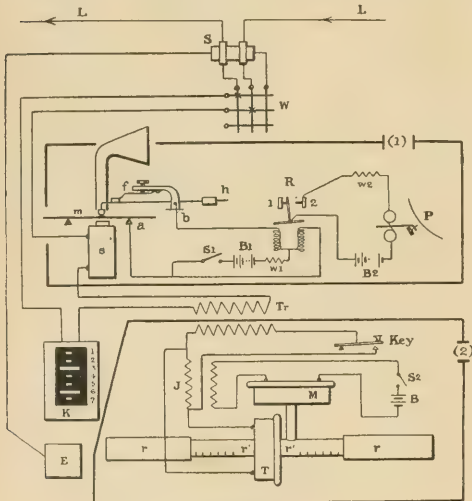

FIG. 3.

diameter of the membrane, and it is thus possible to make monophones to respond to any desired frequency, this frequency being constant throughout the life of the instrument, i.e., no frequency adjustment being required in ordinary working. Though, in practice, the monophone membrane will respond to others than its exact natural frequency, it does so very weakly, and the difficulty is not to pick out the loud signals intended for the station concerned, but to read the faintly-reproduced signals belonging to other stations, even supposing one wished to do so. By placing a closed resonance tube T over the centre of the membrane, the fundamental note is rendered yet more pronounced, and there is no possibility of mistaking it. For frequencies of 1,100 and 600 cycles per second the wavelength of sound = velocity/frequency = $33,300/1,100$ or $600 = 30.3$ or 55.5 cm.; and the length of the tube T (closed at upper end) = wave length/4 = 7.6 to 13.9 cm., which is quite a convenient range of dimensions.

It should be noted that the tuning of the receiver is entirely mechanical and acoustical—there are no tuned circuits, involving complex construction and needing more

frequency meter K of the vibrating reed type. This meter indicates whether a station with which it is proposed to communicate is already engaged; in the case depicted, the meter shows stations 3 and 6 already engaged. The whole equipment is compact, simple to operate, and not unduly expensive. For use under average conditions on lines with 10 to 15 intermediate stations, it seems to be of distinct interest.

MODERN PRINTING TELEGRAPHY.

DISCUSSION AT EDINBURGH.

THE paper on "Modern Printing Telegraphy," by MR. H. H. HARRISON, was read before a meeting of the SCOTCH LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS at Edinburgh, on Tuesday last week. The meeting was largely attended by members of the telegraph staff of the General Post Office in Edinburgh.

Replying to MR. TURNBULL (Edinburgh), who asked if anything had been done to connect electrically two typewriters, so that the operator at one end could work with his vis-à-vis at the other, MR. HARRISON explained that the London and Manchester circuit had not less than hundreds which were controlled when transmitting with one operating line wire. MR. MCGREGOR (Edinburgh) cited a case where a civilian telegraphic staff had been very considerably reduced—i.e., in the *Scotsman* office in Edinburgh. He explained that there they had had three wires, but that now they worked with the Creed system upon one line. The saving in cost of maintenance, &c., would be great. There were now two or three operators against five or six. The apparatus was bought outright at a cost which would in three or four years be covered by the amount saved in the wages of the operators who had been dispensed with. MR. DANKES (Edinburgh) agreed entirely with the author that Morse signalling could not go out of use, as the present war had shown that there was no system to approach the Morse. In the commercial world, however, the Murray-Baudot had points to commend it.

In the course of his reply, MR. HARRISON, in answer to MR. MCGREGOR, said he took it that in the case he had cited the Creed wire was not always running, and that occasionally there were corrections and service instructions to be sent. While it was possible to work with Creed on the staff as MR. MCGREGOR had suggested, and with no knowledge of Morse, it would be awkward if any mishap occurred. He imagined, therefore, that a Morse operator would still be needed in an establishment with a Creed installation only. As to driving, his opinion was that the weight-driven transmitter was a very good form if they made the motor large enough; he imagined that many, including those in post offices, were on the small side. He was inclined to think that transmitters and reducers on the Creed system should be driven by the phonic wheel.

DISCUSSION AT MANCHESTER.

MR. HARRISON'S paper was also read and discussed by the MANCHESTER LOCAL SECTION on January 25th.

MR. W. J. MEDLYN said that in Manchester the Murray and Western Electric Co.'s printing systems were used, whilst Liverpool used the Siemens and the Baudot systems. The Wheatstone automatic and the Creed reperfector and printer were also used at both the above centres. On the Murray and Western Electric apparatus in Manchester, operators had no difficulty in typing at the rate of about 50 words per minute, and thus keeping well ahead of the automatic transmitter running at 40 words per minute. In Manchester, specially prepared ink rollers were used, and the printed tape or page print was afterwards run through a copying machine in order to produce a duplicate for departmental purposes. The printing of a duplicate by the telegraph apparatus itself would, if possible, effect a considerable saving. The high-speed one-channel automatic printer appeared to have a disadvantage in the delay experienced in obtaining repetitions or correcting errors of transmission. Questions had first to be perforated on one of the sets and then wait their turn for passing through the common transmitter. The required reply suffered delay at the distant end through the same reasons.

MR. A. BROOKER said the printing telegraph practice of the future was apparently to be based chiefly upon the work of Hughes and Baudot. The valuable work of the Post Office engineers had to be recognised, particularly in duplexing printing telegraphs. It was not fully appreciated even now that a differentially wound instrument, although balanced to a steady current, was not necessarily so to transient currents; in fact, an instrument could hardly be made truly differential to transient currents of different duration and voltage. The author had issued a warning to inventors who tried to produce signals by varying current strength; if he held the opinion that even with perfectly insulated lines variable-current methods were not going to succeed, it would be well if the warning was more definite and reasons given.

MR. T. E. HERBERT said, regarding the author's statement that the typewriter class of printer would survive, that Murray constructed a special typewriter with a very short type-bar and ball bearings, with a view to increasing the rapidity of the machine. The final result was a speed of about 200 words per minute. The recent telegraph of Siemens claimed a rather higher speed with the aid of the type-wheel. He was not convinced that the type-bar would eventually survive the type-wheel. In designing his own

machine the author had adopted a type-wheel. There was a simple form of type-printing telegraph (constructed by Siemens) in extensive use in Germany, and it would be remembered that in this country the Steljes admittedly failed, because it was badly constructed; had the construction been better, it would have been in extensive use to-day, and, as things stood, there was nothing to replace it for short-distance work.

MR. T. PLUMMER said that in Birmingham the duplicating of messages had been abandoned. Only one copy was prepared, which was passed on to the public, but certain particulars embodying number of words, address, times, &c., were recorded on a portion of the message form, which could be detached and retained. The old method of taking carbon copies had apparently been abandoned, in which case one of the great difficulties of inventors of printing telegraphs had been removed. Birmingham had two sextuple duplex Baudot sets working to London in place of four quadruple and four duplex sounder circuits. The Birmingham-London cable was underground, paper-insulated, and the four quadruple sets were worked on loops, i.e., without any earth connection, and on the top of the loops the four earthed duplex circuits were superimposed. The old arrangement gave 12 channels working in either direction between the two cities, and these 12 channels, which formerly took up eight wires, were now being provided by the two Baudot sextuple duplex sets, taking up only four wires. The new arrangement released lines for extension to other towns. A trial was made recently to find what the Baudot sets could do, and the record, Birmingham to London, was 849 messages finished and disposed of in an hour. Since this traffic did not keep the instrument fully employed, the figure could not be taken as the maximum possible.

MR. G. C. MORRIS said that when contrasting the single-channel high-speed with the multiplex low-speed instrument, a point to be borne in mind was the speed at which the printed tape could be gummed on message forms and checked. Gummers and checkers all worked in one group with the high-speed instrument, and there was only one tape to be gummed; the work could, therefore, be easily distributed amongst the group, and the size of the group varied according to the speed. With a multiplex, however, one gummer was required for each channel. The transmitter also had to be considered, and the speed of the channel had to be adjusted to give both ends suitable loads. An electrical combiner consisting only of relays coupled with a rotating type-wheel offered the best solution of many mechanical difficulties. Regarding the use of perforated tape as a reservoir of signals, although this had been employed for many years it was far from satisfactory. The difficulty in making punches to work rapidly and accurately was surprising, and worn punches and dies were often a source of stoppage. Paper of variable thickness also contributed to the faults. With Col. Squier's sine-wave method of telegraphy, all fine printing signals might be sent simultaneously on one segment, and suitably sorted out at the receiving end, using tuned circuits. If so, the speed of circuits would be enormously increased.

MR. F. D. LATIMER drew attention to the invaluable pioneer work of the late Mr. Fred. Higgins, of the Exchange Telegraph Co., and said that the relays of the Exchange Telegraph Co. were not situated at the receiving end, nor were they polarised; they were sufficiently sensitive, however, to respond to the current impulses at the rate of about 2,000 per minute. In practice it had been found that in a transmitter running at 100 revs. a minute, the electromagnets had an "apparent" ohmic resistance of approximately nine times the actual ohmic resistance, consequently the operating current was only one-ninth of that under steady current conditions. Some years ago the Exchange Telegraph Co. maintained about 700 financial recording instruments scattered throughout London, and all controlled by one operator stationed at the central offices in Cornhill.

THE AUTHOR, in reply, said that the type-bar translator was the only satisfactory translator which would make duplicates, but the one difficulty in making duplicates with the printing telegraph was that of feeding in blanks. The only practical way seemed to be to take press copies. The automatic suffered in the matter of delay in dealing with corrections. Hughes showed excellence in the workmanship of his printer, whilst Baudot put forward the correct alphabet, namely, the equal-letter alphabet. It was fair to state that Baudot founded the system of modern printing telegraphs. An objection to varying the current strength for signalling purposes, quite apart from its use on overhead lines, lay in the fact that, in order to produce a suitable alphabet, it required to be an unequal letter alphabet which could not be multiplexed. Generally speaking, it was better to keep away from a system depending on variable-current strength. In the author's opinion, a type-bar translator would give excellent results when worked at 45 or 50 words per minute, or even higher. Regarding type-wheels, he did not think a shaft material could be produced which would stand a speed of 45 or 50 words per minute for any reasonable length of time without shearing. In America, artillery fire control was actually carried out by means of a rather primitive and simple form of printing telegraph using only 16 letters.

National Business Organisation.—THE INSTITUTE OF INDUSTRY (OF GREAT BRITAIN AND IRELAND), LTD., has appointed a Special Committee of its court of directors to meet representatives of important trade interests, with a view to considering suggestions having for their purpose the strengthening of the court of directors, and the co-operation or amalgamation of other similar movements.

JOHANNESBURG ELECTRICITY SUPPLY.

At the meeting of the SOUTH AFRICAN INSTITUTE OF ELECTRICAL ENGINEERS on November 18th, 1915, Prof. J. H. DONSON, M.I.E.E., read a paper on the distribution plant of the Johannesburg Municipal electric supply system, of which he is the engineer and manager. The following is an abstract of the paper.

The municipal area of Johannesburg is over 80 square miles in extent, and is one of the largest of its kind in the world. Electricity is supplied for domestic, industrial, and tramway purposes, there being nearly 20,000 meters on the system, and the annual output being over 25 million units. In 1886, when gold was discovered on the Witwatersrand, the township had a population of 50, which grew to about 3,000 in 1887, and in 1914 had reached 253,274. After the Anglo-Boer war in 1902, Messrs. Mordey and Dawbarn were appointed consulting engineers to the Council, relinquishing their connection with the Council in 1908.

The consulting engineers adopted three-wire d.c. supply at 280-230 volts for the inner area, 3-wire single-phase a.c. at 200-200 volts for the outer area (feeders at 3,300 volts, single-phase, one pole earthed), and 575 volts d.c. for traction. The two voltages for lighting supply cause some annoyance to consumers who move from one area to the other, and the generators being two-phase, some difficulties are experienced in balancing the phases.

The author joined the municipal service in 1909; at that time there were ten feeding points, to which two have since been added. The feeders were single-core cables of 1 sq. in. section (neutrals 0.5 sq. in.), insulated by prepared paper, vulcanised bitumen, and impregnated tape, with two layers of steel armouring, jute served and compounded. The distributors were triple-concentric cables paper-insulated, lead-covered, jute served, and double steel armoured, jute served and compounded. At each main feeding point was a feeder box in the pavement, containing three-wire bus-bars on porcelain insulators, the box being filled with diatrine. Similar boxes were used at the junctions of distributor and sub-distributor cables. Each feeding area was fed by one feeder and was entirely independent of the others; the cables were coupled with studs and links, so that on the occurrence of a fault the whole feeding area was cut off, and the fault had to be localised by disconnecting and reconnecting the distributor cables in the feeder box, causing loss of time.

The system had to be entirely reorganised, owing mainly to frequent interruptions caused by faults on the d.c. feeders. Owing to the vulcanised bitumen becoming soft and plastic, the whole of them decentralised at loads of less than 600 or 800 amperes per square inch—in some cases less than 400 amperes. The insulation resistance of the cables dwindled away, and short-circuiting between the copper and steel armouring was a regular occurrence. "Such a state of feeder cables, attached to a system as has been described and coincident with the failure of the gas engine scheme, made conditions absolutely appalling."

Financial considerations required that the best arrangements had to be made of the existing cables, and the reorganisation of the system occupied several years. The feeder cables were picked up, stripped of all the armouring, and relied on the solid system in glazed earthenware troughs with proper bridge pieces, the troughs being filled with bitumen and covered with bricks. First an additional feeder was run to the centre of the town, so that the feeders could be relieved one by one; the additional feeder was eventually absorbed by the growth of the load. Nearly all the pavement boxes were discarded; underground chambers were built at the feeding points, and feeder pillars at the sub-feeding points. Two or more cables pass each feeding point, with three exceptions, and provide a duplicate or triplicate supply. Isolating switches enable the distributors to be quickly disconnected from the bus-bars when necessary. Direct telephone communication with the power station is provided.

At the chief sub-feeding points, feeder pillars have been substituted for the surface boxes, with isolating switches. Wherever it is possible, duplicate supplies have been provided.

The alteration in the "inner area" took three years to carry out, and little or no trouble has been experienced since the changes were made. The insulation resistance of the feeder cables, however, is relatively low. Joints in the distributor cables were originally made in cast-iron boxes; faults frequently occurred in these, and in such cases the joints have been remade without boxes. Service joint boxes are eliminated as far as possible by running back important services to chambers each dealing with four blocks of buildings.

The "outer area" is supplied with single-phase current at 3,300 volts, transformed down to 200-200 volts three-wire, distributed by underground and overhead networks; an exception is a new industrial area, which is given a three-phase four-wire supply. The high-pressure cables are two-wire concentric paper-insulated and lead-covered, the inner core being insulated for 3,300 volts and the outer, which was earthed, for 500 volts. They were laid on the solid system, and terminated in kiosks containing transformers and switchgear. The high-pressure cables were looped into the kiosks and bolted to the terminals without disconnecting links; in some cases six or seven kiosks were all connected to the same cable without means of disconnecting whilst the cable was alive.

The type of cable and method of laying were quite good, but unfortunately two high-pressure cables often were laid in the same trough, and experience proved that a fault on one cable often affected the other, thus doubling the extent of the damage and the magnitude of the interruption of supply. Locating a fault, with the high-pressure cable bolted hard on to each transformer, was a very lengthy process, especially as there were no easy means of splitting up the high-pressure cable into sections. There were certain disconnecting boxes where high-pressure cables branched, but excavation to the boxes and melting out the insulating compound took hours of labour. Generally, to restore supply took a day or more. Replacing the high-pressure fuses in the transformer kiosks when the high-pressure bus-bars were alive was very dangerous, and the only alternative was to put all the districts served by the cable in darkness until the fuses had been re-inserted. The fuses were of faulty construction, and there were no interconnections on the low-pressure network. From the operative point of view, the transformer kiosks were "veritable death-traps."

The system was reorganised by the installation of link chambers and pillar boxes for high-pressure cables, the linking-up of high-pressure mains to form ring mains, the grouping of transformers, the replacement of certain of the iron kiosks with brick transformer houses, and the installation of proper control gear in all transformer kiosks. Where several feeders run in the same direction for considerable distances, they have been provided with link chambers which enable any of the outgoing cables to be fed from any of the incoming cables, and provided with circuit-breakers. These arrangements have proved of immense value in dealing quickly with cable faults; and similar arrangements on a minor scale have been carried out in pillar boxes. In several cases the high-pressure cables have been joined up to form ring mains. Several sub-stations have been built in which the transformers have been centralised and provided with switchgear, which facilitates the maintenance of continuity of supply, better pressure regulation, and economy in core losses. In all iron kiosks which have not been replaced by transformer houses, suitable switches and fuses have been provided on both the high-pressure and the low-pressure sides.

The three-phase four-wire power supply to Newtown is derived from the two-phase system by the Scott method at 400 volts.

The tramways comprise a total of 42.29 route miles, 66.17 track miles, and are supplied with direct-current by underground cables up to two miles from the centre of the town, after which the feeders are carried overhead on the tramway poles. The original feeder cables are of the single-conductor leadless type, bitumen-insulated, with a layer of paper next to the copper and jute serving outside the bitumen. They were laid on the solid system, the best for the purpose where atmospheric disturbances occur, the path to earth from the copper conductor through the bitumen insulation and filling and the trough being a long one. Unfortunately, a telephone cable with earthed lead sheathing was laid in the same trough as the feeder, and the latter was connected with the trolley line through fuses by lead-covered cables in the tramway poles; the phenomenal storms experienced in Johannesburg quickly found out these weak spots. The telephone cable system became alive at 500-600 volts, and was rendered useless; the traction cables broke down to the earthed lead sheathing of the telephone cables, causing long stoppages, and the line connections were pierced where the lead sheathing touched the poles. To relieve the system from such troubles, all the paths to earth that could be got at were cut out, the telephone cables were pulled up whenever possible, insulated cable without metallic sheathing was substituted for the line connections, and British Westinghouse lightning arresters were fixed at quarter-mile intervals on the overhead equipment. Porcelain insulators replaced the original compressed-fibre insulation of the trolley line, and have stood up well against the severest electrical storms. Disconnecting switches have been installed on the line connections, and arrangements have been made to link up the feeders and to confine the area of stoppage due to a breakdown to a minimum. Whereas formerly some portion of the tramway service was interrupted during every storm, such interruptions have been almost wholly eliminated.

The tramway system as originally laid down was hampered by no Government regulations, and naturally, therefore, no precautions against electrolysis by stray currents were taken. In 1913 the Government formulated regulations practically identical with those of the British Board of Trade, necessitating the partial reorganisation of the traction supply and the erection of rotary-converter sub-stations at three points, fed with two-phase current at 3,300 volts. The secondaries of the single-phase transformers are double Scott-connected, with two distinct windings, to give a six-phase supply to the a.c. side of the rotaries, which are provided with starting motors and are self-synchronising.

The public street lighting of the inner area was originally carried out with arc lamps, nine in series, but was unsatisfactory owing to frequent faults on the cables, which were rubber-insulated and lead-covered, laid direct in the ground without protection. An average of at least four faults per week occurred on these mains, and in wet weather five or six sometimes took place in one day. The cable being hopeless, the arc lamps were temporarily replaced by large half-

watt lamps or clusters of ordinary metal-filament lamps fed by new steel-armoured cables from the mains. A complete scheme of arc lighting with centralised control has been devised, but lack of funds prevents its being carried out.

From 1909 to 1914 the number of connections increased from 5,720 to 16,091, and the total units consumed from 11.3 millions to nearly 25 millions; the maximum load from 5,300 to 10,900 kw., and the number of street lamps from 5,340 to 7,400. The undertaking is equal in point of magnitude to the whole of the other municipal undertakings in South Africa.

AN ELECTRIC BATTERY LOCOMOTIVE.

SOME eighteen months ago the Midland Railway Co. put to work a battery-operated electric locomotive for shunting and sorting the coal traffic in the West India Dock Depot, London, which investigation showed could be performed more satisfactorily and economically in this way than by horses, hydraulic or electric capstans, and snatch-heads. As the ordinary steam locomotive cannot enter the yard, the whole of the work had to be performed by the electric locomotive.

The maximum speed attained with full load is about seven miles per hour, speeds up to 12 miles per hour being attained with light loads; the rated capacity of the locomotive is six

ELECTRIC BATTERY LOCOMOTIVE, MIDLAND RAILWAY.

loaded wagons weighing 15 tons each, and 12 light wagons of approximately six tons each.

The weight of the locomotive complete with battery is 17½ tons, and the wheel base, which is, of course, rigid, is 8 ft. 6 in.

The general appearance and method of construction of the locomotive is well shown in the accompanying view. It is fitted with two 22-h.p. motors—one per axle—supplied by Messrs. Dick, Kerr & Co.

The battery, which is situated in the two end compartments, was provided by the D.P. Battery Co., and consists of 108 cells, 21-plate T.L. type, with a capacity of 300 ampere-hours. The cells are the D.P. standard train-lighting pattern in lead-lined teak boxes, and are fitted with "block" type lids.

The locomotive has not been out of service at any time on account of the failure of the battery, and no single cell has failed since put to work about 18 months ago. The battery has been in daily use (except Sundays), the discharge rate varying from 40 to 90 amperes, with occasional spurts up to 150 amperes.

The battery is charged every day from about 12.30 p.m. for one to two hours, and a "refreshing" charge is given in the early morning.

When the battery was cleaned out the work was done without interrupting the service in any way, and the plates were found to be in excellent condition, despite the severe jolting occasioned by continual shunting of the coal wagons. Out of over 2,000 wood separators in the battery it was found necessary to renew only about three dozen, and only very few ebonite sheets were split. This is partly due to the careful suspension of the truck, and also to the tough qualities of the accessories. The four-bar bottom block on which the plates stand, a special feature of the D.P. cell, proved its worth; no shorting had taken place, and there was no indentation, as the weight is better distributed than on the two-bar blocks.

The control is by the ordinary series-parallel method, providing two economical running speeds, but no restrictions are put on the drivers with regard to the use of the other notches; the braking is of the rheostatic type operated by the

main controller, this method being very useful for shunting operations. A band brake with hand operation is also fitted to each axle, being equivalent to the tender brake on steam locomotives.

The mechanical portions of the locomotives are largely constructed of standard wagon parts, e.g., the wheels, axles, draw-gear, &c. The body and cab are of wood, suitably braced with ironwork. The covers over the battery compartments are arranged to drain off all rain water, while both sections are so ventilated that gases given off during charging or working the battery are carried off.

Charging is performed by a motor generator, the pressure of supply from the Poplar Borough Council—400 volts—being too high to offer any advantages for the use of a reverse booster. The generator is differentially compounded, so that after current is switched on, further attention is unnecessary except in the case of a "gassing" charge.

We are indebted to the D.P. Battery Co. for the foregoing particulars.

THREE-PHASE PLANT AT SHIPLEY (YORKS.).

THE first venture of the Shipley Council in public electricity supply was in 1900, when a small generating plant in connection with a Meldrum refuse destructor was brought into use. This plant was soon supplemented by two 240-kw. Parsons direct-current turbo-generators (in 1901), and considerable praise is due to the Council, and to its enterprising engineer at that time—the late Mr. Quinn—for pioneering a type of plant which has proved to be possibly the most important factor in modern electricity supply work.

Further developments followed, and by 1905 the Council's plant consisted of four boilers and four turbo-generators of a total capacity of 1,000 kw. In 1912 the Council, after inquiry, decided that the time had arrived to install a modern three-phase system to meet the industrial requirements of the area, and, having obtained borrowing powers for £30,000, proceeded to put down a three-phase 6,600-volt 50-cycle alternating-current system with rotary converters for traction supply and direct-current lighting and power, thus falling into line with the majority of progressive industrial towns.

BRACING OF STATOR END WINDINGS, SHIPLEY ALTERNATORS.

This new installation was officially inaugurated on February 2nd, the occasion being celebrated by a dinner at which many of those interested in local electricity supply work attended. The new plant includes two Babcock & Wilcox boilers fitted with integral superheaters and chain-grate stokers, with a rating of 20,000 lb. of steam at 160 lb. pressure, superheated to 550 deg. F.; two steam-driven Clarke-Chapman pumps have been provided for boiler feeding. Two Westinghouse-Rateau turbines, running at 3,000 r.p.m., each with a continuous output of 1,250 kw., have been installed; these are coupled to alternators by the Phoenix Dynamo Co., a special feature

of the machines being the heavy steel clamping rings round the stator end windings and the ventilating arrangement, for which air is supplied from two Sturtevant dry-air filters equipped with motor-driven fans.

Each turbine exhausts into a Cole, Marchent & Morley surface condenser capable of dealing with 20,000 lb. of steam per hour.

The new three-phase switchgear was supplied and erected by the British Westinghouse Co., and is of the cubicle pattern designed to take care of future needs; supply is given to a large sub-station in the centre of the town, from which all distributing cables will run, the cable contract for some ten miles of three-core lead-covered cable drawn into ducts having been placed with the Western Electric Co., who have, we gather, supplied the bulk of the cable in use in Shipley.

Two rotary converters have been installed, one of 500 kw. capacity and Westinghouse make, and one of 300 kw. by the General Electric Co., for general direct-current supply pur-

been equipped in accordance with this recommendation, and in every case great satisfaction has been expressed by the draughtsmen.

This system of lighting is used by a certain engineering and shipping firm in the Newcastle area, whose reputation is known all over the world—the engineer of which has stated that he had great difficulty in preventing the draughtsmen using the new lighting during the day time—they declared it better than the natural daylight. We illustrate the pendant and the close ceiling patterns of the "Lumina" fittings in figs. 1 and 2.

Anti-aircraft Lamp Screen.

We have received from Mr. J. W. Beauchamp, manager of the West Ham electricity undertaking, particulars of a new type of lamp screen, for which a patent has been applied for, and which has been designed as an inexpensive method of cutting off upward rays from lamps and avoiding the bright patch of light which usually results from the use of a conical reflector on an incan-

WESTINGHOUSE-PHOENIX TURBO-ALTERNATOR AT SHIPLEY.

FIG. 3.—NEW TYPE LAMP SCREEN.

poses. The electricity works are situated on the Dockfield estate, which, together with two adjoining estates, amounting in all to 50 acres, were acquired by the Council and are now being disposed of for industrial purposes. During 1914-15 1,735,000 units were sold, and for the year nearly completed it is expected that 2,500,000 units will be sold.

We understand from Mr. W. Redmond, the Council's electrical engineer, to whom we are indebted for these particulars and under whose supervision these extensions have been carried out, that the new plant is giving every satisfaction, and that the coal consumption has been reduced by 50 per cent.; moreover, some of the local factories have already been connected to the new system, and others are in prospect.

descent lamp. We understand that in practice it gives a very fair distribution of light.

Figs. 3 and 4 show the construction and application of the screen which is made of sheet tin, and is being placed on the market by MESSRS. FALK, STADELMANN & CO., of Farrington Road, E.C.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

The Lighting of Drawing Offices.

For the lighting of drawing offices, the BRITISH THOMSON-HOUSTON Co., of Mazda House, Upper Thames Street, E.C., usually

B.T.H. "LUMINA" SEMI-INDIRECT LIGHTING FITTING.

FIG. 4.—NEW LAMP SCREEN IN USE.

The reduced brilliancy required by the authorities can be most effectively obtained by using lamps of smaller candle-power or under-running or frosting; the practice of covering the lamp with an opaque coating is ineffective owing to the difficulty of maintaining it, and because by increasing the temperature, it shortens the life of the lamp. It is, in fact, obvious that the methods at present adopted for securing reduced illumination of our streets are crude and wasteful.

advise the use of Mazda half-watt type lamps in their "Lumina" semi-indirect lighting fittings. A number of drawing offices have

THE FUTURE ORGANISATION OF ELECTRICITY SUPPLY.

[COMMUNICATED.]

CONSIDERABLE interest is attached to the circular issued a short time ago by the South Metropolitan Gas Co., inviting subscriptions to the company's stock by their consumers, in amounts of £5 and multiples thereof, at the price of £82 per £100 of stock. This investment, with gas at its present figure of 2s. 10d. per 1,000 ft., yields £5 7s. 3d. per cent., which is undoubtedly attractive; indeed, one is tempted to wonder at the Treasury giving their sanction to what must be a competitor to the War Loans. However, the scheme is distinctly interesting, and worthy of some consideration. The war will end sooner or later, and a difficulty will probably be found in raising capital for the many extensions and enterprises which have, perforce, been held in abeyance.

The issue of "Baby Bonds," as they are termed in America, has long been in operation in that country. The advantages of spreading a considerable portion of their stock amongst their consumers and employees have been realised by the companies, and used as a bulwark against the municipalisation of their properties and the undermining of their consumers by the gas opposition. The plan of giving consumers a direct holding and interest in their electric supply company has undeniably done much to restrain municipalities from undertaking work in this direction. One cannot help being forced to the conclusion that up to the present such enterprise has been against the development of the electrical industry in its broadest possibilities.

With the first boom of electric lighting, numerous provisional orders were granted in this country to small towns and districts; some of these were not even taken advantage of, but were merely obtained to block private enterprise. Nevertheless, at that stage a great impulse was given to electrical progress, but the cream of the possible lighting load having been obtained, most of these small municipal concerns have found themselves handicapped by the difficulty of obtaining powers for the hire of motors and apparatus. The fullness of time has shown that the effect of these small undertakings, with their cast-iron boundaries and restricted powers, has been to put the brake on still greater expansion by means of companies or authorities generating on a grand scale with the efficiency of big units and the advantages conferred by large diversity factors. Many of these concerns may be said to be in a state of polarisation, affording little or no profit to their owners and scant opportunity to those requiring cheap light and power.

The present chaotic condition of London's electric service is an example of this. We have numerous comparatively small areas supplied by municipal undertakings which are working under the disadvantages referred to, and companies who are deterred by the shortness of their tenure from exerting their full powers. So far, the various schemes put forward for solving the question of a comprehensive and cheap supply for this city have been abortive.

Much the same state of affairs obtained in the early development in America, except that in their case most of the towns and districts were catered for by companies. Therefore, as the advantages of amalgamation have been realised, it has been possible to assemble small operating companies into large holding companies. An American contemporary classified the advantages to be obtained into several divisions; briefly, they were:—

Efficiency.—Operating efficiency is greatly increased because the directing officers of large holding companies are the ablest men in the business, who contribute expert knowledge, superior administrative ability, and sound judgment. Those superintending actual operations possess abilities which command larger salaries than are obtainable in the smaller companies, and the benefits of their supervision are distributed among a large number of properties at a comparatively small expense. Holding companies have on their staffs expert engineers. Such engineering service is impracticable in small concerns. Alert, legal

supervision is maintained, which is frequently of great importance but usually too expensive for a small company. Departmental operating costs are closely kept, carefully analysed and compared. Publishing and advertising can be co-ordinated and directed into the most profitable channels.

Economy.—In addition to the economies resulting from efficient operation, there are economies in the purchase of material by bulking the orders. The holding companies are always in touch with the markets, and are able to take advantage of cheap prices in any commodity or article, and to buy in advance of rising prices.

Holding companies, by the creation of large issues of securities based upon securities of subsidiary companies, give to this class of security a broad market. They distribute the risk among a large number of properties in different parts of the country, so that any adverse circumstance affecting one property does not materially injure the integrity of the security as a whole.

To sum up, it is claimed that the advantages rendered to the community are better service, cheaper service, broader service in populous centres, and service extension to village and rural communities.

The selling of "Baby Bonds" to consumers, which is a part of the policy of holding companies, has been reduced to a fine art, and almost every conceivable talking point is tabulated. Many of the arguments advanced are ingenious, but not of a nature to appeal to a British investor, who appears to prefer a certain stateliness in the dressing of a financial statement for his consumption. The issue of stock in small units, enabling small consumers to invest, and so acquire a real interest in the industry, has several very obvious advantages. It turns each holder into a friend, who will do his best to forward the development of the company amongst his acquaintances. This is an active influence, and is likely to do more good than the reliance on public spirit and civic pride, which it was hoped would do so much to foster municipal undertakings.

The popularity in America of the "Baby Bond," and of similar issues made in this country, invites the consideration of the extension of the principle to such a public service utility as electricity supply. In fact, it is nibbled at when deposits bearing interest are enforced, but as such they are usually a source of annoyance, operating against the supply authorities' welfare.

The present state of affairs is that with the idea of public control, huge monsters such as the Port of London Authority and the Water Board have been created. Most of these are financed with moneys borrowed upon public credit, and one could fairly safely say against the wishes of half the rate-payers concerned, who, however, seldom obtain the control that they are supposed to exercise, by reason of the multitude of questions generally involved at election times. This remark is not made as an attack on these services or with a view to belittling their work, but merely to emphasise the small amount of public control actually existing.

Assume that instead of forming such trusts on public credit, they took the form of companies with the controlling capital issued in small bonds. The board of directors would contain certain representatives of the municipalities whose districts were affected, much on the lines of the last L.C.C. scheme, who would be charged with the duty of seeing that the interests and rights of the community were protected. The affairs of the company would come up for revision at the usual general meetings, and where a vote was required it could be taken upon the direct issue with no consideration of politics supervening. One ventures to think that a more businesslike administration and better management would result.

No doubt the question bristles with difficulties, but it should not be impossible to discover some method which would open the way for a cheaper and more general supply of electricity. Some discussion of the subject may forward the question to a stage where it will be ripe for practical steps when the passing of the war leaves us free to act again. It may be that the application of the principle of the "Baby Bond" can be made in a way that would help to smooth the path for the large composite bodies that appear to afford a solution of the present state of deadlock. It will also be borne in mind that money is

changing hands, and there will be many small people with money to invest who will only be attracted by a class of investment which is sound. One with the possibilities and assured future of electricity supply should be well in favour if we work to deserve it.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Cause of Flicker.

I have under my charge three Belliss-Crompton D.C. generating sets, rated at 50 and 100 kW. at 450-550 volts, operating a three-wire overhead network, with Crompton's C.M.B. balancers. Only one machine is at present working at once, and the load is metal-filament lamps and fans.

We are experiencing trouble with a flicker in the lights, which seems to synchronise with the engine beat, and we are unable to find any cause for it. It does not always occur, but is sometimes scarcely noticeable, and at other times it becomes objectionable. All machines seem to be affected, but not to the same extent, the small set being the worst, and one of the 100-kw. sets. The third set very occasionally gives trouble, and then only slightly, and we have found that changing over to this set will stop the trouble. The flicker seems to start at half load on the first two machines, when the bus-bar voltage is about 485-490. The machines have only been in use two years, but this flicker was noticed from the beginning.

I should greatly appreciate any information or advice that your readers can offer as to the cause and remedy of this trouble.

F. C. Bulsara.

Nagpur, India, January 29th, 1916.

German Interest in Swiss Concerns.

In your valued paper issued January 28th, under the heading of "War Items," you have printed an article dealing with the German capital invested in Swiss concerns, in which you state that the Swiss journal, *Elektro-Industrie*, the paper of the Association of Electrical Contractors in this country, has expressed its sympathies for the Central Powers. This statement is apt to be misunderstood by the majority of your readers, who will wrongly be led to believe that the Swiss electrical contractors are to a large extent sympathising with the enemies of Great Britain. We feel it our bounden duty to challenge this view. Even if a few members of the Swiss Association of Electrical Contractors should in consequence of personal relations and, last, but not least, through lack of understanding of other people and nations and ignorance of conditions existing abroad, sympathise with the German cause, the majority of us have long ago realised that a too powerful commercial supremacy of one group of the Powers will endanger our economical and political independence. Our trade had suffered a great deal from disloyal German competition long before the outbreak of the war. The article in the *Elektro-Industrie*, written in favour of the German electrical trade, proves that in Switzerland both opponents in a dispute get a hearing, but it does not follow that it expresses the views of all its readers.

In conclusion, we should like to explain that the "blackade" policy practised in England and France against neutral Switzerland is hitting our trade badly, and we are wondering whether it will dawn on the Allies some day that their action in binding industrial forces over here that might be useful to them tends to strengthen the position of the German industry in Switzerland. It must be noted that the Germans are already organising themselves in order to win back the Swiss market after the war, if possible to a still larger extent than in pre-war times, and it looks as if they will succeed unless the Entente Powers discard their over-anxious policy of mistrust against Switzerland.

Théodore Schwarz.

Basle, Switzerland, February 15th, 1916.

City Guilds' Subject: "Electric Wiremen's Work."

"Electric Wiremen's Work" concerns not only wiremen, but also a much greater number of people who are intimately concerned with and interested in what might otherwise be termed "Everyday Electrical Applications." These other people are contractors, foremen, architects, charge electricians, inspectors, builders, clerks of works, students who will one day take up one of these callings, other students, and many others.

The subject (to quote another writer) deals (or should deal) first, with the elementary electrical principles involved; secondly, with the hundred and one kinds of consuming devices and accessories that are to (or should) be found in

ordinary electrical installations (houses, shops, offices, small workshops, &c.); thirdly, with the simple theory of their construction and working; and, lastly, with the various methods of "wiring them up."

The above shows the fundamental importance of the subject, and the City Guilds' report for last session proves how grossly it is neglected by those in authority in some of our technical colleges, institutes, and polytechnics.

On page 20 of the Report we find that "Electrical Engineering" was taught at 117 centres last session, and "Electric Wiremen's Work" at only 57. Turning to page 22, we find, further, that there were 1,341 candidates for examination in "Electrical Engineering," and only 233 in "Electric Wiremen's Work." The 1,341 above does not, by the way, include those taking telephony, telegraphy, and electro-metallurgy. These figures indicate a very topsy-turvy condition of things, and prove that fundamental training in applied electrical work is to a great extent ignored by those whose duty it is to foster it.

For every student who is investigating the mysteries of dynamo design, alternating-current work, transmission systems, electrical instrument making, &c., &c., there should surely be a dozen or so who only desire a working acquaintance with everyday electrical matters.

It would be absurd, of course, to depreciate the value of the subjects included under "Electrical Engineering" in the City Guilds syllabus. But it seems quite evident from the above-quoted figures that we are paying too much attention to what might be termed exclusive subjects, and neglecting another subject which, if properly handled, should be spreading everyday electrical knowledge amongst thousands of people yearly. This would be to the ultimate benefit of the whole electrical profession and industry.

It is a fact, we believe, that in many institutes the students, though they have practical tuition in jointing, &c., are not treated to lectures based on the "E.W.W." syllabus, but have to attend the elementary electrical engineering classes. This, obviously, is very unsatisfactory.

Had things not been as they are, we should not, perhaps, have had *The Wireless World* saying in its February issue (p. 734) that the City Guilds Institute was "not really very well known"! A rather remarkable statement, considering it has been carrying on its work for about 35 years.

A. P. Lundberg & Sons.

London, N., February 21st, 1916.

WAR ITEMS.

Enemy Companies.—The "Times" states that the committee appointed to advise the Board of Trade in tackling companies of enemy nationality or association held its first meeting on February 17th. The affairs of four companies were gone into, but as the proceedings were private no decision was announced.

In the House of Commons, on Monday, in reply to a question, Mr. Pretyman stated that the committee had numerous cases before them. The list of persons, firms, or companies whose businesses might be ordered to be discontinued wholly or partially or wound up would be laid before both Houses from time to time, and notices of such orders would be gazetted. There would be no unnecessary delay, but it was desirable to pass all the names through the committee. It was difficult to draw the line as to exactly whether a firm should come before the committee or should not. In reply to another question, Lord R. Cecil said that the black list under the Act was in an advanced state of preparation, and publication would be commenced shortly.

Westinghouse War Relief Fund.—We have before us a copy of the balance sheet down to December, 1915, of the British Westinghouse Employe's War Relief Fund. A meeting of the delegates was called for yesterday evening at the British Westinghouse Club, Moss Road, Manchester, when Mr. J. H. Tearle was to preside. During the period from August, 1914, to December, 1915, the contributions by employe's amounted to £13,648, and that contributed by the company was £6,291; adding a small sum for donations and bank interest received, the income was £20,038. The payments to dependents were £12,047. Christmas gifts stand at £885. Donations were sent to local hospital, Red Cross, and other funds to the tune of £500, and national donations were £680. There has been transferred to the Widows' and Orphans' Fund £4,000, and a balance of £2,312 remains at the bank. The Widows' and Orphans' Fund is almost entirely invested in Treasury Bills.

Tramcar Lighting Prosecution.—At Blackpool, on February 18th, Arthur Bolton, tramcar conductor, was summoned for failing to obscure the car lights. Three other conductors were summoned for similar offences. The car in question was seen standing in Talbot Square with 13 lights switched on, and they were visible seawards. No blinds were drawn. The Chief Constable said he had brought these matters to the notice of the tramway people time after time. Some of the complaints had been attended to, and some had not. A fine of 20s. was imposed in each case.

Trading with the Enemy.—The Board of Trade has appointed Sir Edwin Cornwall, M.P., to be a member of the Advisory Committee in connection with the Trading with the Enemy Amendment Act, in place of Sir George Croydon Marks, M.P., who, owing to work under the Ministry of Munitions, cannot serve. Sir George is at present acting as Special Commissioner in the Tyne district to deal with the inauguration of schemes for the dilution of labour.

Use of Electric Torches.—The use of electric torches in Essex has become so great that the Chief Constable has issued a notice to all superintendents in the county that in future proceedings will be taken against any person displaying any light in such a manner as to serve as a signal. Unless the nuisance is abated, an order will be made by the competent military authority prohibiting the use of electric torches in the open.—“Times.”

IMPORTS OF HOLLAND.

The following figures, showing the imports of electrical and similar goods, for consumption, into Holland during the year 1914, are taken from the recently-issued official trade statistics; the figures for 1913 are added for purposes of comparison, and notes of any increases or decreases are given:—

REVIEWS.

Dielectric Phenomena in High-Voltage Engineering. By F. W. PEEK, JUN. London: Hill Publishing Co., Ltd. Price 12s. 6d. net.

The author sets out in this book the properties of gaseous, liquid, and solid insulators, and the methods of utilising these properties to the best advantage in the problems of high-voltage engineering. Methods that have proved useful in designing apparatus, transmission lines, insulators, bushings, &c., are discussed and illustrated by practical examples. In addition, such subjects as the manner of making extensive engineering investigations and of reducing data, the measurement of high voltages, the effects of impulse and high-frequency voltages, methods of drawing dielectric fields, outline of modern theory, various dielectric phenomena, &c., are considered.

A great deal of original work is described (and this is what makes the book so valuable), and there is ample reference to other investigations. It is interesting to note that the author's extensive research was made possible by facilities afforded by the Consulting Engineering Department of the General Electric Co. His work has to do chiefly with the "visual" corona, which may be defined as follows:—If potential is applied between the smooth conductors of a transmission line and gradually increased, a voltage is finally reached at which a hissing noise is heard, and if it is dark, a pale violet light can be seen to surround the conductors. This voltage is the critical visual corona point. If a wattmeter is inserted in the line, a loss is noticed. When alternating voltage higher than the critical voltage is applied between two parallel polished wires, the glow is quite even, but after operation for a short time reddish heads or tufts form along the wire, while round the surface of the wire there is a bluish-white glow. If the conductors are examined through a stroboscope, so that one wire is always seen when at the positive half of the wave, it is noticed that the reddish tufts or beads are formed when the conductor is negative and the smoother bluish-white glow when the conductor is positive. The author gives particulars of different sets of experiments in the study of corona, amongst others the effect of spacing and size of conductor, the effect of temperature (the experiments varied over a range of - 20 deg. C. to 140 deg. C.), effect of oil, water, or dirt on the visual point. Tests made over a very wide humidity range show that humidity has no appreciable effect upon the starting point of visual corona, but after corona is present, humidity has an effect on the spark-over voltage. Change of initial ionisation of the air, even to a considerable extent, has no appreciable effect on the starting point of corona. A test was made to see if heavy current flowing in the wire would change the starting point, but it was found that such current does not appreciably affect it unless the temperature of the wire is increased.

Especially interesting is the author's photographic study of corona on wires and cables. The method adopted was as follows:—Two parallel conductors were spaced 122 cm. between centres. The camera was focused on one conductor only. The distance to the lens was such as to show the conductors at approximately actual size. An exposure was made for a given time at a given voltage. The plate was then shifted slightly, the voltage increased, and a second exposure was made for the same time. Thus a given series shows the same part of the same single wire at different voltages.

Two photographs are given showing the effect of moisture. A stranded cable was brought up to the critical point, and water was then thrown on it. What was a glow at the surface of the dry cable became, at the wet spots, a discharge extending from 5 to 8 cm. from the conductor surface. Other

photographs show the corona on bright tinned phosphor-bronze wire, on copper wire polished after each exposure, on weathered galvanised iron wire, on a polished brass rod, and unpolished copper cable, and so on.

The author is to be congratulated on the quantity and quality of the original work he has done. The account of his extensive experiments on high-voltage electricity is exceedingly interesting, and his descriptions of apparatus are always clear and his photographs excellent.

Rubber Machinery. By HENRY C. PEARSON. New York: 1915. The India-Rubber World Press. Price 68s in U.S.A., post free.

Mr. Henry C. Pearson is the editor of the *India-Rubber World*, the chief organ of the rubber trade in the U.S. But besides being a most successful and brilliant technical journalist, he is, and has always been, a practical rubber man, keenly alive to every phase, past, present, and future of the rubber industry. As a result, he has in the past produced works, such as "Crude Rubber and Compounding Ingredients," which are to be found in the reference library of every self-respecting rubber manufacturer. His latest effort, *Rubber Machinery*, is perhaps the most useful of the series, for while—as the author points out in the preface—"mechanical and inventive ingenuity" has been producing machinery for use in rubber manufacture "for fifty years, this volume is, so far as we are aware, the first published work at any rate in the English language, dealing comprehensively with rubber machinery." There have been many rubber books in which typical machines have been features in illustrations of processes, but none in which the processes have been referred to merely to explain the machines. Technical works dealing with machinery are frequently no more than a series of illustrations from manufacturers' catalogues strung together on a thin chain of uncritical letterpress. Such works serve, perhaps, to remind us of much that we had forgotten, but they are scarcely stimulative of thought. Mr. Pearson's volume does not belong to this class; he writes with discrimination as well as with skill. His object, he states, is "to record the machines that are of general application either to all or to a number of the lines into which the trade is divided." To this end, he tells us, "voluminous matter has been collected from machinery makers the world over; from rubber factories, from patent specifications—American, English, German, and French. The actual value of such a collection to the rubber manufacturer, whatever his line, should be great, but the *suggestive value* (the italics are ours) will be even greater." In our view, Mr. Pearson has very largely achieved his object, but his success in this regard is not due entirely to "collecting voluminous matter" from various sources; without the author's practical knowledge of the industry and the exercise of his critical faculty it might have been a poor thing. As it is, however, the volume should find its way to the shelves of all those whose work brings them into contact with rubber machinery. The book is sub-divided into twenty chapters; of these, the first two are devoted to machinery used in washing and drying crude rubber; Chapters III and IV deal with the handling of mixing materials and the process of mixing; Chapters V and VI with calendars and plant for preparing fabrics for calendaring and spreading; Chapter VII with clutches, drives, and safety stops for mills and calendars; Chapters VIII to X with vulcanising plant, materials, and methods. Chapter XI is a useful contribution on the subject of tube-making machinery, while the two succeeding chapters are devoted to spreading, doubling, and finishing plant. Chapter XIV, on cement and solution machinery, is the last on what may be termed rubber manufacture proper. After a couple of chapters on the extraction of rubber and gutta from shrubs, vines, &c., and of resins from low-grade rubbers, we have (Chapters XVII and XVIII) a very interesting section dealing with reclaiming. Chapter XIX, on temperature recording and controlling devices, will be of more than passing interest to those (and they are many) who have endured losses and worry as the result of over- or under-vulcanising. The concluding chapter is on rubber laboratory equipment, and in this, we think, will be found much that is suggestive even to those whose work lies wholly in the laboratory. Here and there we meet with views or statements that are capable of criticism; for instance, the authors' estimate of the capacity of certain types of crude rubber washing plant appears to us to be rather high; again, the views expressed on the subject of the "nerve" of crude rubber and methods of determining it will scarcely meet general acceptance. They appear to be based on some recent publications of Caspari's, which will, however, require a great deal of confirmatory work before the somewhat sweeping deductions made from them can find practical application. These and other minor blemishes do not, however, affect the character of the book as a whole, nor need they interfere with our congratulations to Mr. Pearson for having given us a most valuable and interesting work.

British Trade Interests in Denmark.—An Exchange dispatch to the *Times* states that a special British Commercial Adviser has joined the British Legation at Copenhagen.

LEGAL.

MOTOR CAR v. TRAMCAR.

STIPENDIARY NELSON has issued judgment in the Glasgow Police Court in the prosecution of a Glasgow T.C. motor-man who was charged with recklessly driving the tramway car under his charge, and causing it to collide with a motor-car and damage the vehicle and injure its occupants. The impact was so great that the tram-car was forced off the rails. Dealing with several authorities which had been submitted to him, the Stipendiary said the principle laid down in *Macanodre & Tillard* (1909) clearly applied to the present case, so as to primarily lay the responsibility of avoiding the collision upon the vehicle which was emerging from a small side street upon an important public thoroughfare on which there were tramway rails along which, according to the Board of Trade regulations, it was lawful for a tramway car to travel at a rate of sixteen miles per hour. A motor-car was a much more mobile vehicle than a tramway car, and therefore the chief responsibility for the avoidance of danger lay upon the motor-driver. He found the charge against the motor man not proved.

MUNITIONS COURT CASES.

At the Manchester Munitions Court on Saturday, a firm of electrical engineers summoned Messrs. Humphrey Lloyd & Sons, for engaging a youth named Carnall and taking him away from a controlled establishment. The case was brought under Sec. 12 of the Amended Munitions Act, and it was stated for plaintiffs that they had warned defendants that they were infringing the Section by employing Carnall. Defendants' statement was that Carnall replied to their advertisement for a clerk, and he was engaged subject to his references being satisfactory. Plaintiffs subsequently informed them that theirs was a controlled establishment and that they could not spare Carnall, whereupon Humphrey Lloyd & Sons informed the youth by letter that they could not continue the engagement. On the following day, February 8th, Mrs. Carnall called and the youth also wrote, and both stated that he was not employed on munitions, that he had no badge, and that he would not return to his old place. Defendants, added the statements, were not a munition firm, and as the statements seemed satisfactory, the defendants kept the youth at work. The defendant firm were fined £3 and the youth £1, the latter not to be enforced if he returned to his work by the following Wednesday.

An electrical fitter employed by the Admiralty at Sheerness, last week applied for his discharge, on the ground that as overtime had been abolished, his wages were insufficient to keep himself and his home going at Ashton-under-Lyne. He desired (according to the *Standard*) to get work at Manchester. There were six fitters, two labourers, and an assistant doing the job which one man did before the war. A representative of the Admiralty said that no overtime was promised, but the man worked overtime from February, 1915, to January last, his average earnings being £4 6s. 3d. a week. There was a difficulty in getting electrical fitters, and the Admiralty had to keep up a large staff to deal with any emergency that might arise. The certificate was refused.

GROCOFT v. LOVATT & BOOTH.

At Staffordshire Assizes last week, before Mr. Justice Avory and a jury, Richard Thomas Grocott, tracing as Gaskell & Grocott, manufacturers of electrical earthenware fittings, of Longport, near Burslem, brought an action against Joseph Lovatt, general secretary, and Jabez Booth, organiser, of the National Amalgamated Society of Male and Female Pottery Workers, to recover damages for libel.

According to a report in the *Manchester Guardian*, Mr. Graham, for the plaintiff, said that he claimed damages for a libel contained in a handbill issued on May 25th last. In that month there was considerable agitation not only in the pottery trade, but in most other trades all over the country, for an advance in wages on account of the increased cost of living. This was shared by the workpeople at Longport, and on May 7th Mr. Lovatt, general secretary of the Union, wrote to the plaintiff's firm stating he was instructed by the operatives to ask for an advance of 10 per cent. in wages to all day wage and piece workers on account of the increased cost of commodities. This appeared to be an entirely gratuitous interference between Mr. Grocott and his workpeople, because the vast majority of them belonged to a special Union which looked after the interests of their particular branch of the trade. The plaintiff took no notice of the letter or of a similar letter written a little later, in which it was stated that the manufacturers had agreed to pay a bonus of 7½ per cent. Recognising the general demand for an increase of wages as being a just one, Mr. Grocott, in common with most other employers in the district, granted of his own accord a war bonus of 7½ per cent. to his employes, and paid it for the first time upon May 22nd, for the week beginning May 15th. Three days later a handbill was distributed outside the works. It conveyed a meeting and stated that the business to be discussed was the 7½ per cent. war bonus, and added "If you are anxious to secure the war bonus, attend this meeting. You can only obtain it by joining this society. Now is the time to join." The plaintiff complained of this as being a libel upon him, because it implied that he was not at the time paying the war bonus as other employers were doing.

MR. MILWARD, for the defendants, asked the jury to say that

there was no libel and no intention to libel the plaintiff. He pleaded that his clients had no knowledge of the handbill.

The JUDGE said the jury knew how dangerous it was in these days when the relations between employers and employed were delicate to ruffle or disturb relations between masters and men which were amicable. In this case there appeared to be no ground for the imputation alleged, because the plaintiff was already paying the war bonus when the handbill was issued, and this fact could easily have been ascertained from any of the plaintiff's workpeople.

The jury returned a verdict for the plaintiff, and assessed the damages at £200.

THE LIGHTING OF KINGSTOWN.

THE Court of Appeal, Dublin, was last week, engaged considering an appeal brought by the Dublin Southern District Electric Supply Co., Ltd., from a decision of Mr. Justice Barton, refusing an application for an order directing the Taxing Master to tax the costs of the company against the U.D.C. of Kingstown, on the scale provided for by the Acts for the taxation of Parliamentary costs, or, in the alternative, directing that the costs should be taxed as Chancery costs on the higher scale, as between solicitor and client, or for such other order as the Court might deem reasonable. The case related to the arbitration proceedings between the Kingstown U.D.C. and the Dublin Southern District Electric Supply Co., in connection with the Kingstown lighting scheme.

On Monday the Lord Chancellor said that the view of the Court was that the appeal should be dismissed with costs, but as some questions of general importance had been raised with which it would be necessary to deal, they would deliver a considered judgment as soon as possible.

FARRELL v. BLOXAM

BEFORE Mr. Justice Gibson and Mr. Justice Pim in the King's Bench Division of the High Court of Ireland, application was made on defendant's behalf for an order changing the venue of trial from the City of Belfast to the City of Dublin in the case of Mr. A. B. Farrell against Mr. T. W. Bloxam. The action has already been referred to in our pages.

In the result the Court changed the venue to the County of Antrim, costs to be costs in the cause, Mr. JUSTICE GIBSON remarking that this would enable plaintiff to have justice and to have the action tried (at Assizes) as cheaply as possible.

THE SWISS MACHINERY INDUSTRY.

THE importance of Switzerland as a producer of machinery and competitor in the markets of the world is clearly illustrated in the annual report which was recently published by the Swiss Association of Machinery Manufacturers (Verein Schweizerischer Maschinen Industrieller). Although the report does not contain any record of the total output of machinery of all kinds in that country, it quotes details of the import and export trade in 1913 and 1914, and mentions that the number of works belonging to the Association was 154 in 1914 as against 155 in the previous year, whilst the workmen and apprentices, of whom one apprentice to 10 workmen appears to be the rule, comprised 36,123 and 43,081 in the two years respectively. As will be seen from the accompanying table, the total imports of machinery declined from £2,298,000 in 1913 to £1,647,000 in 1914, the reduction being entirely due to fewer deliveries being received in the second half of the year:—

TOTAL VALUE OF FOREIGN TRADE IN MACHINERY.

	Imports.	Exports.
1913 ...	£2,298,000	£4,473,000
1914 ...	1,647,000	3,561,000

There is no reason for assuming that the native makers secured any substantially greater share in meeting home requirements as a result of the diminished imports in 1914, as the decrease was rather due to the general depression in the purchasing industries through the war.

As might be expected from its geographical proximity and great industrial development, Germany occupied the principal position in the Swiss import trade, the deliveries from the former to the latter having been £1,600,000 in 1913 and £1,112,000 in 1914, or 70 per cent. and 68 per cent. of the total Swiss imports in the two years respectively. On the other hand, the exports from Switzerland to Germany only receded from £720,000 to £680,000 in 1914. The exports to Austria-Hungary decreased from £196,000 in 1913 to £140,000, but the imports from the dual monarchy are only mentioned in the sense that Austro-Hungarian machinery participated in the total exports from Switzerland to the amount of 4 per cent. in both years. The imports from France fell by £80,000 in 1914, and the Swiss exports to France also diminished by £124,000. In the case of Italy the Swiss imports receded by £8,000 and the exports by £40,000.

The Swiss trade with Great Britain is set forth in the report separately for the first time. The imports are given as having been of the value of £113,000 in 1913, as contrasted with £69,000 in 1914, whereas the Swiss exports are returned at £217,000 and £210,000 in the two years respectively, a substantial advance having taken place in dynamos and milling machinery. The report emphasises the great loss of trade which occurred in the most important market for Swiss machinery, namely, Russia,

where a decrease of £228,000, or 33 per cent., took place in 1914; a diminution of £200,000, or over 50 per cent., took place in the case of South America, and one of £108,000, or 37 per cent., in the trade with Spain, as compared with 1913. The table which next follows also records the foreign trade in electrical and certain other machinery in the years set forth:—

	Imports of electrical machinery.	Exports of electrical machinery.
1910 ...	£48,000	£626,000
1911 ...	40,000	721,000
1912 ...	59,000	689,000
1913 ...	61,000	814,000
1914 ...	55,000	623,000

FOREIGN TRADE IN CERTAIN OTHER MACHINERY.

	Imports.		Exports.	
	1913.	1914.	1913.	1914.
Hydraulic turbines and pumps ...	£29,000	£18,000	£340,000	£260,000
Steam engines and steam turbines ...	34,000	19,000	419,000	236,000
Gas, oil and benzine engines ...	24,000	21,000	476,000	350,000

If the imports are deducted from the value of the exports, it will be found that the latter represented an apparent surplus of £2,175,000 in 1913, and one of £1,914,000 in 1914. It must, however, be borne in mind that Switzerland is a large purchaser of foreign machinery for re-exportation as the report, although not specifically referring to re-exports, gives the share held by various countries in the total exports of machinery from Switzerland in the two years under consideration. If these shares are brought together for the principal countries, the following results in percentages of the values are shown:—

PARTICIPATION OF FOREIGN MACHINERY IN THE TOTAL EXPORTS FROM SWITZERLAND.

	1913.	1914.
Germany... ..	16·3 per cent.	19·3 per cent.
Austria-Hungary ...	4·0 "	4·0 "
France	17·7 "	18·7 "
Italy	8·9 "	10·1 "
Great Britain	4·9 "	5·9 "
Total	51·8 "	58·0 "

The total sum represented by the above percentages of the exports in either year is greater than the total value of the imports either in 1913 or 1914, and the percentages can, therefore, not be regarded as thoroughly reliable. At the same time the figures lead to the assumption, which appears to be wholly justified, that the entire value of the imports of machinery is also contained in the total value of the exports for each year.

BUSINESS NOTES.

Inquiry from Canada.—A Montreal firm having branch stores in Quebec, Ottawa, Toronto, and Vancouver, and travellers throughout the Dominion, wishes to obtain agencies for British electric lamps, &c. Apply Board of Trade Commercial Intelligence Branch, London.

Trade Announcement.—MESSRS. NAPIER, KIMBER, LTD., announce that Mr. R. N. Cunningham is not now connected with the company. He has disposed of the whole of his ordinary shares and resigned his directorship, and Mr. A. W. Kimber becomes principal shareholder and will remain managing director.

British Trade with Russia.—The Board of Trade Commercial Intelligence Branch has issued a special eight-page reprint relating to "Possibilities of British Trade with Russia." It is a memorandum prepared by the Acting British Consul-General at Moscow. We have no space to spare to deal with it at length at present, but we recommend it to the attention of all firms that are interested in our future trade relations with Russia. The writer emphasises the need for organised preparation; shows the necessity for a knowledge of local conditions; and makes a comparison between British and German methods. He discusses four suggested methods of developing British trade:—(1) Local representation; (2) the "Group" agency; (3) commercial banking; establishment of forwarding agents; (4) official visit of British merchants. In conclusion, the principles of successful trade are considered.

Science and Industry in Australia.—At a conference held at Melbourne, on January 8th, the Prime Minister, Mr. Hughes, presiding, it was resolved that an advisory council be established to formulate proposals for a national bureau of science and industry. The Prime Minister said that great industries, primary and secondary, must be stimulated, advised, and aided by scientific industrial research, and by wise laws. Provision would be required for a bureau of standards, and for industrial research; there should be a scheme so broad as to reach right down from the central institution to the preparatory schools, for there was only one way by which the scheme could be effectively carried out—and that was to reach the people when they were young, and to impregnate them with science. Mere money would not be allowed to stand in the way.

The British Industries Fair.—This Exhibition, which has been organised by the Board of Trade, will remain open until March 3rd. It is being held in the Victoria and Albert Museum, South Kensington, and in order not to interfere with the production of munitions of war, the exhibits have been limited to printing and stationery; china, earthenware and glass; fancy goods and toys. Over 100,000 invitations have been issued, but if there are wholesale buyers in any of these trades who have not yet received tickets they can obtain same by applying to the Board's Cheapside offices. Our own impression of the Fair, formed on Monday afternoon, when Her Majesty the Queen made a tour of inspection under the guidance of Mr. Kincman, is that an unqualified success may be expected. We confess to experiencing something in the nature of a shock when we found that the greater part of the ground floor of the Museum had been temporarily cleared of its serious permanent collection in order to make room for collections of dolls, teddy bears with sparkling electrical eyes which lit up by means of a switch at the centre of their frontal curvature, goliwogs, and all sorts of funnionies, but, after all, the Exhibition is a very serious affair, affording very acceptable indications of the efforts that British manufacturers are making in various departments of industry to dispense with German-made goods. Not many electrical articles come under the classification of trades adopted for this event, but those of our readers who visit the Museum should make a point of visiting the stands of the several enterprising firms who are engaged meeting the very large demand that exists for pocket and other portable electric lamps and articles that come within that category. From our conversation with those in charge of such exhibits, we gathered that the spirit of all engaged in this branch of the electrical industry was one of the most thorough-going optimism. What has been done since the outbreak of war, what is being done now, in spite of all the labour difficulties of the time, and what is in prospect for the days when military and munitions demands fall away, altogether make a most interesting story. Some there are who say that British manufacturers were beating German manufacturers in such lines before the first shot in this war was fired, but all are confident that we shall be so strongly prepared that there need be no fear of our losing the market after the war. The Eftandem Co., of Wolverhampton, had an output of 3½ million batteries last year—this year it will be 5 million. Of actual pocket lamps they turned out an average of 35,000 per week from January to December last year, and everything was made at Wolverhampton. There may have been difficulties in regard to glass lenses, but even here English manufacturers are rising to the occasion. The Eftandem Co. are also developing a number of new lines, such as bells and indicators and general novelties in which Germany was to the fore in many parts of the world, and the result is gratifying. On their stand will be found many devices which certainly cannot correctly be called "toys," for we noticed military equipments of electric lamps for fixing on the bridle and on the stirrup, also lamps for shell inspection and trench service, which show the adaptability of the firm for meeting the requirements of the Forces. The British Ever-Ready Co., Ltd., also have what for this exhibition is a comparatively large stand where an excellent range of pocket lamps, portable hand and reading lamps, orches, miners' lamps, dry cells, a cumulators, and many electrical specialities is well displayed. This company has been doing a splendid business for some time past, and we learned with satisfaction of important works extensions for dry battery manufacture which are in hand, concerning which more later we hope. Messrs. Ward & Goldstone, as our readers have already been made aware, are also exhibitors of many of the lines for which they have long been so well known. Pocket lamps and batteries, hand lamps, portable lamps, model motors and dynamos, Ford starting batteries, electric cycle lamps, magneto-electric machines, "Volex" dry battery and electrical novelties are shown in great variety. Messrs. F. Darton & Co. have on display many hand and pocket lamps, model motors and dynamos, model electric boat motors, accumulators and dry cells, car-lighting dynamos, water motors and dynamos for running from household taps, Samson dry cells, and many electrical machines and novelties. But they have developed also very largely their lines of meteorological and other instruments, and are doing well in that department. Messrs. W. A. & R. J. Jacobs Ltd., the Surrey Electrical Co., Ltd., and Mr. T. Baxter also have interesting exhibits of pocket lamps. Here and there the electrical visitor will find other features of interest, and in the pottery and earthenware sections the enterprise of the British manufacturer is very evident.

Catalogues and Lists.—MESSRS. SMART & BROWN, Erith, Kent, have issued a wall calendar, showing in colour one of their motor launches as supplied to the Thames P. 49 last year. **MULDIVO CALCULATING MACHINE CO.**, 4, Olden Victoria Street, London, E.C.—Leaflet relating to the "Muldivo" calculating machine, which is of French manufacture. **SUN ELECTRICAL CO. LTD.**, 118-120, Charing Cross Road, London W.C.—Priced list of "Britannia" metallic-filament drawn-wire lamps. **JACKSON ELECTRIC STOVE CO. LTD.**, 38, Blandford Street, London W.—Illustrated price cards relating to coffee percolators and hot-water urns.

The Schenectady Works.—Some of the London newspapers have published exaggerated reports respecting the recent fire at the General Electric Co.'s works at Schenectady. We learn on the best authority that the damage done is so slight as to be hardly worth mentioning, and that the work of production will not be in the least interfered with.

Bankruptcy Proceedings.—W. C. WILD, electrical engineer, Halifax.—First and final dividend of 5s. 7½d. in the £. payable at Official Receiver's office, 12, Duke Street, Bradford.

G. E. BONNER, electrical engineer, Palmer's Green.—The public examination of this debtor was held at the Court House, Edmonton, on February 21st.

F. H. WATTS, electrical engineer, 40, Mincing Lane, E.C.—Trustee released, December 6th, 1915.

A. J. LOADER, "Medical Electrician," Nelson.—Trustee released, December 13th, 1915.

Liquidation.—ELECTRO STEEL FOUNDRIES, LTD., Darlaston.—March 4th is the last day for the receipt of proofs for dividend, by Mr. H. E. Burgess, the liquidator, 33, Carey Street, W.C.

Inquiry from Brazil.—The Acting British Consul-General at Rio de Janeiro reports a local demand for steel poles for the suspension of arc lamps. Satisfactory supplies have hitherto been obtained from Germany. Supplies of electrical insulators have also been obtained from Germany in the past, and consumers state that they have only been able to secure inferior substitutes from the United Kingdom since the outbreak of war. Samples of insulators of German make have been received from the Consul by the Board of Trade Commercial Intelligence Branch in London, to which communications should be addressed.

Book Notices.—"Wireless Transmission of Photographs," By M. J. Martin. London: The Wireless Press. Price 2s. 6d. net.

"The Rubber Growers' Association, London, E.C. Annual Report of the Council for 1915."

"Thomas Alva Edison," By F. Rolt-Wheeler. London: Macmillan & Co., Ltd. Price 2s. net.

"Proceedings of the American Institute of Electrical Engineers." Vol. XXXV. No. 2, February, 1916. New York: The Institute. Price \$1.

The Committee of Management of the San Francisco International Engineering Congress, 1915, announces that the volume on Mechanical Engineering is ready for distribution, and the members who have subscribed for this volume will soon receive it. The other volumes will be issued as rapidly as possible.

LIGHTING AND POWER NOTES.

Argentina.—A new electric power house was formally inaugurated at Acoelba (Province of Santa Fé) last month. The establishment belongs to Señor Julio Hardy.

La Prensa's correspondent at Tucumán says that owing to the shortage of water, the Electrica del Norte Co. has addressed a note to the municipality, stating that it will be obliged to leave the city in darkness unless the water required for the power station be forthcoming. The Intendant replies that the municipality must adopt measures to guarantee the regularity of the public and private lighting service in terms of the contract. It is believed that this attitude will give rise to a serious conflict, as the municipality owes the company \$300,000 m.n. for lighting. On the other hand, it appears that the company has sought the present pretext with a view to arriving at a settlement.—*Review of the River Plate.*

Atherton.—The electrical engineer has reported that the output is steadily increasing, and will soon reach the maximum load which the Tramway Co. is able to supply until such time as the new generating set is installed.

Bungay.—E.L. SCHEME.—With reference to the E.L. scheme proposed by Mr. Best, of Bradford, the U.D.C. has deferred the question of entertaining the proposal until it is ascertained how similar schemes work in neighbouring towns.

Continental.—SPAIN.—The new central station at Segovia, belonging to the Sociedad Co-operativa Electrica Segoviana, has just been completed and put in operation. Water power is utilised, the plant comprising two Francis-type turbines supplied by Messrs. E. cher, Wyss & Co., of Zurich, and two alternators by the Allmänna Svenska Aktiebolaget, of Stockholm.

ITALY.—A report of the D. manio furnishes details of the natural water resources of Italy utilised for industrial purposes up to June 30th 1914. The concessions granted number 3,161, for the production of 770,000 kw., without taking into account a large number of concerns working without legitimate title, and 2,600 grants under construction. The regions in which the concessions operate are 16 in number, the most important being Piedmont, which has 620 concessions, yielding 216,000 kw. Lombardy has 394 concessions, totalling 205,000 kw., and Umbria with 101 concessions, obtains 100,000 kw. In addition to the foregoing there were granted in the working year preceding June, 1914, 116 concessions for a total of 20,000 kw. The revenue obtained by the State Treasury from the taxation of concessions totalled on June 30th, 1914, 2,871,202 lire, which is exclusive of the income which should have been derived from a number of free concessions, granted under special Acts, representing a total of 33,560 kw.—*Revista Tecnica d'Elettricità.*

Darlington.—**SUPPLY DEVELOPMENTS.**—At a recent meeting of the Electricity Committee it was reported that the supply of electricity for the 10 months of the year was up by 20 per cent., as compared with last year, and that for the last month there was an increase of 40 per cent. on the year, this notwithstanding the reduced use of electricity for lighting purposes.

It was also reported that the contract with the N.E.R. Co. for the full supply of electricity for its works would date from June 1st next.

Dublin.—We briefly summarised last week the statements which were circulated locally regarding the contents of Mr. d'Alton's report on the Corporation electricity undertaking. From discussions which have since taken place in the Council chamber, we gather that all publication in the local papers, whether of the report or of the replies thereto, which have been made by certain officers of the department, is unauthorised officially and is premature. Doubtless Mr. d'Alton regards himself as being bound by those obligations of etiquette and confidence which for the present compel him to maintain silence. Probably when the proper time arrives, the Corporation Committee will officially publish the report and replies, and until then we prefer to withhold any comment that we may desire to make upon the matter.

In addition to the counter reports mentioned last week, Mr. Mangan, the city accountant, has now submitted a report more or less disagreeing with Mr. d'Alton's conclusions. Mr. Mangan apparently does not believe that the load conditions can be greatly improved in Dublin, and urges that in making price comparisons a distinction must be drawn between power and lighting supplies. He evidently agrees that some explanation is needed of recent cost and consumption, but points out that "units used on works" includes energy used at Fleet Street and other sub-stations, and therefore, subject to transmission losses. He further considers that his own analysis of salaries, &c., submitted to the town clerk last June, made this matter clear.

ASYLUM LIGHTING.—The returns of the cost of electric lighting at Richmond Asylum for 1915, as compared with gas lighting in 1911 show a saving of £978, and this although added buildings are now lighted.

Eccles.—There was a surplus of £632 on the Council's electricity undertaking for the year ended March 31st last. This has been carried to reserve.

High Wycombe.—**STREET LIGHTING.**—The Electricity Co. has accepted the terms offered by the T.C. in respect of the public lighting up to the end of 1915, but objects to the proposals of the Council as to payment since January 10th, the date of the new lighting order issued by the Government. The company has asked that the matter shall be referred to arbitration, but the Council has deferred the question until the end of the current quarter.

Huddersfield.—**YEAR'S WORKING.**—It was stated at a recent meeting of the T.C. that the electricity department had used 28,242 tons of coal in 1915, as compared with 20,781 tons in 1914, and that the cost had risen 75 per cent., indicating the possibility of a further increase in the price of electricity. The units sold totalled 10,836,374, an increase of 30½ per cent., due to the demand for power; due to the night work, a considerably improved load factor resulted.

The borough treasurer's revenue statement for the year ended December 31st last, shows a balance of income over expenditure in respect of the electricity undertaking of £3441; £1291 is to be transferred to the depreciation and contingencies account, and the remainder carried forward.

Hull.—**SMOKE NUISANCE.**—The local Health Committee has threatened proceedings unless the smoke emitted from the chimneys at the Sculcoates electricity works is reduced. The acting electrical engineer, Mr. Magoris, has presented a report, pointing out the difficulty of complying with the request at the present time, and this is to be forwarded to the Health Committee. In effect Mr. Magoris points out that it is impossible to restrict capital expenditure, obtain new plant, give the maximum output from the plant and yet study the niceties of smokeless combustion—especially if, as is probable, the staff is depleted.

Kingstown.—**L.G.B. INQUIRY.**—An inquiry has been held into the Council's application for sanction to a loan of £4,000 for the payment of the arbitration award and costs connected with the transfer of the electric lighting undertaking under the Electric Lighting Order Confirmation (No. 8 Kings'own) Act, 1914. No objection was offered. The award was for £3,608, and the costs and fees brought the total up to £4,704. The costs of the arbitration proceedings amounted to £603. The total expense was estimated at £6,327.

Liverpool.—**ANNUAL ACCOUNTS.**—During the year ended December 31st last, the revenue of the electricity department amounted to £345,808, the balance to net revenue was £209,558, and after meeting interest and sinking fund contributions, and providing £50,000 to rate relief, £36,223 was transferred to renewals. The department has a reserve fund of £183,000 and a balance of renewals fund in hand of £97,000; the rate contribution represents about 34 per cent. on the unredeemed capital and 23 per cent. on the income derived from private lighting and power.

London.—**HACKNEY.**—As it is not possible to install two further boilers and economisers in the new boiler house to provide against breakdown, the Electricity Committee recommends that the stoker driving gear for the second boiler installation be provided immediately.

Rawtenstall.—**BULK SUPPLY.**—With a view to giving a bulk supply of electricity to Haslingden a Sub-Committee recently recommended the borrowing of £11,000 for the purchase of new plant for the station at Hareholme. It has been decided, however, that for the present this scheme shall not be proceeded with, but that a cable shall be laid as far as Lookgate, and as much current as possible shall be supplied to Haslingden in that way. The estimated cost of this is about £2,000.

Redruth.—**STREET LIGHTING.**—Owing to restricted lighting the U.D.C. is negotiating with the Urban Electric Supply Co. for a revision of the existing charges for public lighting.

Surbiton.—**E.L. PURCHASE.**—The transfer of the Council's electricity undertaking to Messrs Callender's Cable and Construction Co., Ltd., has been completed. Messrs Callender will pay £51,732, by instalments, as purchase price, and have already paid £4,100, to reimburse the Council's losses, and for other matters, including instalments of purchase money due to date of transfer.

Swinton and Pendlebury.—The Lancashire Electric Power Co. has notified the U.D.C. that the price of current would be advanced as from January 1st, in accordance with the advance in the cost of coal, as provided for in the agreement.

U.S.A.—**HALF-WATT LAMPS.**—According to the *Electrical World*, all the arc lamps in the city of New York are to be replaced by large gas-filled tungsten lamps, under the terms of the contracts entered into for 1916 with the different lighting companies supplying the city. The new gas-filled lamps will range from 100 C.P. to 400 watts in size, and the ordinary type tungsten lamps from 40 to 100 watts. During 1914 the city decided to discontinue the use of the flaming arc lamp; beginning with 1915 there were in service 13,211 arc lamps, many of which were replaced during the year by gas-filled tungsten lamps, while this year the remainder are to be replaced, resulting in a saving in the larger sizes of about \$10 a lamp over the arc lamps replaced. Our contemporary adds that besides saving in money, it was found after a careful investigation that the gas-filled unit afforded a more uniform distribution of light without glare or flicker, and had a much greater penetrating power in stormy or foggy weather.

The Inland Steel Co., Ind., is reported to have placed a million dollar contract with the Westinghouse Co. for steel mill electric plant, including two 5,000-kw. turbine sets, two fly-wheel motor-generator sets, two 8,000-h.p. motors and a 15,000-h.p. motor.

The Niagara, Lockport and Ontario Power Co. is contracting to deliver 40,000 h.p. to Niagara Falls manufacturing plants. This power will be supplied by the Ontario Power Co. from the Canadian side and used mostly for electro-chemical purposes.

West Ham.—**PROPOSED LOANS, &c.**—In connection with the recent breakdown on the 5,000 kw. machine at the generating station, the engineer has made arrangements with the makers for the reconstruction of the electrical end of the machine on a more modern plan. The Committee recommends approval to the general principle of linking up with Poplar within the limits available at the present time. The engineer in the course of a report to his Committee, says he proposes that application should be made to the L.G.B. for sanction to borrow £3,000 for mains and £5,000 for sub-stations, transformers and switchgear, in order to cover amounts overpaid, and to provide a balance to meet applications which may arise; £11,000 for increasing the capacity of mains in the Silvertown district required on account of the increasing demand by the Port of London Authority; £4,500 in connection with the linking-up scheme with Poplar; £3,275 in connection with the generating station, and £1,000 for meters. The Committee recommends the adoption of the report. The L.G.B. has given its consent to the borrowing of £2,000, being the balance unexercised on a sanction of £17,500 for services, &c.

TRAMWAY and RAILWAY NOTES.

Australia.—The N.S.W. Public Works Department has in contemplation four additional tramways in the Sydney area, at a cost of £164,000. The lines are from Bondi Road to Bronte, along Cooks River Road to connect with the Gardeners Road line, and from Burns Road to Ryde.

Bispham.—The Blackpool Corporation is in negotiation with the Blackpool and Fleetwood Tramroad Co., as an interested party, with regard to a scheme for the building of a sea wall north of Blackpool, to arrest the erosion of the cliffs. The Bispham U.D.C. feels itself too small a body to undertake such a large expenditure—about £25,000—and has approached the Corporation with a view to an extension of its boundaries, so as to absorb Bispham.

Birmingham.—**TRAILER CARS.**—The Tramway Committee has instructed Mr. Baker, the general manager, to inquire into the use of trailer cars on the London tramways with a view to their possible introduction in Birmingham, where the shortage of drivers is causing some concern.

Eccles.—**TRAMWAY SURPLUS.**—There was a surplus of £2,220 on the tramway account for the year ended March 31st last: £572 of this has been appropriated for street improvements account, and the balance of £1,647 has been carried to the reserve fund.

Glasgow.—In order to comply with the terms of the restricted lighting order, the Tramways Committee has had the windows of the cars painted halfway down. In addition, nearly 20,000 lamps have been dipped, and measures are to be taken to dim the lamps on the forepart of the cars so far as is consistent with the public safety, and to dull the illuminated signs.

Halifax.—The B. of T. has extended the period for the completion of certain tramways authorised by the Halifax Corporation Act, 1911, for one year from August 18th, 1916.

Hull.—**TRAMWAY SURPLUS.**—The income of the Corporation tramways up to March 31st next is estimated at £162,890, and the credit balance, after meeting all charges, at £13,762, against £19,112 in the previous year. It has been decided to grant £10,000 to the relief of the rates, as in previous years. During the year 14 fares have been maintained and some five million free rides given to soldiers, &c. The department has a reserve fund of £143,000.

Lanes. & Yorks. Railway Electrification.—Sir George Armytage, chairman of the board, stated at the annual meeting of the shareholders on February 16th that the electrification of the Manchester and Bury line was now almost complete, and that the electric trains would be gradually brought into use at an early date. The statement of receipts and expenditure on capital account showed that on electric power stations, &c., the company had expended up to December 31st, 1914, the sum of £392,804, and during 1915 £112,871 was expended, making a total of £505,676 on this head. Estimated further expenditure on capital account included £17,500 during the current year on the electrification of the Manchester and Bury line, and £6,500 subsequently; and £28,400 on electric power stations, &c., during 1916, and £5,500 subsequently. Under the heading of rolling stock, detailed figures were given respecting the trains worked by electric power, from which it appears that the number of cars had increased during the past year from 174 to 210, and the carrying capacity from 13,616 seats to 16,552 seats.

London.—**POPLAR.**—**ELECTRIC WAGON.**—The Electricity Committee has recommended the B.C. to purchase, for joint use with the Works Department, a 4-ton Edison electric wagon, and a 4-ton Foden steam wagon. The total cost is estimated by the Committee at £2,000.

London and North-Western Railway Electrification.—The engineer's report on the progress of the work up to February 10th states that the bridges and tunnels for the junctions between the new electric lines and existing lines to Euston and Broad Street are in progress, and half the length of the iron-lined tunnels under Primrose Hill has been completed. The electric power station and repair shed at Stonebridge Park and six electric sub-stations are complete, and part of the plant has been installed, and the equipment of the new lines for electric traction between Willesden and Watford is in a forward state.

The electrical equipment of the North London, Hampstead Junction, and North-South Western Junction lines, which form the through route between Broad Street and Kew Bridge and Richmond, is being proceeded with, and the buildings for the sub-stations on these lines are complete.

Manchester.—**FEMALE LABOUR.**—About 250 women are now employed on the Corporation cars, and others are being appointed to fill the places of men called to the army under the group system.

Monmouthshire.—The Board of Trade has extended the period of the Western Valleys (Monmouthshire) Railless Electric Traction Act, 1913, for one year.

U.S.A.—**ELECTRIC TRUCK PARADE.**—An unusual demonstration occurred in December last, in Chicago's "loop" district, when 89 electric trucks, loaded with tea and coffee, paraded in the streets to mark the inauguration of exclusive electric truck delivery service by Messrs. Reid, Murdoch & Co., wholesale grocers. The procession was accompanied by mounted police, and a band enlivened the proceedings—in American fashion. The goods were consigned to 1,920 customers in 875 cities in the States, and the result was "some" advertisement. But we wonder what would happen were a London firm to suggest a similar demonstration in the City.

60,000-KW. TURBINES.—The Interborough Rapid Transit Co., of New York, is considering bids for two 60,000-kw. steam turbo-alternators, which, according to the *Electrical World*, will each be made up of three separate electric generators driven by one high-pressure and two low-pressure turbines, the latter being connected in multiple. Apparently it has not been decided yet whether to install 60,000-kw. units or the equivalent in 30,000-kw. units.

Walthamstow.—The Tramways Committee recommends a revision of the fares and fare stages, including an increase of 50 per cent. on the prices of workmen's tickets. Having been advised by the contractors for the supply of tickets that the restriction of the importation of wood pulp would result in them being able to supply only 50 per cent. of the usual requirements of tickets, the District Council has been recommended to communicate with the Board of Trade, pointing out that the proposed allowance would place the undertaking in considerable difficulty, and asking the Board to withdraw the restriction as far as tramway undertakings are concerned.

West Ham.—**HALF-PENNY FARES, &c.**—The tramways manager recommends the pulling up of the Beckton Road tramway, and the relaying of as many rails as are required in the doubling of the Connaught Road terminus track. The manager estimates the cost of this doubling at £970, the cost of pulling up the rails in Beckton Road and making good the roadway at £350, and the value of the rails, fish plates, &c., recoverable at over £2,000. The manager has submitted an exhaustive report on fares and stages, in which he recommends, *inter alia*, the abolition of the halfpenny fare. He estimates the cost of new track work requiring to be put in hand as soon as possible at about £100,000, and is of opinion that some action should be taken to increase revenue. Whereas the actual cost of carriage per passenger works out at 67d., excluding capital charges, 47 per cent. of the total number carried only pay one halfpenny. The halfpenny fare at West Ham, with the exception of one year, has never covered actual running costs. A scale of fares should be made which gives the journey desired at not less than cost price, and should be periodically revised in accordance with the requirements of the financial side of the undertaking. The Committee recommends the Corporation to put into operation the following fares on all cars running in the borough as and from the beginning of the next financial year:—(1) A universal 1d. fare for a continuous journey on any one car; (2) a 1½d. workmen's return fare for a continuous journey on any one car; (3) existing through fares where necessary to be adjusted to comply with the above scheme; (4) children's stages to remain in force as at present.

CONTRACTS OPEN and CLOSED.

OPEN.

Aberdare.—March 8th. Electrical goods, for the Powell-Duffryn Steam Coal Co. Stores Manager, Aberdare offices. March 11th. U.D.C. Electrical stores for 12 months. See "Official Notices" February 18th.

Australia.—**SYDNEY.**—May 1st. Two 300-KW. turbo-alternators, condensers, switchboard, &c., for the pumping station at Ryde, for the Metropolitan Board of Water Supply and Sewerage at Sydney.

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-KW. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney.

MELBOURNE.—April 19th. Victorian Railways. One 1,000-amp.-hour storage battery, plant for impregnating electrical apparatus with insulating varnishes, &c.

Belfast.—March 15th. Tramways and Electricity Committee. Stores, including a number of electrical items. See "Official Notices" to-day.

Birkenhead.—March 6th. Corporation. Cable and two rotary converters with switchgear. See "Official Notices" February 1st.

Bolton.—March 2nd. Electricity Committee. Stores, including some electrical items. See "Official Notices" Feb. 11th. March 6th. Tramways Committee. Stores, including lamps, carbons, &c. See "Official Notices" to-day.

Dewsbury.—Electricity Department. Two second-hand 250-KW. generator panels, oil separator, piping, cables, &c. See "Official Notices" February 11th.

Dover.—March 9th. Electrical sundries and cables, for the Harbour Board. (Schedules 2s. 6d. each.) Mr. Martyn Mowl, Registrar, Castle Street.

Dublin.—March 1st. Battery materials for carriage lighting, for the G.N. Railway Co. (Ireland). See "Official Notices" February 18th.

Dundalk.—March 21st. U.D.C. Engine-room stores, cables, lamps, &c., for the Electricity Department. See "Official Notices" to-day.

Edmonton.—March 8th. Electric lamps for six months, for the B. of G. Mr. F. Shelton, Clerk, Lower Tottenham.

Heston and Isleworth.—March 11th. U.D.C. Electrical supplies, including cables, meters, &c. See "Official Notices" to-day.

Heywood.—March 15th. Electricity Committee. Stores, including some electrical items, for 12 months. See "Official Notices" to-day.

Keighley.—30-H.P. electric motor installation for pump driving, for the Fleece Mills Co., Ltd. See "Official Notices" February 18th.

Manchester.—March 7th. G.C. Railway Co. Stores, including electrical items. Stores Superintendent, Gorton.

New Zealand.—DUNEDIN.—May 17th. City Council. (1) Tramcar bodies; (2) electrical equipment. Plans, &c., from the Town Clerk, Dunedin.

Plymouth.—March 2nd. Corporation. Converter with starter. See "Official Notices" February 18th.

Pontypridd.—March 13th. U.D.C. Twelve months' supply of electrical stores for the Electric Light and Tramways Department. See "Official Notices" February 18th.

Spain.—Municipal authorities of Esguevilla (Province of Valladolid). Tenders for the concession for the electric lighting of the town during a period of four years.

Swansea.—March 6th. Education Committee. Electric lighting installation at Brynmill and Cwmbwria Council Schools. See "Official Notices" February 18th.

West Ham.—March 22nd. B. of G. Three months' supply of electric fittings. Clerk, Union Road, Leytonstone.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Government Contracts.—List of new contracts for January, 1916:—

Electric cable and wire.—British Insulated and Helsby Cables, Ltd.; Frankenburg & Sons, Ltd.; Hopper's Telegraph and India-Rubber Works, Ltd.; Johnson, Matthay & Co., Ltd.; John-on & Phillips, Ltd.; Liverpool Electric Cable Co.; St. Helens Cable & Rubber Co., Ltd.; Siemens Bros. & Co., Ltd.
Generating sets.—Asster Engineering Co., Ltd.; Austin Motor Co., (1914), Ltd.
Elect. lamps.—Balfour, Baring, Ltd.
Switches.—Berry & Hayward, Ltd.
Terminals and electrical instruments.—British L. M. Ericsson Manufacturing Co.; John-on & Phillips, Ltd.
Works & erect.—Electric Light at Crowlans Camp, Barrow-in-Furness, E. M. Evans & Sons, Ltd.; electric light installation at Haynes Park, Girdlestone & Co.; electric lighting at Bridge of Allan, Mackenzie & Moncur; electric lighting at Kenrose, Mackenzie & Moncur; electric lighting at Dunmillen, Grandy, Ross & Co., Ltd.; installation of elect. lighting, bells, &c., at War Hospital, Bath, N. G. Middleton; power house, &c., at Lilbourne, Girdlestone & Co.

H.M. OFFICE OF WORKS.

Motor-generator, &c., at Research Building, Teddington.—Vickers, Ltd.
Supply of electric cable and wire during 1916.—General Electric Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.

POST OFFICE.

Telephone apparatus.—Automatic Telephone Manufacturing Co., Ltd.; Western Electric Co., Ltd.
Insulator brackets.—Bullers, Ltd.
Telephone cable.—Union Cable Co.
Repeating coils.—Western Electric Co.
Flexible cords.—British Insulated and Helsby Cables, Ltd.
Earthenware troughing.—Doulton & Co., Ltd.
Lead tubs.—G. J. Chatelton, Ltd.
Bronze wire.—T. Bolton & Sons, Ltd.; F. Smith & Co. (incorporated in the London Electric Wire Co. and Smith's, Ltd.)

London.—POPULAR.—Tenders received by the Electricity Committee for switchgear for linking up with Hackney:—

British Westinghouse Co.	(recommended)	£1,498
Siemens Bros.		1,504
Johnson & Wright, Ltd.		1,621
Ferranti, Ltd.		1,760

Midland Railway Co.—Contract for Osram drawn-wire lamps for 12 months, placed with the General Electric Co., Ltd.

Reading.—Borough Education Committee. Wiring work, &c., for the X-ray apparatus at the School Clinic: Reading Electric Supply Co., Ltd.

Southend-on-Sea.—T.C. Two years' supply of coal for the electricity works, with an option of about 10,000 to 11,000 tons a year: Foster & Co.

Walthamstow.—District Council. Coal for the electricity works for 12 months, 50 tons per week: Myers, Rose & Co.

FORTHCOMING EVENTS.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, February 25th. At 7.30 p.m. At the B.I.B.C. Hall, Newcastle-on-Tyne. General meeting.

Association of Mining and Electrical Engineers (Notts and Derbyshire Branch).—Saturday, February 26th. At 3.30 p.m. At University College. Paper on "Slate Traversers," by Mr. C. Jones.

Manchester Association of Engineers.—Saturday, February 26th. At the Grand Hotel, Aytoun Street. Paper on "Cast Steel as a Material of Construction," by Mr. E. F. Lange.

Battersea Polytechnic, Battersea, S.W.—Saturday, February 26th. At 7 p.m. Annual conversation and inspection of students' work.

Junior Institution of Engineers.—Saturday, February 26th. At 9 p.m. At the Holborn Restaurant. Concert in aid of the British Red Cross Society. Tuesday, February 28th. Lecture on "Chemistry and Engineering," by Prof. H. E. Armstrong, F.R.S.

Post Office Telephone and Telegraph Society of London.—Monday, February 28th. At 6.30 p.m. At the I.E.E., Victoria Embankment, W.C. Paper on "Loading of Telephone Circuits," by Mr. A. B. Hart.

Association of Supervising Electricians.—Tuesday, February 29th. At 7.15 p.m. At St. Bride's Institute, Bride Lane, E.C. Paper on "Illuminating Engineering," by Mr. L. Guster.

Institution of Electrical Engineers.—Wednesday, March 1st. At 5 p.m. At the Institution. Special general meeting of corporate members.

Institution of Electrical Engineers (Students' Section).—Wednesday, March 1st. At 7.45 p.m. At Victoria Embankment, W.C. Discussion on "Suggested Applications of Science to Warfare," opened by Mr. R. E. Dickinson.

Chemical Society.—Thursday, March 2nd. At 8 p.m. At Burlington House, Piccadilly, W. Ordinary scientific meeting.

Greenock Electrical Society.—Friday, March 3rd. At 7.45 p.m. At the Temperance Institute, 15, West Stewart Street. Paper on "The Life of Sir Charles Wheatstone," by Mr. A. K. Macdonald.

Royal Institution of Great Britain.—Friday, March 3rd. At 5.30 p.m. At Albemarle Street, Piccadilly, W. Lecture on "Corona and other Forms of Electric Discharge," by Prof. Silvanus P. Thompson, F.R.S.

NOTES.

The Accurate Use of Technical Terms.—An engineering correspondent writes as follows:—It is with regret that one frequently sees the meaning of words blurred owing to continued wrong usage. Often one wishes for an English Academy to watch over our language in order to prune away such excrecences as they appear. The journalistic use of the word "decimate" provides a case in point. Its real meaning is to kill a tenth part, but now it is used as equivalent to annihilate. In engineering we often find the word "bearings" applied to that part of the shaft which runs in a bearing; surely a confusing term, when the bearing is obviously the fixed part which bears or supports the shaft. The part of the shaft in the bearing should always be called the journal. The word "rate" now shows signs of going wrong, being used with two quite contradictory meanings. In a recent REVIEW article on Electric Lifts, the author writes as follows:—"The resistance should be amply rated. . . so that they cannot be damaged if run for long periods with resistance in circuit." On the other hand, in connection with Prof. Field's recent I.E.E. paper, it was pointed out in the discussion that a turbo-generator which the Americans would rate at 20,000 kW., in England would be rated at 14,000 kW. In the first case the words "ample rating" mean of simple proportions, while in the second case the word rate has the opposite meaning. A most entertaining, not to say expensive, law-suit could thus be built upon the contrary uses of the word "rate," where the consultant had specified that the machine was to be amply rated, and where the maker had supplied plant of meagre proportions. One lot of experts would declare that, in engineering circles, ample rating means ample proportions, while the other side would produce equally eminent experts and also dictionary makers to prove that the words certainly mean that the materials had to be worked to their utmost, and weight kept down.

What is the proper meaning of the word "rate"? The Standard Dictionary gives as the meaning of the word "To set an estimate upon, especially with reference to other similar things."

Hence a low-rated machine is one from which one does not expect very much, while a highly-rated machine is one from which one expects a great deal. The writer, therefore, submits that the meaning in Prof. Field's discussion is the correct one, and that an amply-rated machine is one having small proportions and heavy stresses.

How are we to express the intention of the author of the Electric Lift article so as to bear elucidation by the lawyers? Some makers advertise their motors as being liberally rated, and others state that theirs are conservatively rated. Doubtless this is the unique case where the words conservative and liberal have the same meaning, but it does not seem likely that either of them in this connection would satisfy a judge.

Probably the best way would be to state that the machine must have proportions ample for the work specified, and that the stresses must be low. One might say that the rating must be low, but while correct it will be better to avoid this expression until the word is no longer used wrongly.

Our American friends have a way of stating that the construction of their plant is "rugged." To us this seems to mean that the workmanship is rough and unfinished, but a reference to the Standard Dictionary shows that in the U.S.A. the word "rugged" is used with the meaning "Possessing vigorous health, robust, sturdy." That is picturesque, like many Americanisms, but the Englishman will do well to avoid it. He might find that makers in this country interpret it as having the other meaning, namely, "having a surface full of abrupt inequalities or projections."

Institution and Lecture Notes.—Institution of Electrical Engineers.—The Kelvin lecture which was delivered by Dr. C. Chree, F.R.S., on the 17th inst., was devoted to "Terrestrial Magnetism," a subject which had been dealt with by Lord Kelvin in connection with his important changes in the design of the mariner's compass, and with the possible relation between terrestrial magnetic storms and solar influence. Lord Kelvin in 1883 showed that if the sun's magnetisation were 120 times as intense as that of the earth, its complete reversal, if that were possible, would only produce a disturbance of 1' in declination. He next referred to the subject in 1892, when he devoted fully half of his Presidential address to the Royal Society to terrestrial magnetism; he then stated that in order to produce appreciable disturbances the sun must be a magnet of 12,000 times the intensity of the terrestrial magnet, but held that even if the magnetic force of the sun were perceptible here, it was vastly less in amount than the abruptly varying force which was required to account for the magnetic storms which were apparently associated with the occurrence of spots on the sun. Further, he gave reasons which, to his mind, were absolutely conclusive against the supposition that terrestrial magnetic storms were due to the magnetic action of the sun, the expenditure of energy at the sun necessary to produce the observed results being inconceivably enormous.

However, Dr. Chree points out that Lord Kelvin's conclusion has little bearing on the theories of solar action mainly current to-day, which attribute the magnetic storms to the presence in the earth's atmosphere of something bearing an electric charge, originally projected from the sun.

The lecturer then discusses in turn the secular change, the solar diurnal variation, and the phenomena of magnetic disturbances, of which subjects, as Superintendent of the Kew Observatory, he is one of the foremost investigators.

The lecture forms a very important contribution to the literature of this subject, which may seem abstruse at the moment, but, like the phenomena of static electricity in connection with wireless telegraphy, high-pressure transmission, &c., may become of immense importance to electrical engineers in the not distant future.

Physical Society of London.—At the annual general meeting, held on February 11th, the reports of the Council and of the treasurer were adopted. The following officers were elected for the ensuing year:—President, Prof. C. V. Boys, F.R.S.; Vice-Presidents, Messrs. W. R. Cooper and F. E. Smith, Dr. S. W. J. Smith and Dr. W. E. Sumpster, D.Sc.; Secretaries, Dr. W. Eccles and Dr. R. S. Willows; Foreign Secretary, Dr. R. T. Glaszbrook; Treasurer, W. Daddell, F.R.S.

Papers were read "On a General Bridge Method for Comparing the Mutual Inductance between Two Coils with the Self-Inductance of One of Them," by Prof. C. H. Lys, F.R.S., and on "An Enclosed Cadmium-Vapour Arc Lamp," by Dr. H. J. S. Sand. The lamp is similar to the mercury lamp, and is constructed of quartz glass. To start the lamp, the metal is melted by means of a Bunsen burner, and the arc is struck by tilting. Before introduction into the lamp the metal is freed from oxide and dissolved gases by a special process of filtration while at the pump. It is prevented from adhering to the glass, which might lead to fracture, by the presence of a small amount of a loose powder in the lamp. The lamp gives a powerful light, and, once started, will continue burning indefinitely.

Two slides were shown by Dr. S. Russ, showing the ultra-violet spectrum of the Simpson arc and that of pure tungsten. It was evident that the spectrum of the former was almost wholly due to tungsten.

Dublin Electricity Supply.—As we go to press we have received the following letter:—"We notice in your issue of February 18th a summary of Mr. P. W. d'Alton's report on the Dublin electricity undertaking, and a reference to the steam turbine supplied by us. In view of the recommendation put forward in the report that the turbine should be reconstructed, and to remove any misapprehension, we beg to put on record that the turbine referred to was supplied by us nine years ago. As you are well aware, considerable improvements have been made in turbine design since this machine was supplied, resulting in increased economy.

For RICHARDSONS, WESTGARTH & CO., LTD.
M. G. S. SWALLOW.

Hartlepool, February 23rd, 1916.

The War and Electrical Goods.—On Wednesday, in the Bow County Court, before his Honour Judge Graham, K.C., Mr. G. J. Wilson, of Liverpool, dealer in electrical appliances, sought to enforce the payment of a judgment debt of £16 10s. 9d, from J. Goldberg, trading as the Anglo-Russian Electrical Supply Co., of 99, Woodstock Street, Canning Town. Mr. Daybell, who appeared for the plaintiff, said the case was bordering on fraud. The defendant extensively advertised electrical goods, and the plaintiff sent money along for them, but never got the things, nor had he had his money back. The defendant was cross-examined, and admitted that prior to the war, and up to about a twelvemonth ago, he did advertise very largely, but now his business had been completely ruined owing to the fact that so little electric light was used. The darkening of London had ruined him, as it had a good many others. He agreed that in April, 1915, he advertised 50,000 Exellox carbons for sale at £1 a 100, but, as a fact, he had to dispose of them at 2s. 6d., and even as low as 1s. 6d. Before the war he used to get quite a number of these lines, but now he could do nothing. He thought he could pay 5s. a month. Judge Graham said, "It is better than nothing, and that is my order for 12 months, with 10 days' imprisonment in default. In reply to Mr. Daybell, he allowed his client's costs from Liverpool.

A Turbo-Generator Steam Consumption Test.—The following corrections were received from the author of the article on page 240-241 after those pages had gone to press:—

Table I.—185 lb. pressure—allowance, '125 per cent.

Volunteer Notes.—ENGINEERING INSTITUTIONS' V.E.C.
—Orders for week commencing February 28th, 1916.—By Lieut. Col. C. B. Clay, V.D., Commanding.

Saturday, February 26th.—Uniform Parade, 2.45 p.m.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Monday, February 28th.—Sections 1 and 2, Technical; Sections 3 and 4, Lashings and Trestle Bridging, Signalling Class and Recruits.

Tuesday, February 29th.—School of Arms, 6 to 7 p.m.

Thursday, March 2nd.—Shooting for Sections 3 and 4.

Friday, March 3rd.—Sections 3 and 4, Technical; Sections 1 and 2, Lashings and Trestle Bridging; Signalling Class and Recruits.

Saturday, March 4th.—Adjutant's Instruction Class at 2.30 p.m.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Sub-Commandant), Thursday, February 24th, 1916:—

Week-end Parades.—Saturday.—The Battalion will parade at Wembley Park at 3.15 p.m. for drill under Company Officers. "Derby" recruits are invited to attend.

Sunday.—The Battalion will parade at Liverpool Street Station (low-level entrance, G.E.R.) at 9.30 a.m., and proceed by train for Entrenching duties. Members will carry their own lunch. The Battalion will return to town about 6 p.m.

Musketry.—Action Range will not be open on Saturday, 26th inst. A Match will be shot at Bisleys on Saturday, Sergeants & Privates. Men to Parade in uniform, at 12.45 p.m., Waterloo Station, No. 6 Platform.

A. G. JOINER, Major and Adjutant, O.B.C.

ELECTRIC SMELTING OF IRON ORES IN SCANDINAVIA.

Introduction.—We are indebted to the enterprise of the Canadian Department of Mines for a most useful report on the present state of the electric smelting of iron ores in Sweden and Norway (Notodden), which Dr. Alfred Stansfeldt has drawn up as a result of a visit of inspection made in the summer of 1914. The purpose of the investigation was to take particular note of the economics of the operation of the furnaces in use, in view of the possibility of establishing an electric pig-iron industry in Canada.

Types of Furnaces in Operation.—Two main types of furnace are at present in use for smelting iron ores: (1) The Elektrometall furnace; (2) Furnaces of the Helfenstein type. The following tables give a list of the 13 furnaces in operation and the 10 in course of construction in June, 1915:—

I.—ELEKTROMETALL FURNACES.

	In operation.	Building.
Domnarvet	2 of 3,000 H.P. 1 of 6,000 H.P.	—
Sölversfors	—	3 of 3,000 H.P.
Ljusne	—	1 of 3,000 H.P.
Hälsfors	3 of 3,400 H.P.	3 of 3,400 H.P.
Nykroppa	—	2 of 3,400 H.P.
Trolhättan	1 of 3,000 H.P.	1 of 3,000 H.P.

In the far north of Sweden a large iron-works of 25,000 H.P. is to be constructed immediately.

II.—HELFEINSTEIN AND TINFOS FURNACES.

Domnarvet	1 of 5,000 H.P. 1 of 7,000 H.P.
Notodden (Norway)	4 of 1,600 H.P.
Ulefos	1 small furnace.

The Elektrometall Furnace.—The feature of this furnace is that the ore is preheated, and partially reduced in a large shaft before it reaches the smelting chamber, the heating and reduction being materially assisted by the circulation of the furnace gases, which

is characteristic of this furnace. In the most recent examples the crucible is circular, and is lined with fire-brick, and it is provided with only one tapping-hole for both slag and metal, which are separated by a dam as they flow. The arch of the crucible, constructed of fireclay bricks, is cooled below by the cool gases from the top of the furnace, and also by cold air. The stack of the furnace is constructed in a steel shell, and is supported on steel beams independently of the crucible. The shaft is reduced to a neck where it enters the crucible, but the tendency is to increase the width of this to facilitate the passage of gases. The electrodes, which are circular, about 2 ft. in diameter, and 4 or 5 ft. long, enter the furnace through the arch just outside, and concentrically with the neck. The larger furnaces have six electrodes, which, supported by rollers, lie between two inclined guides. At the bottom of the guides is a water-cooled collar, built into the furnace arch, but supported from above, and above this collar is a water-cooled contact ring made up of a number of metal blocks forming a flexible collar round the electrode. These blocks are connected by cable to the bus-bars. A clamping ring above the contact ring serves to feed the electrodes, which do not, as a rule, need moving more than once in two or three days.

The furnaces with six electrodes are supplied from three transformers with three-phase current, each transformer being connected to diametrically opposite electrodes, so that the current tends to pass between these rather than between adjacent electrodes. The regulation of the current is effected by varying the supply voltage on the primary side, and not by moving the electrodes.

To circulate the furnace gases, the gas withdrawn from the top of the furnace is filtered, washed and dried, and returned—either through a Roots blower or else simply by means of the rotary washing fan—to the furnace through six tuyeres, entering beneath the furnace arch and between adjacent electrodes. Increasing the circulation raises the temperature in the shaft facilitates the reduction of the ore, raises the percentage of CO_2 in the escaping gases and increases the economy of electric power and of fuel, but it also increases the consumption of the electrodes. An important economy in operation will be effected when the escaping gases are utilised for heating open-hearth furnaces.

The Swedish iron industry consists principally in smelting the pure native ores with charcoal in blast furnaces. The industry is profitable, because the pig-iron produced is of high quality and commands a high price. Now the electric furnace can compete very favourably with these blast furnaces, first, because they are small; secondly, because the electric furnaces yield better metal; and finally, because only about one-third of the charcoal is consumed in the latter for the same yield of iron. The Elektrometall furnaces are small, too; the 4,000-H.P. unit at Domnarveta yields only some 30 tons daily, yet the cheap Swedish water power renders the cost of making iron less than in the charcoal blast furnaces. Attempts to use coke instead of charcoal in the Elektrometall furnace have so far been unsuccessful, although further experiment is being made in this direction by building the furnace shaft wider and lower.

Efficiency of the Elektrometall Furnace.—The Report contains some fully-detailed accounts of the working of the furnaces which were inspected, as regards power and material consumption, heat distribution, and output. We can only summarise them very briefly here.

The power is supplied at some 10,000 volts and transformed to 80 or 90 volts at the furnace terminals. The energy consumed for auxiliary purposes—motors and lighting—is some 2½ per cent. of the whole supply. Neglecting transformer losses, the furnaces utilise during operation about 90 per cent. of the power supplied, and some 82 or 83 per cent. of the gross amount paid for, allowing for holidays and stoppages for repairs. This figure would be considerably higher—say, 90 per cent.—if three or four furnaces were worked together.

The amount of electrical energy to be paid for (on the above 82 per cent. basis) to produce 1 ton of pig-iron works out at 0.41 H.P.-year utilising 60 per cent. ores and 0.47 H.P.-year for only 50 per cent. ores. These figures are for basic Bessemer or acid open-hearth iron. To make grey foundry pig about one-half of a H.P.-year is at present required.

The consumption of charcoal may be taken as 340 kg. per ton of white pig, and 370 kg. per ton of grey pig-iron.

The consumption of electrodes varies considerably, but it has been reduced as low as 3 kg. per ton of iron; an average figure is 5 or 6 kg.

The circulation of gases in the Elektrometall furnace economises the consumption of charcoal, but it increases that of electrodes.

(To be continued.)

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Mr. A. R. FOX, who has resigned his position as shift engineer at the Macclesfield electricity works, will take up the post of resident engineer-in-charge at Chippenham electricity works a month hence.

On February 23rd, at Sheffield, Mr. F. P. SEAGER, of the engineering staff at the Manchester Corporation electricity works, was married to Miss Edith Maude Warburton, of Sheffield.

The Blackburn Electricity Committee has decided to increase the salary of Mr. WHEELWRIGHT, the electrical engineer, by £100 per year, bringing it up to the level of salaries paid to other officials of similar standing.

General.—Mr. W. HOOPER, formerly on the staff of the Lynton (Devon) electricity works, was on H.M.S. *Archusa* when she was mined, and was saved.

The *London Gazette* contains the following announcements:—**Territorial Force:** The undermentioned to be temporary captains: Second-Lieutenants (temporary Lieutenants) T. F. MIDDLETON-CASE, G. R. MADGE, and M. G. BLAND. The following Second-Lieutenants to be temporary Lieutenants: H. G. G. CLARKE, CECIL H. S. EVANS, W. H. MATHER, G. E. OWLES, E. O. LEVETT, and T. H. GOTCH. Lance-Corporal A. S. GILL to be Second-Lieutenant (on probation).

Mr. J. G. BALSILLIE has vacated the post of radio-telegraph engineer to the Australian Commonwealth Government, to which he was originally appointed in 1911, for three years, for the purpose of establishing and developing a wireless system for Australia. His term expired last year, but in consideration of the vital importance of wireless telegraphy during the war, it was extended a further year. The system adopted by the Federal Government is the invention of Mr. Balsillie, and the originality of its distinguishing features has been recognised by its former disputants, the Marconi Co. Mr. Balsillie, however, placed the system absolutely at the disposal of the Federal Government, and has so far received no monetary consideration on its account. Mr. Balsillie will concentrate his attention on the artificial production of rain.—*Australian Mining Standard*

Roll of Honour.—Lieut. HARRY MARSH, who has been killed in action in France, was with the Lancashire Electric Power Co., Manchester, before the war.

Private REGINALD LIGHTFOOT, of Crewe University and Public Schools Battalion, who has been killed in action, was in the electrical department at Crewe Railway Works.

Sergeant E. J. BERRY, formerly employed by the Chloride Electrical Storage, Ltd., Clifton Junction, is in hospital suffering from shell shock.

Rifleman HARRY SCATTERGOOD, formerly in the electricity department of the Co-operative Wholesale Society, Trafford Park, has died from wounds received in action.

Obituary.—MR. A. L. SABINE.—We learn with deep regret of the death of Mr. Alfred Louis Sabine, which occurred on Sunday last, at Herne Bay, at the age of 75 years. The deceased gentleman was for 50 years in the service of Messrs. Siemens Bros. & Co., Ltd., for 30 years (from 1880 to 1910) holding the position of secretary, from which he retired six years ago. Mr. A. L. Sabine was a brother of the late Mr. Robert Sabine, the eminent civil and electrical engineer. In our youthful days we were personally in constant touch with him, and we remember him as a man of most gentle and retiring disposition, with whom it was a pleasure to converse.

Will.—Mr. GEO. ANGUS, of Geo. Angus & Co., Ltd., belting manufacturers, left £24,541.

NEW COMPANIES REGISTERED.

Lower Thames Land Development and Power Co., Ltd. (143,053).—This company was registered on February 18th, with a capital of £7 in £1 shares, to acquire and turn to account a certain estate at Barking, Essex, fronting on the River Thames, containing 308 acres. The subscribers (with one share each) are: J. B. Braithwaite, 37, Austin Friars, E.C., stock and share broker; H. B. Renwick, Burnham, Chardfield Heath, S.W., director; F. W. Reynolds, Avon Works, Edward Street, Blackfriars, S.E., director; F. C. M. Brown, 44, Marlborough Hill, N.W., secretary; G. Tweedie, 42, Palmerston Crescent, Palmer's Green, N., accountant; G. Scott, 30, Gloucester Terrace, Hyde Park, W., engineer; T. W. Cole, 44, Rose Hill Road, Wandsworth, N.W., secretary. Private company. The number of directors is not to be less than three or more than seven; the first are J. B. Braithwaite, H. B. Renwick, and F. W. Reynolds. Qualification, one share. Remuneration, £500 per annum, divisible. Registered office: Moorgate Court, Moorgate Place, E.C.

Coates and Co. (Sheffield), Ltd. (143,006).—This company was registered on February 14th with a capital of £3,000 in £1 shares (500 paid), to take over the business of an electric engineer and contractor carried on by J. Coates, at 315, Glossop Road, Sheffield, as Coates & Co. The subscribers (with one share each) are: J. Coates, 315, Glossop Road, Sheffield, electrical engineer; Mrs. M. A. Coates, 5, Peter Terrace, Sheffield, Private company. The number of directors is not to be more than five; J. Coates is first permanent director. Qualification, £100. Solicitor: C. Crowther, 23, Abingdon Street, Westminster. Registered by Jordan & Sons, Ltd., 116-117, Chancery Lane, W.C.

Scientific Inventors' Syndicate, Ltd. (143,070).—This company was registered on February 19th, with a capital of £1,000 in £1 shares, to experiment with, manufacture, and develop methods and means of light, heating and ignition, produce and destroy gases, produce neutralising effects by electrical, chemical, or mechanical means, and to use, manufacture, aid in, and turn to account by-products and waste material. The subscribers (with one share each) are: F. Harrison, 12, Barry Road, East Dulwich, S.E., electrical engineer; F. L. Harrison, 12, Barry Road, East Dulwich, S.E., electrical engineer. Private company. The number of directors is not to be less than two or more than five; the first are F. Harrison (permanent chairman) and F. L. Harrison. Qualification, £50. Remuneration is fixed by the company. Registered office: 83, New Street, Kennington, S.E.

Makin and Co., Ltd. (113,007).—This company was registered on February 14th, with a capital of £1,000 in £1 shares, to carry on the business of electrical and mechanical engineers and manufacturers, works and dealers in electricity in all its branches, and to adopt an agreement with Makin & Co., Ltd. (no voluntary liquidation) and P. Toothill, the subscribers (with 10 shares each) are: R. C. Smith, Mill Mount, Tuxford, retired general; R. C. Smith, Junr, 2, Astors Road, Sheffield, electrical engineer. Private company. The number of directors is not to be less than two or more than five; the first four R. C. Smith and R. C. Smith, Junr. Qualification, 10 shares. Registered office: 39, Townhead Street, Sheffield.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Colston Electrical Works, Ltd.—Mortgage on certain premises dated January 25th, 1916, to secure all moneys due or to become due from companies to Capital & Counties Bank, Ltd., Clare Street, Bristol.

Mawdsleys, Ltd.—Capital, £20,000 in £1 shares. Return dated January 30, 1916. 18,937 shares taken up; £6,937 paid; £12,000 considered as paid. Mortgages and charges: £6,300.

Telephone Co. of Egypt, Ltd.—A memorandum of satisfaction to the extent of £700 on February 1st, 1916, of debenture stock covered by trust deed dated July 27th, 1904, and three supplemental deeds of acknowledgment dated 1st Feb. 1914, 1906, March 4th, 1908, and October 27th, 1909, securing £200,000, has been filed.

Oriental Telephone and Electric Co., Ltd.—A memorandum of satisfaction to the extent of £1,150 on February 1st, 1916, of debenture stock covered by trust deed dated June 28th, 1905, and a supplemental deed of acknowledgment dated June 12th, 1907, securing £200,000, has been filed.

Sun Electrical Co., Ltd. (63,261).—Capital, £45,400 in £1 shares (£20,000 pref.). Return dated December 28th, 1915. 17,131 pref. and 5,400 ord. shares taken up; £22,541 paid. Mortgages and charges: £3,050.

Alliance Electrical Stores, Ltd. (111,834).—Capital, £25,000 in 17,500 pref. ord. shares of 10s. each, and 1,250 def. ord. shares of 1s. each. Return dated February 5th, 1916. 31 shares taken up; 10s. per share called up on seven pref. ord. and £3 10s. paid; £24,396 10s. considered as paid on 47,493 pref. ord. and 1,250 def. ord. shares. Mortgages and charges: Nil.

North Wales Power and Traction Co., Ltd. (78,193).—Capital, £270,000 in £5 shares (10,000 pref.). Return dated January 7th, 1916. 38,100 ord. and 9,200 pref. shares taken up; £5 per share called up on 34,100 ord.; £170,475 paid; leaving £25 in arrears; £36,000 considered as paid on 9,200 pref. and 4,000 ord. Mortgages and charges: Debt of £40,000, secured by issue of £80,000 first mortgage debts, 5 per cent.; debt of £7,000, secured by issue of £7,000 "B" debts, 6 per cent.; debt of £100,000, secured by £100,000 second mortgage debts, 7 per cent. Total debt, £147,000. Total debts issued, £187,000.

Westinghouse Cooper-Hewitt Co., Ltd. (89,947).—Capital, £30,000 in £1 shares. Return dated December 17th, 1915. All shares taken up, 9s. 6d. per share called up; £14,250 paid. Mortgages and charges: Nil.

CITY NOTES.

Liverpool Overhead Railway Co.

Mr. H. C. WOODWARD, presiding at the annual meeting on Tuesday, said that they were still under the control of the Government, but the original terms of the arrangement had been modified, inasmuch as the proviso that the compensation payable should be reduced in the same proportion as the aggregate net receipts for the first half of 1914 were less than the aggregate net receipts for the first half of 1913, had been done away with as from January 1st, 1915, and in the place thereof it had been agreed that the company should provide out of their net revenue 25 per cent. of the amount of the war bonus granted in February last to employes who come within the Railway Conciliation Scheme. The bonus to the other employes, and the subsequent increase in the bonus generally, are allowed by the Government to be included as working expenses. The number of passengers carried created a new record. It was attributable to the abnormal conditions prevailing in the Port of Liverpool, whose docks had never at any time been so fully occupied. The receipts did not exactly represent the traffic carried; so many more passengers had added to their takings, but the surplus was not shown in the accounts, the difference having been handed over to the Government to assist in making up the deficiencies of some of the other railway companies. They had placed £4,000 to renewal fund and added £400 to contingent fund. Owing to the shortage of labour and the difficulty of obtaining adequate supplies of materials certain work in connection with maintenance had had to be postponed, but this would be done immediately opportunity again offered. The Government had agreed that companies so affected would be recompensed in respect of such deferred work. The heavy traffic of the past year had considerably taxed the accommodation of their rolling stock, particularly at certain times of the day, and in the hours of heaviest traffic a three-minutes' service was in operation, and some inconvenience had been inevitable. The Great Central Railway Co. had acquired the land for the Seaford and Sefton railway. When this new railway was connected with theirs at Seaford the interchange of traffic should prove beneficial, and, provided that Liverpool docks and shipping continued to prosper, he hoped that the results put before the shareholders this year might at least be fully maintained in the future.

Newcastle and District Electric Lighting Co., Ltd.

The gross profit for 1915 was £34,430, plus £14,617 brought forward. Interest on debentures and loans was £18,474, leaving £20,583, out of which £2,200 is put to second mortgage debenture redemption fund, £500 to debenture issue expenses, and £27,883 is carried forward. Though the net profit shows an increase, no dividend is expedient, owing to abnormal conditions. Owing to increased costs, the charge to consumers was raised as from the June quarter. Increased power demand has more than compensated for loss due to restricted lighting. A further £2,000 of the 6 per cent. debentures has been redeemed. Capital expenditure during the year was £48,818. Annual meeting: To-day.

London Electric Supply Corporation, Ltd.

The profit for 1915 was £77,688, against £93,234 for 1914. Including £8,824 brought forward, and allowing for debenture interest and debenture sinking fund, £50,992 remains, out of which 6 per cent. is paid on the preference shares, 3 per cent. on the ordinary, £5,000 is put to contingencies account, and £9,050 is carried forward. Units sold 50,757,584, as against 46,343,065; total costs per unit sold, 6d., as against 5d., (increased coal and wages). Power supplied for traction, tramway, and industrial purposes increased by 11 per cent. Average receipt per unit sold (lighting and power) 9d., against 9d., in 1914. The expenses of generation increased by nearly 50 per cent. owing to the war. Although *prima facie* the accounts show for 1914 an excess profit over the two previous years, no provision is made for Excess Profits Duty. The solicitor advises that "an electricity supply undertaking with a tenure expiring in 1931 comes, if need be, under the provision in Section 42 of the Finance Act referring to businesses which may apply for an increase of the statutory percentage in special considerations; and that when all proper adjustments are made, it will be clear that the Corporation is not liable to the payment of such Excess Profits Duty." Annual meeting: Yesterday.

Yorkshire Electric Power Co.

Mr. A. LURTON, at the annual meeting on February 15th, said that the capital expenditure (£3,550 less than in 1914) had been limited to extensions which could not possibly be refused. They would during the first half of 1916 receive benefit to some extent from the sliding scales in force in their agreements. The plant had been run at very great pressure, and maintenance and repairs were in consequence very high. New and larger plant was on order. In July, 1914, they seemed to have turned the corner, and they regretted that a higher dividend could not be paid. They must consolidate and secure their resources as they proposed by increasing the reserve to £20,000. Mr. T. O. CALLENDER seconded the adoption of the report.

South Metropolitan Electric Light and Power Co., Ltd.

For 1915 there is a revenue credit balance of £49,190, plus £5,591 brought forward, and a dividend of 10 per cent. on the company's holding in the West Kent Electric Co., Ltd. Debenture charges are £12,612. 7 per cent is paid on the first and 6 per cent. on the second pref. shares, £16,750 is put to depreciation account, and a dividend of 4 per cent. is payable on the ordinary shares, leaving £6,605 to carry forward. For 1914 there was no dividend on the ordinary shares. The report gives the following figures, those in parentheses being for 1914:—H.P. connected, 19,389 (15,529); consumers, 6,781 (6,468); gross revenue, £80,576 (£66,792); expenditure, £31,386 (£23,737); net revenue, £49,190 (£43,054). There was a satisfactory improvement in revenue from energy sold, but coal costs were abnormally high, and wages increased considerably. A 5,000-kw. turbo-generator is being added to cope with the demand, and it will be in commission next month. Negotiations with the debenture trustees are pending with a view to defining the obligation of the company under the trust deed as to setting aside sums to depreciations, &c. In the meantime, at the suggestion of the trustees, the £20,000 carried to reserve in 1913 and 1914 has been transferred to depreciation account, although there is no obligation to do so, no dividend having been then paid on the ordinary shares. With Treasury sanction, £10,790 first debenture stock (4½ per cent.) and 15,922 second pref. shares (6 per cent.) were issued during the year. The business of the West Kent Electric Co. has made substantial progress, the gross revenue rising from £1,596 in 1914 to £13,320 in 1915, and the net revenue from £541 to £3,051. Mr. H. E. West has been elected to the board in place of the late the Hon. L. A. Brodick. Annual meeting: March 1st.

Notting Hill Electric Lighting Co., Ltd.

The capital expended during 1915 was £1,556. The number of consumers is now 4,358, only 20 of whom are supplied at 200 volts. The lamps connected have increased from 234,608 to 258,981 (32-watt equiv.), and the profit (less income-tax) for 1915 was £92,617, as compared with £24,221 for 1914. Revenue from sale of current was £42,419, an increase of £332; the reduction of £1,604 in profit is mainly due to higher income-tax, which was £2,653, as against £1,496. There is put to depreciation, renewal, and reserve £3,000, debenture interest requires £2,267, interest, &c., on the Kensington and Notting Hill Joint Debenture stock takes £4,171, income-tax £2,653,

distributed to staff under co-partnership scheme (8 per cent. addition to wages), which is still working satisfactorily, £253. After paying 6 per cent. pref. dividend, and 5s. per share, less tax, on the ordinary shares, £337 is carried forward. Units generated or purchased, 3,343,269; units sold, 2,436,496; used on works, 18,001; expended in distribution transformers and accumulators, 888,772; public lamps, 53. Annual meeting: February 29th.

London Electric Railway Co. During 1915 the aggregate gross traffic receipts of the five companies to the agreement establishing a common fund, were £1,924,245. The aggregate receipts from all sources were £5,481,144. The amount retained by the companies for revenue liabilities (working expenses, prior charges, reserves, &c.) was £5,029,778, and the balance £451,366 is credited to the common fund. This company is entitled to 26 per cent., and receives £117,355, which, added to £11,547 brought forward, makes £128,902 available for ordinary dividend, an increase of £59,055 as compared with 1914. The dividends were announced in our last issue. Capital expended during 1915, £157,160. The traffic is satisfactory, and shows a substantial growth since the opening of the new Willesden Junction Station of the L. & N.-W.R. The total passengers and the average fare per passenger cannot be given, as the District line is under Government control. Annual meeting: Yesterday.

City and South London Railway Co. This company's share of the common fund referred to above is 2 per cent, and it accordingly receives £9,027. The total net income was £91,780, an increase of £39,830. Interest, rentals, and other fixed charges require £30,253; reserve £10,000, against nothing for 1914; preference dividend £42,500, as against £18,139; and the balance is £9,027. The dividends were stated in our last issue. The year's capital expenditure was £59,104. Arrangements were made to obtain supply of current for working the railway from the Lots Road power station, and the Stockwell power station has been closed down. Annual meeting: February 29th.

Central London Railway Co. This company's share of the common fund is 20 per cent., and £90,275 has been received, plus £15,413 brought forward. The gross receipts increased by £39,159 to £316,527, and the expenditure by £12,164 to £156,523. The net income was £160,004, an increase of £26,987. Interest, rentals, and other fixed charges were £39,131, there is put to reserve £10,000, as against nothing last year, and the preference dividend takes £21,600. The dividends on other stock were stated in our last issue. Capital expenditure during 1915, £35,440. The Treasury consented to the issue of £150,000 redeemable 4 per cent. debenture stock; this has been sold, and the proceeds will be available for the payment of commitments in connection with certain improvements entered into prior to the war. The construction of the Wood Lane and Ealing Broadway extension makes slow progress owing to the war. A year's extension has been granted for exercising the compulsory purchase powers under the Central London Railway Act, 1913. Annual meeting: Yesterday.

Metropolitan District Railway Co. This company being entitled to 12 per cent. of the common fund receives £54,164, plus £13,888 brought forward. The receipts of the undertaking during 1915 were £1,066,247, and the expenses £511,721. Interest, rentals, and other fixed charges required £350,432; there is put to reserve £35,000; the dividends are as stated in our last issue, and £13,952 is carried forward. Capital expenditure of 1915, £17,059. Annual meeting: Yesterday.

Smithfield Markets Electric Supply Co., Ltd. SIR H. S. LEON, presiding at the annual meeting last Friday, said that the increase of £1,355 in the capital account included the balance of the cost of the Diesel plant, in regard to which a satisfactory settlement had now been arrived at with the Diesel Co. The new set, which would be at work in a few months, would enable them to make a thorough overhaul of the existing ones. In regard to the heavy increase in cost of production, their oil contract carried them over last year. It was now double the price, and charges to consumers had had to be raised. The total cost of generation in 1915 was 6 per cent. higher than in 1914. At the quinquennial valuation their rateable value was considerably increased, but on appeal the original figure was restored. Receipts from sale of current were higher, but the total receipts were less, as consumers were disinclined in wartime to spend money on extensions and alterations. The net profit was £324 less than in 1914. A serious accident occurred on 7th inst. One of the compressors of a Diesel engine exploded, killing one man and wounding another. The cause was being investigated.

Bristol Tramways and Carriage Co., Ltd. During 1915 the gross receipts were £512,385, and the working and general expenses and renewals were £413,521, leaving £98,864. After paying debenture interest, carrying £4,364 interest on investments to reserve, paying the preference dividend, and 5 per cent. for the year on the ordinary, less income-tax, £20,000 is carried to reserve fund for contingencies and renewals, and £9,006 is carried forward. The receipts of the

tramways department increased by £8,703 (3.63 per cent.), and those of the carriage department by £49,017 (23.39 per cent.). Passengers carried were 60,272,400, an increase of 1,970,815. No fewer than 1,095 of the company's employes joined H.M. Forces. The depletion of the staff necessitated restricted public services. A motor omnibus service between Tewkesbury and Cheltenham has been inaugurated, but other new services remain in abeyance. Communications have passed between the Corporation and the company with reference to the former's purchase option, but without result. As the Treasury has refused consent to any public issue of stock by the Corporation for the purpose of tramway purchase the directors offered for the purchase price to be satisfied by the issue of Corporation stock to return half per cent. more than the market yield of Government stock at the date of the award. The offer has not been accepted, but it cannot remain open indefinitely. Annual meeting: March 2nd.

Rushden and District Electric Supply Co., Ltd. During 1915 the number of consumers increased from 79 to 123; lamps and motors by 6,380 to 11,941; and the units sold were 249,783, nearly 4½ times more than in 1914. The H.P. of motors increased from 10½ to 29½, of which 29½ is let out on hire. The mains have been extended. Maximum load increased by 109 kw. to 183 kw. Revenue from sale of current advanced from £463 to £1,699. The rapid development of the undertaking has called for extensions, and a new plant which will practically double the capacity of the works will soon be got into commission. After putting £300 to depreciation, and paying 3 per cent. dividend, £90 is carried forward. Annual meeting: March 2nd.

Northampton Electric Light and Power Co., Ltd. The results for 1915 are all that could have been desired. A favourable coal contract covering the earlier part of the year balanced the high prices paid in the latter half. Costs of other materials increased. 31,476 new lamps were connected, making 223,257. 733 H.P. was added in motors, making the total 4,668 H.P. New mains and feeders were laid, and the output was 5,055,643 units, as compared with 3,953,700. The existing station and site leave no room for expansion, and a large site purchased near Nunn Mills has been approved by the Board of Trade. A new generating station will be proceeded with as rapidly as present circumstances allow, also a railway siding for more economical conveyance of coal, &c. The general depreciation account has been increased by £6,750, £665 has been written off motors, and £1,750 added to reserve. After paying 5 per cent. on the preference shares and 6½ per cent. for the year on the ordinary, £3,114 is carried forward.

Kensington and Knightsbridge Electric Lighting Co., Ltd. —The number of houses and shops connected increased by 70 to 5,011 during 1915, and the lamps connected from 488,912 (14,660 kw.) to 510,785 (15,320 kw.). The lighting restrictions reduced the units sold by 9 per cent., entailing a still larger percentage of reduction in net profit. The available net profit is £11,653, plus £1,629 brought forward. After paying the preference dividends and 7 per cent. on the ordinary for the year, £432 is carried forward. The renewal and reserve fund has been increased by £7,137 to £139,021. Annual meeting: March 2nd.

Para Electric Railways and Lighting Co., Ltd. —The gross receipts decreased from £249,891 in 1914 to £243,483 in 1915. The operating expenses were reduced from £132,491 to £115,309, the net revenue earned in Para being £128,174, as compared with £117,400. The accounts are based upon the legal exchange rate of 16d. per milreis, and £33,205 must be deducted as the actual loss incurred on remittances. After providing also for the London expenses, the balance of operating revenue is £90,759, compared with £106,147 of the previous year. After paying debenture interest and preference dividend, and putting £15,000 to depreciation and renewals reserve, a dividend of 5 per cent. for the year on the ordinary shares, less income-tax, is paid, carrying forward £18,995.

Mexican Tramways and Light Companies. —The "Financial Times" states that circulars have been issued to bondholders of the Mexico Tramways Co., Mexican Light and Power Co., Mexican Electric Light Co., and Pachuca Light and Power Co., stating that in view of the difficulties of the companies caused by the unsettled conditions in Mexico, Messrs. E. R. Peacock (chairman), S. C. Boulter, H. F. Chamen, R. Fleming, A. Hill, H. M. Hubbard, and A. F. P. Roger have agreed to act as a committee for the protection of the bondholders' interests.

Mersey Railway Co. —The auditor has certified that the revenue available for 1915 amounts to £21,442, as against £21,279 for 1914. With the exception of £164 which is carried forward, this amount is distributed thus:—4 per cent. on 1866 stock, 3 per cent. on 1871 stock, 3 per cent. on 1882/3/5 stock, and 1 per cent. on the "B" debenture stock. Annual meeting: To-day.

Beaulieu Electric Supply Co., Ltd. —Mr. D. McGRATH presided at the annual meeting last week. Satisfactory progress, with an increase of 10 per cent. in the output, was reported. The profit was £140. A dividend of 6 per cent. was declared, £16 being carried forward.

Bournemouth and Poole Electricity Supply Co., Ltd.—Final dividend on the ordinary shares at the rate of 7 per cent. per annum, less income-tax, making 6 per cent. for the year, as against 7 per cent. for 1914.

Oxford Electric Co., Ltd.—A final dividend of 3½ per cent., less income-tax, is declared, making 6 per cent. for the year, as compared with 6½ per cent. for 1914.

Newcastle-upon-Tyne Electric Supply Co., Ltd.—Final dividend on the ordinary shares 3½ per cent., making 6 per cent. for 1915, as against 5½ per cent. for 1914.

Direct West India Cable Co., Ltd.—Interim dividend at the rate of 6 per cent. per annum, free of tax, for the past half-year.

Halifax and Bermudas Cable Co., Ltd.—Interim dividend at the rate of 6 per cent. per annum, free of tax, for the past half-year.

Mirrlees Watson Co., Ltd.—A dividend of 5 per cent., less tax, is recommended.

STOCKS AND SHARES.

TUESDAY EVENING.

The incidence of the coming taxation hangs like a cloud over all the Stock Exchange markets. It was very much the same when the 2½ per cent. War Loan was coming; and for six weeks at that time markets were listless, apathetic, depressed. After the Loan had been issued and allotted, financial matters got tidied up, and business improved. So it is likely to be again, because there is plenty of money about for investment, and the only thing which the Stock Exchange really hates and fears is uncertainty.

The most important event of the week, so far as the electrical markets are concerned, is the issue of an appeal to bondholders in the Mexico Tramways, Mexican Light & Power, Mexican Electric Light, and Pachuca Light & Power Companies, who are invited to deposit their bonds, at as early a date as possible, with a committee that has been formed for the protection of the interests of the bondholders. A lengthy circular recalls the statement made by the Mexico Tramways Co. last summer, and quoted on several occasions here, with reference to the difficulties under which the companies were labouring.

Put briefly, the present committee's endeavours will be directed to securing such guarantees as will ensure that the tramways property, when taken back, can be worked with proper protection and under such conditions as will safeguard the bondholders' interests; while questions affecting the Light and Power companies are arising almost daily, and involve matters of policy that call for important decisions. The committee is a strong and workmanlike body, and the deposit of the bonds with the committee may well be recommended to the proprietors.

Prices in this market have been little affected, save for a fall of 1 point in Mexican Light common, by the step thus taken, but for Mexican issues as a whole there has been just a slight demand during the past few days. Affairs in the positions of various companies have reached a pass well-nigh desperate, and as the committee may be able to do something to mend the fortunes of these unhappy concerns, they are deserving of every encouragement and support.

Brazil Tractions have been moving between 53 and 51½, being at the moment nearer the lower point because of a disappointing slip back in the Rio exchange. The rate went just over 1s. last week, only to ease off to 11¼d. The bonds of the Rio Tramways Co., however, are steadily maintained at 88½ for the Firsts and 73 for the Seconds. The Argentine Tramways group is steady, without showing any particular movement.

The London General Omnibus Co. issued its report early in the present week, and the company's receipts of £2,882,400 are £340,000 less than they were in the previous year, while expenditure was only reduced by £253,000. The dividend comes down from 16 per cent. to 12 per cent., but the latter is paid free of tax, instead of being gross, as it was in 1914, so that the actual shrinkage is less than appears. Underground Electric Income bonds are rather sellers at 85, but the £10 shares are 3/16 lower at 14, while the 1s. shares fell back to 5s. 6d.

Railway stocks as a whole are heavy. Two of the steam lines are making new issues of stock—an example which it is thought likely may be followed by others, unless the public reception to the newcomers is not favourable. Which, by the way, is likely enough, because the terms offered are none too tempting. Undergrounds are heavy with the rest; and the adoption of electric traction by the South-Western Railway has had no influence, so far, upon the prices of the stocks. Falling again into remembrance, it may be recalled that the result of the Brighton Railway's electrification did not benefit the prices of the stocks until some months after the new system had been in operation.

Reduction of dividends in the electric lighting market is emphasised by a decline in the Kensington distribution from 9 per cent. to 7 per cent. Prices in this department are steady, and there is rather more business than usual doing in some

of the shares. London Electric ordinary are ¼ lower, but there has been a little improvement in County preference, and these are the only changes on the week, as will be noticed from our share list.

Eastern Ordinary is the firmest spot in the telegraph market, and there is a rise of ¼ in Chili Telephones. Marconi are a trifle easier. New York Telephone bonds continue to be wanted by the Government at 101½. It had been expected that some announcement would be made by Mr. Asquith, in his speech on the Vote of Credit last Monday night, with reference to the amount expended up to the present by the Government in the purchase of American securities, but apparently the figures are not available.

Of the manufacturing shares, Callenders make the best showing, with a rise of 5s. to 11½. Henleys are also a good spot at 14, the price being, of course, full of the dividend for the "fat" half of the year; anticipation looks for the announcement to be at the usual substantial rate.

British Westinghouse preference again lost 6d., but the market in the shares is not a bad one. There has been a little buying lately of the company's 6 per cent. prior lien debentures, the security for which is admirable; and the price of 102½ carries the £3 interest due on April 1st. Other industrials are firm. The rubber market has gone back a little by reason of a decline in the price of the raw stuff. This led to profit-taking amongst some of those who had been speculating in the shares. Business fell away considerably in volume. Advantage has been taken of the reaction by people who sold shares which they were unable to deliver, and their purchases sufficed to keep the market steady as a whole.

EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING JANUARY, 1916.

THE returns of electrical exports for the first month of the year show an appreciable improvement on the December position, the month's exports having advanced from £349,409 in value in December to £381,599 in January. The electrical imports, on the other hand, fell away in value, the month's business amounting to only £216,407, as against £238,691 in the previous month; the re-exports also receded to £10,612 in value from £24,382 in December.

The improved export total was mainly due to increased telegraphic, telephonic and battery exports during the month; cable export

values remained stationary at a high figure, while machinery exports fell off considerably.

A marked decrease took place in machinery and cable import values, and in certain other directions lower values were recorded, while the only noteworthy improvement on the December figures was in telegraphic, telephonic and battery imports. Our most prominent customer during the month was India (£66,000), while France purchased nearly £40,000 worth of electrical material from us; our Australian Colonies and Argentina were also good customers. United States imports fell off as compared with December, as also did Dutch lamp imports.

Registered Exports of British and Irish Electrical Goods from the United Kingdom.

Destination of exports and country consigning imports	Electrical goods and appliances.	Wires and cables rubber and other insulations.	Electric lighting fittings and accessories.	Electric glow lamps.	Electric arc lamps and lamp parts.	Electric meters and instruments.	Electric machinery.	Electrically-driven machinery.	Batteries and accumulators.	Carbons.	Telephonic cable and apparatus and electric bells.	Telegraphic cable and apparatus.	Total.

TOTAL EXPORTS: £381,599

TOTAL RE-EXPORTS: £10,612

TOTAL IMPORTS: £216,407

NOTE.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third columns contain many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country whence consigned, which is not necessarily the country of origin.

A TURBO-GENERATOR STEAM CONSUMPTION TEST.

BY A STATION SUPERINTENDENT.

ENGINEERING has its trials, more especially in war time, and if it were not for the absorbing interest of the many problems that face the engineer, and give him occasional tastes of pure pleasure in solving them, the profession would easily be an alternative to a suicide club. Perhaps one of the deepest joys is planning and carrying out a steam consumption test. This pleasure was sufficiently marked in the old days when the indicator diagram and the weight of steam used were the chief factors, but the advent of electricity and the accuracy with which it can be measured has deepened the interest in proportion, no doubt, to the increased satisfaction to be derived from a nearer approach to the truth.

Let us suppose we are about to test a 5,000-kw. turbo-alternator. There is much interesting and careful preliminary planning, and to go back to the earliest stages we should consider the drawing up of the specification for the plant. The specification will determine at what time during the maintenance period the test should be taken; usually after a month or two's continuous run of the plant. It will call especially for a guarantee from the makers of a steam consumption per kw.-hour under certain given conditions of: (a) Steam pressure, (b) steam temperature, (c) vacuum, at overload, full load, three-quarters load, and half load. It will describe shortly the methods to be adopted in taking the test, and will say who provides the necessary apparatus, tanks, instruments, etc. The important clause is the one dealing with the guarantee, and some such wording as given below may be adopted.

"Should the steam consumption be greater than at the rate of lb. per kw.-hour at approximately full load, for each and every complete tenth of a pound of steam in excess of a margin of $2\frac{1}{2}$ per cent. a sum of £400 will be deducted from the contract price. Should the steam consumption be less than at the rate of lb. per kw.-hour at approximately full load, for each and every complete tenth of a pound of steam saved beyond a $2\frac{1}{2}$ per cent. margin a sum of £400 will be added to the contract price."

The figure of £400 will naturally vary with the value to the buyer of the gain or loss to him under his peculiar conditions. The contractor will insert the figure for steam consumption in tendering, and a further clause will give the purchaser the option of refusal to accept the plant should the consumption be, say, 10 per cent. above the guarantee.

So much for the specification, and it would appear simple enough to reproduce the conditions specified, to agree on how to take each reading, and to obtain a figure satisfactory to both parties.

To those who would tread this path happily, the writer would, however, sound a note of warning, and indicate that however much both the customer's and the contractor's engineer may have started out with a pure and firm intention to seek the truth, human nature will out, especially with a bonus in sight. So the best of intentions suffer, and things are apt to go awry.

Sad to relate, the writer has known human nature to fall so low as to exhibit a deliberate intention on the part of the respective engineers to hoodwink and deceive each other. However remote a contingency this may be, and the reader will guess its remoteness, it is well to provide for it. So before starting the test the parties should agree: (a) on how many readings shall be taken; (b) on what corrections are to be applied should the results obtained vary with the specified conditions. In this connection the following notes may be found of use:—

1. *Steam Condensed*.—The steam condensed should in all cases be weighed. This may be done satis-

factorily by obtaining two large tanks, each of which will take about 10 to 15 minutes to fill on full load test. If of wrought iron, the tanks should be well stayed to prevent distortion on filling with water, and should be set on a weighbridge, previously checked by dead weights, and supported thereon by timber laid across underneath in a certain marked position. The tanks should be weighed empty and full, and the temperature of the water taken at the time. Care must be taken to mark the water level clearly on each side of the tank when full, and this level must be reproduced by adjustment of the tank support when the tanks are re-erected and supported ready for test.

The two tanks should be placed side by side and the condensate led to them by a pipe branched to each tank, each branch being controlled by a quick-acting lever-actuated valve. These valves should be worked alternately by the customer's and the contractor's man, the former being inclined to cut off the water a shade too soon and the latter a whit too late.

The time taken to fill each tank should be taken carefully, and particular note should be taken, preferably by a chronometer, of the start and finish of the test of; say, about four hours. It will usually be most convenient to stop at a "tank full," provided that the electricity meter reading is taken at the same time.

The correction in the weight of condensate to be applied on account of the variation in temperature between the water as weighed on the weighbridge and the condensate should be agreed upon. The agreement should present no difficulties, as the facts are well known.

2. *Steam Pressure*.—The steam pressure should be taken on the boiler house side close to the main stop valve, and the pressure gauge used should be checked before and after the test by a standard instrument. The steam consumption is affected to a comparatively small degree within the usual variations of boiler pressure, but it is essential as far as practicable to obtain a steady pressure even if it be a little over or a little under that specified. Table I gives the corrections to be applied in this connection, and follows modern accepted opinion.

Pressure in lb. per sq. in.	Allowance to be made, + per cent. - per cent.
170	+ .25
175	+ .125
180	.00
190	-.25
195	-.375
200	-.50
205	-.625
210	-.75

TABLE No. I.—Showing per cent. allowance to be added to or deducted from the steam condensed for variation in steam pressure. Steam pressure taken as 180 lb. per sq. in.

3. *Steam Temperature*.—The steam consumption of a set such as that under consideration will vary as much as 1 per cent. for every 10 deg. F. variation in steam superheat above 500 deg. F., and 1 per cent. for every 12 deg. F. below that figure. The importance of taking careful and accurate readings will therefore be understood.

The steel thermometer pocket should be located close to the pressure gauge above mentioned, and should extend well towards the centre of the steam pipe. It should be filled with mercury or cylinder oil, and the thermometer should be one that has been calibrated and certified as correct. Further, this thermometer, together with others used on the test, should be tested in boiling water immediately after the official run as a further check.

Table II gives corrections for variations in steam temperature, and is one now commonly accepted, but this is a matter which should be made a subject of agreement between the interested parties before the official test is made.

Degrees Fahr.	السف	Allowance to be made, + per cent. - per cent.
480	...	+ 2.00
485	...	+ 1.50
490	...	+ 1.00

540	...	- 3.33
550	...	- 4.16

TABLE No. II.—Showing per cent. allowance to be added to or deducted from the steam condensed for variation in superheat. Steam pressure taken at 180 lb.

4. *Vacuum*.—This, perhaps, is the most important point to watch, as a small departure from the specified figure calls for considerable correction. Here again the exact percentage correction to apply to any given variation from the specified vacuum is a matter for research and agreement by those concerned, but Table III indicates fairly closely commonly accepted figures.

Per cent. of atmospheric pressure.	السف	Allowance to be made, + per cent. - per cent.
85	...	—

94	...	+ 2.00
9500
96	...	- 2.00
97	...	- 4.00

TABLE No. III.—Showing per cent. allowance to be added to or deducted from the steam condensed for variation in vacuum.

The exact point at which the reading should be taken is frequently a matter of discussion, and rightly so, as the vacuum varies considerably between the last row of the L.P. turbine blading and the top of the condenser. The contractor's engineer will be found to exhibit a desire to drill the hole well up the exhaust leg some feet above the floor level. He will thus obtain a lower vacuum, and be thus entitled to a larger correction in his favour. On the other hand, by the way, if it is a question as to the condenser itself being of sufficient capacity to give the specified vacuum, he will quietly insist on making his gauge connection close to the condenser inlet. The point to be tapped should be previously agreed upon, and, in the writer's opinion, should, in fairness, always be taken half way between the centre of the turbine shaft and the top row of the condenser tubes. This will generally be found to be approximately floor level in the usual type of horizontal turbine.

The vacuum should be taken by the simplest means; that is a column of pure mercury in a straight tube, of which the height can be carefully measured. It is necessary at the same time to take careful barometer readings, the latter instrument being placed at the same level as the mercury column. If this be found impossible, then the necessary correction for difference in height of the two instruments must be applied. It is always wise to check the barometer from some recognised standard instrument, which may, however, again be at a different level.

5. The electricity generated must be measured by a kw.-hour meter of careful design and manufacture, certified immediately before and after the test for correctness.

With the above main features in mind and other small matters attended to, such as checking the condenser for leakage before and after the run, and

agreement as to inclusion of steam or power used on steam or electrically driven auxiliaries, the test may begin.

The most careful and experienced men should be chosen to take the readings of weight of condensate, steam pressure and temperature, the vacuum and the electricity meter, the remainder being told off to take the various readings which will be found afterwards necessary in the continuous operation of the set.

These readings will include:—Temperature of condensate, temperature of circulating water inlet to condenser, temperature of circulating water outlet of condenser, speeds of main plant and auxiliaries, pressures and vacua of air and c.w. pumps.

The men should work in pairs consisting of a representative of the buyer and seller, and they should agree on every reading taken.

Generally four hours' running with a steady load will be found sufficient to obtain the necessary accuracy for a full load test, provided the plant has been running at approximately full load for four to six hours before the test starts—a wise precaution in all tests of this character.

Fifteen-minute readings will be found sufficient, but the time taken to fill each tank with condensate, together with the electricity generated within that time, should be noted separately.

It will be found, with these precautions, that a very enjoyable test will be experienced, and both parties may look to the result with eagerness and confidence.

BRITISH MANUFACTURING AND THE RUSSIAN MARKET.

We refer in our leader pages to an article which recently appeared in *Elektrichestvo*, of Petrograd, from the pen of Engineer P. GREVITCH, on the prospects of electrical trade between Russia and England. The writer says that the interruption of the German importation of electro-technical goods into Russia, which grew from 14,140,000 marks in 1909 to 34,505,000 marks value in 1913, constrained Russian importers to turn for such goods to other countries, particularly England. Unfortunately, however, while Russian buyers, faced with the necessity of filling up the blank that has been formed, are greatly interested in English goods, the English electro-technical industry—with a few exceptions—does not feel any special need of new markets, and, therefore, has not shown any particular interest in the Russian market. The writer says that this lack of interest may be partly due to temporary war conditions, but it is also based, unfortunately, on a variety of causes which are not of a transitory nature. Taking advantage of the information that he has collected, he proceeds to show the causes of the relatively feeble interest of the English electrical industry in the Russian market, after explaining its exports and its position in the world market. Electrical development in England itself is not particularly large compared with that of other countries. This is explained largely by the great prevalence of gas works in the country. England, with its cheap coal, as is known, was the pioneer in the business of gas lighting. At the present time there are 1,622 gas works in England, whilst in all Germany there are but 552; in Russia but 22. Further, in Paris, the output of gas per annum is 500,000,000 cubic metres; in Berlin, 300,000,000; in Vienna, 120,000,000; in Warsaw, 36,000,000; in Petrograd, 19,000,000; and in Moscow, 13,000,000. But every year the output of gas in London makes 900,000,000 cubic metres, that is to say, as much as in Paris, Berlin, and Vienna. Naturally, says the writer, owing to this great prevalence of gas lighting in England, electric lighting is by so much less developed. The use of electric power in London was 110 kw.-hr. per head of the population in 1910-11; in Berlin in 1911-12 it was 170 kw.-hr.; in Chicago, in 1911, 310 kw.-hr.; and so on.

The development of the English electric stations has been hindered not only by the number of gas works, but partly, also, by the fact that in England about 55 per cent. of all the stations are under municipal control, whilst in Germany 25 per cent. only of all the electric stations belong to municipalities. The small productivity of electric stations in London is explained to a certain extent by the fact that they are extraordinarily diverse. This great drawback of variety is also the defect that afflicts Petrograd in respect to its electric power supply. The use of electric equipment in England per inhabitant, according to a German estimate, amounts to about 2 roubles 83 copecks per head, whilst each inhabitant

of Germany spends on electro-technical apparatus 7 roubles 36 copecks. But this relatively small quantity of electro-technical apparatus used in England was not all made in England itself. The importation during the past two years from Germany alone of electro-technical apparatus per annum reached 31,000,000 marks value, which makes about one-fifth of the total quantity of electro-technical apparatus used in England; whilst in Germany, with an annual production of 1,200,000,000 marks, there was an export in 1912 of 272,000,000 marks value (that is, 22.5 per cent. of the production) and in 1915 of 330,000,000 marks value (an increase in the export of 21.3 per cent.), and the export of electro-technical goods from England worked out in thousands of roubles as follows:—

	1907.	1911.	1912.	1913.
Total electro-technical goods ...	34,366	45,619	51,513	71,477
Electrical machines ...	9,292	16,836	18,400	21,469

It is to be observed in connection with this, that the year 1913 was a very satisfactory one for the English electro-technical industry, for its export, in comparison with 1912, rose by nearly 40 per cent., whilst the increase in the German export compared with 1912 improved only by 21.3 per cent.

The cable industry in England is very highly developed, and is one of the oldest and most flourishing branches of the electro-technical industry. This great consumption in England of cables is explained particularly by the submarine telegraph lines, and so on. Thus in 1913 the export of cables made nearly half, or 47 per cent., of the total English exportation of electro-technical goods, whilst the value of the cables exported amounted to £3,577,663 sterling. Submarine cables alone were exported to the value of £1,503,915; in other words, about a quarter of the total English export (to be exact, 25.2 per cent.) of her electro-technical goods was made up of submarine cables. For Russia, however, this extraordinary development of a branch of the English electro-technical industry in respect to changing over from importation from Germany is not of much importance, for, thanks to the high protective tariff on cables in Russia for some years back, with the active co-operation of foreign capital, this has been so far developed that nearly all the consumption in cables and insulated wire can be covered by the production of Russian factories, at the head of which stands the United Cable Factories of Petrograd, with a capital of 6,000,000 roubles (the last dividend was 15 per cent.), and the Kolchugin Latten and Copper Rolling Works Co., at Keleroff Station, Northern Railway, the production of which in the near future will probably increase, for the capital of this company was lately increased from 6,000,000 to 10,000,000 roubles. The importation of cables into Russia reached in 1913 155,000 roubles value, whilst from Germany the importation amounted to 81,400 roubles.

Russia does not require much of English telephone and telegraph apparatus, the exportation of which from England in 1913 was £290,279 sterling value. As the chief consumer of such apparatus in Russia is the Post Office Department, which orders them exclusively in Russia, the production of these apparatus has so far developed that the needs of the country can be supplied by existing Russian factories, at the head of which stand the Russian L. M. Ericsson & Co., in Petrograd, which recently increased its capital from 2,000,000 to 4,000,000 roubles; the Russian Siemens & Halske Co., capital 5,600,000 roubles, latest dividend 6 per cent.; and the N. K. Geisler Co., of Petrograd, 1,000,000 roubles capital, latest dividend 12 per cent.

The importation of telegraph and telephone apparatus in 1913, according to Russian statistics given in the *Elektrichestvo*, makes a total of only 363,000 roubles. These figures, however, do not agree with the German statistics, according to which, in 1913 there was exported from Germany to Russia, telegraph apparatus to the value of 188,000 marks, and telephone apparatus to the value of 1,079,000 marks; total, 1,267,000 marks, or 583,000 roubles. In 1912, the export from Germany to Russia of these apparatus reached a total of 562,000 roubles, whilst, according to Russian statistics, this importation of telegraphic and telephonic apparatus was in 1912 only 240,000 roubles. Since German statistics are generally very exact, we must suppose that part of the imported telegraphic and telephonic apparatus from Germany are entered in the Russian import list under some other heading.

Already the export alone from Germany into Russia is more than one and a half times the whole Russian importation shown in the Russian statistics; while, according to Russian statistics, in 1912 there was imported from Germany only half of the total quantity of imported telegraphic and telephonic apparatus, one-third being imported from Sweden and one-sixth from other countries.

The acquisition of English carbons for arc lamps, for which in Russia, in consequence of the interrupted imports from Germany (amounting in 1913 to 447,000 marks value), at present there is a great want, unfortunately cannot be counted on. In England the production of carbons for arc lamps is even less developed than in Russia, since there is only one factory of the kind. In view of this cessation of imports of carbons from Germany, the exportation of such from England was forbidden with the opening of hostilities, so that England itself imports carbons from Sweden, Switzerland, and so on. In any case, the export of carbons from England in 1913 reached a value of only £10,064. England's exportation of incandescent lamps is also small. In 1913 England's export made £152,456 sterling value. The total English export of

incandescent lamps was less than the German export of these lamps to Russia alone. In 1913, according to German statistics, there were exported to Russia 7,669,105 electric lamps with metal filament, value 7,206,000 marks, and 1,553,889 lamps with carbon filaments, value 765,000 marks; total, 8,084,000 marks, equal to 3,709,000 roubles. In 1912 this item was even larger, viz., 8,854,000 marks for metal filament and 617,000 marks for carbon filament, total 9,471,000 marks. Again, the German statistics do not agree with the Russian, for according to the latter the total Russian importation of incandescent lamps was 3,849,000 roubles in 1912.

The feeble development of English production of incandescent lamps may be partly explained by the fact that only two English factories of electric lamps work with English bulbs. All the others obtain theirs from the Continent, which certainly makes the production dearer. The last fact is seen also in many other branches of English electrical industry, particularly in the production of various equipment material such as porcelain, glass goods, &c., which might often, indeed, be made in England; but, unfortunately, these auxiliary branches of the electro-technical industry are not sufficiently developed in England. The value of the English exportation of arc lamps and projectors was only £14,512 in 1913, whilst into Russia alone Germany exported in that year 12,369 arc lamps, valued at 652,000 marks; parts of arc lamps valued at 79,000 marks; and projectors valued at 500,000 marks; total 1,231,000 marks. England exported in 1913, £51,828 sterling value in parts of arc and incandescent lamps, including £19,737 value to Russia. Electric batteries and accumulators in that year were exported by England to the value of £226,325; but for Russia this branch of English electro-technical industry is, again, of but little importance, for the production of accumulators in the Russian factories can now be almost entirely covered by the national workshops. The importation of accumulators, according to Russian statistics, made in 1913 55,000 roubles value only, but the importation of galvanic batteries, not specially indicated in Russian statistics, from Germany alone, according to German statistics, made a value of 340,000 marks.

Respecting the important group of electro-technical manufactures which is indicated in English statistics under the title "not specially named manufactures and apparatus for electro-technicians," with a total exportation of £1,063,146 sterling, Russia received £16,007 sterling; that is scarcely 1½ per cent. of the total export. In this group, besides various ornamental materials in which England can scarcely hope to compete in Russia with other countries, there are also electrical measuring apparatus, meters, &c. The production of these instruments in England is considerably advanced, and their export into Russia might be increased. In view of Russia's great necessity it increased considerably in 1914.

Of the electro-technical manufactures under the above group, Russia imported in 1913 from Germany alone 8.7 electrical apparatus, 8,967,000 marks, against 5,431,000 marks in 1912. Electric apparatus for heating, &c., 321,000 marks; electric signalling apparatus, 667,000 marks; electro-medical apparatus, 894,000 marks; insulation tubes, 273,000 marks; wireless telegraph apparatus, 111,000 marks; electric measuring apparatus, 4,247,000 marks (against 3,143,000 marks in 1912); insulating articles in asbestos, mica, &c., 76,000 marks; electrodes, 173,000 marks; or a total of 35,729,000 marks.

The first position, after the cable industry, in England is occupied by the production of electrical machines; therefore, on this branch M. Gurevitch dwells more fully, especially as in the Russian importation of electro-technical products dynamo machines and electric motors occupy the first place. Therefore, the possibility of increasing the importation of electrical machines from England becomes a question of considerable interest to Russian buyers of that class of goods.

The total export of electric generators and motors to Russia according to the official statistics of England, Germany, and Switzerland was valued at 5,440,000 roubles; but according to Russian statistics, as published in the *Elektrichestvo*, the importation thereof made 9,595,000 roubles. If we add to the 5,440,000 roubles the value of the importation of electrical machines from Austria, Belgium, France, and Switzerland, which made in 1912 only 7 per cent. of the total importation, then this sum would be only slightly increased. It remains, therefore, to suppose that under the heading electrical machines, there is included in the Russian statistics, besides dynamo machines and electro-motors, all other machines driven by electric current, for example, electro-magnetic separators, and so on. Part of the difference may still be explained by the fact that Germany, Switzerland, England, and other exporting countries give the export price, whilst the Russian statistics report the import price, that is, the price of the exporting country, plus the cost of transport, insurance, &c. But certainly the difference of nearly 4,000,000 roubles is not so explained, and it is regrettable that owing to inaccuracies in the figures in the Russian statistics the actual exchange of goods is confused, and one is led (by using Russian statistical data) to incorrect conclusions. According to Russian data, for example, the importation of dynamo machines and electro-motors is of almost twice the value shown in foreign statistics. The difference, in fact, is nearly half a million roubles more, for in the German export of electrical machines the author has added also the importation of armatures, commutators, &c., which parts in the Russian statistics are classified separately, although to a very much reduced extent compared with German statistics.

Taking advantage of the occasion, M. Gurevitch quotes one more inexactitude in the Russian statistics. These describe as German goods many articles of English, Swiss, and other origin, but imported over German railways because of the intermediate position of Germany, and the same applies to all goods arriving by steamer from Hamburg, which were described in Russia as German goods, although they may be of foreign origin, and only the last part of the way has been covered on a German steamer. Thanks to the foregoing, the importation of electrical machines from Switzerland, which made the solid sum of 1,250,000 roubles, by no means corresponds to the Russian statistics. As these machines were carried through Germany, they were described as German machines. Although, in fact, the importation of these machines from Switzerland is almost twice as large as from England, in the *Elektrichestvo* table they are not noted at all, whilst the importation from Sweden, making only one-tenth of the importation from England, is correctly described, since Swedish machines do not pass in transit through any other country. It may therefore be said with confidence that the importation of electro-technical manufactures from Germany is exaggerated in the Russian statistics, and the importation from other countries is underestimated. The question of the introduction of uniform statistics in all countries had been near to realisation not long before the war, for on the initiative of the Belgian Government, representatives of twenty-nine Powers, including Russia, were to meet in Brussels for the preparation of uniform statistical reports, but on account of the war this congress was not held. It is hoped, however, that this important question for making plain the real exchange of goods of various countries and the part they take in the world's business will be duly considered after the war.

Following this slight digression, made in view of the importance of statistics for establishing the real importation of foreign electrical goods into Russia from foreign countries, M. Gurevitch returns to the original point.

From the foregoing particulars on the importation of electrical machines into Russia, it follows that the Russian market for English manufacturers of dynamo machines and electro-motors was not an important one before the war. Whilst Germany sent in 1913 into Russia 12.6 per cent. of all her export of electrical machines, totalling, with armatures and commutators, 7,867,000 marks, England sent into Russia only 2.7 per cent. of its total export of these machines. Even Switzerland exported these machines to Russia to twice as great an extent as England. Germany, on the other hand, exported six and a half times as many as England. Meanwhile, dynamo machines and electro-motors happen to be that department in which England, previous to the war, could compete more or less successfully with Germany on the Russian market.

On the causes of this indifference of the English to the Russian market M. Gurevitch dwells in somewhat more detail, having examined the export of electro-technical manufactures from England to foreign countries. In the distribution of material included in the English official statistics, he divides the countries that are buyers of English electro-technical industrial manufactures into four groups. In the first are the English Colonies, Australia, India, South Africa, Canada, &c. In the second, South American Republics. In the third, Trans-Oceanic countries, Japan, China, United States, &c.; and in the last, European countries. The centre of gravity of English exports lies first in the English Colonies, whence over half of all the English electro-technical manufactures are exported. One-seventh of this export goes to South America; 11/100ths to Trans-Oceanic countries, and one-tenth to Europe. The stronger the competition of other countries was on the European market, and the more difficult became the export there the less interest did the English exporters take in it; because for them, until recently, there was an immense market in the English Colonies, where the English have a variety of advantages compared with other competitors. For export into these countries, the English exporter does not require to learn foreign languages, and for the transport of the goods he uses the immense English fleet, and so on.

The English Press advises the English merchant to turn his attention to these markets, as recently the competition of the German electricians has increased enormously there. The success of Germany in the English Colonies, in the opinion of the English trade Press, is explained to a large extent by the fact that the German merchants maintain large stocks there, thanks to which they can serve clients not only cheaply but quickly, which in many cases is very important for the client; and this, no doubt, explains to a large extent the success of the German firms on the Russian market too.

In view of the great competition of Germany in England, this classical country of Free Trade, recently, with growing frequency, there has arisen a voice on the necessity of introducing protective duties for the English industry. Conservative circles particularly call for these duties, and that such, at the end of the war, will be really introduced is very possible, for they will be particularly useful in the acquisition of fresh revenue.

If, however, England, with these additional duties, is put in a condition to preserve the English Colonies as a market for its electro-technical industry, then the English exportation to South America, which had been for England, after the Colonies, the best market, will doubtless fall away. In consequence of probable difficulties to German exports in the countries with which Germany is carrying on war, the German

electro-technical industry will be obliged to devote much more attention to South America than hitherto. But already, before the war, South America was the best market for the importation of German electro-technical manufactures. The Argentine occupied the first position in 1913 in this respect amongst all other countries. If the export of Germany to European countries declines, then she will endeavour to press out the English electro-technical manufactures, at all events from South America. With reduced German prices, and long credit, which the German industry is in a position to give, probably she will succeed.

At the same time, it must still be remembered that in the United States, the question of seizing the South American markets is now greatly considered. The exportation of electro-technical goods from the United States has considerably increased recently. As the United States can become a large provider of electro-technical goods in the future on the Russian market, a number of figures are given by the author showing the business recently done by America. With the proximity of the South American markets to the United States of North America, and the existing good condition of trade, they will doubtless succeed, he says, in pressing out a considerable part of the English electro-technical goods from South America. The Secretary of the Department of Trade of the United States recently advised American financiers and industrialists to follow the example of Germany, and finance various technical projects in South America. Thanks to this system, Germany has acquired not only a profit on the capital owed to the German banks, but also the orders for machines, and so on. It is known, for example, that the A.E.G., not long before the war, completed a majestic, many million project of underground electric lines in Buenos Aires. Whether Germany or the United States obtains the South American market is all one. Undoubtedly the suffering factor after the war will be the English electro-technical industry. It therefore should, in order to fill up the blank from the reduced exportation to South America, seek new markets; and one of such markets, presuming sufficient enterprise on the part of the English, should be Russia. One of the hindrances to the extension of the export from England to Russia, as has been frequently shown in the Russian economic Press, has been the unwillingness of the English to give credit. Now, for Russia, which is still a country very poor in capital, sufficient credit becomes a question of first importance. For its success in Russia the German industry is undoubtedly indebted, to a large extent, to the circumstance that Germany, with the co-operation of her banks, offers Russian buyers extensive and prolonged credit. To the English merchants the German system of trading on credit was, therefore, very objectionable. Recently, however, in the English Press, ever more frequently are seen articles on this topic, and if English industry desires to sell its goods in Russia it ought to make similar concessions to those made by Germany.

Unfortunately, Russia's business people have abroad in respect to payments a very bad reputation. If, however, foreign providers were to make distinctions between various trading firms and factories, &c., in all probability their losses would be less. Most of the insolvencies in Russia fall to trading concerns, whilst insolvencies in the factories are relatively few, for in Russia large concerns prevail. For example, in Russia there are about 1,100 factories or works with the workmen exceeding 500, about 2,900 between 100 and 500, and about 2,150 with categories of 50 to 100. The risk in giving credit to the first two categories of factories and a considerable portion of the third group is very small, for it is to a very large extent made up of sound concerns, and partly of share companies with large capital. But if it becomes a question of town councils, large electric stations, and the like, then the risk of non-payment is excluded entirely. Whilst as Germany, of recent years, understood the necessity of distinguishing between giving credit to tradesmen and factory owners, and then devoted all her strength to getting into direct business relations with the Russian users of machines and technical goods, in England the direct sale by English factories of machines to the Russian consumer is hampered by a series of causes. In the first place, in English industrial circles there is a complete ignorance not only of Russian, but of many other foreign languages. In Germany even small manufacturers send out catalogues at least in three languages, and often in five or six, including Russian. In England even large houses seldom send out catalogues in foreign languages, as their chief markets happen to be countries where the English language prevails. Further, whilst the German language is pretty well known in Russian business circles, the knowledge of the English language is very rare, which excludes the possibility of, or, at all events, makes very difficult, the use of English catalogues in Russia. In such circumstances, then, English manufacturers being anxious not to incur heavy expenditure do not consider it advantageous to print a catalogue in Russian. Thanks to all this, direct export by English manufacturers is made very difficult, and they prefer to deal with foreign commission houses knowing the English language or with English exporters. Of small exporters as known in Germany, there are but few in England. There are large export houses there that can maintain a large staff of foreign correspondents.

Thanks to such intermediaries, foreign consumers do not get into close relationship with the manufacturers, and this is certainly prejudicial to business, for the manufacturer does not properly realise the special requirements of the buyer in

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AGREKAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 6d.; Canada, £1 3s. 10d. (\$5.30). To all other countries, £1 10s.

FOREIGN

AGENTS: Messrs. Atkinson & Co., Gresham Street.

AGGLEDAND N.Z.: Gordon & Gotch, Albert Street; The Mining and Engineering Review, 31a, Strand Arcade, Queen Street.

BRISBANE: Gordon & Gotch, Queen St. CHRISTCHURCH, N.Z.: Gordon & Gotch, Manchester Street.

DUNEDIN, N.Z.: Gordon & Gotch, Princess Street.

JOHANNESBURG, CAPETOWN, BLOEMFONTEIN, DURBAN, PORT ELIZABETH, &c.: Central News Agency, Ltd.

LAUNCESTON: Gordon & Gotch, Cimitiere Street.

Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, and crossed "London City and Midland Bank, Newgate Street Branch."

WELLINGTON, N.Z.: Gordon & Gotch, Cuba Street.

In those far-off days before the war, when we were discussing the respective strengths of British and Teutonic electrical manufacturing concerns, we were over and over again advised by those who are entitled to be described as leaders and experts in the industrial world that, if we were weaker than we ought to have been in certain departments, it was almost entirely due to want of organisation. We heard that statement in public speech and in private conversation; it was made in the technical and trade Press by editors and by their correspondents. Everybody seemed to be convinced that something along that line was needed, whatever other measures might be taken in our manufacturing interests. Attempts were, therefore, made to bring about that very desirable state of things when the electrical lion and the lamb would lie down together, when tangled skeins should be unravelled, when without the adoption of too harsh procedure manufacturers would sink as far as practicable their individual interests and adopt a uniform policy in matters of principle so that benefits might be secured for the whole of our national electrical industries. Nobody will say to-day that those attempts entirely failed, but for a variety of reasons they were never crowned with that measure of success for which some people hoped. They were, however, sufficiently successful to lead those interested in them to indulge in war-time in an appeal to all engineering industries to emulate their example, perhaps join hands with them, and thus pursue the same or similar good efforts in the direction of larger and more general national organisation. In the days of peace, propaganda meetings were held in some of the industrial centres, and a number of engineering firms were entered as members of one organisation. And now, while the war is at its height, others are embarking upon a somewhat similar series of propaganda meetings in provincial centres after holding two or three to create the right atmosphere in the metropolis. In addition to this, we have an elaborate Manchester proposal for roping in every engineering firm in the Kingdom, and an Institute of Industry which desires to secure the support of all branches of manufacturing. Yet further efforts are being made by others to establish organisations which are in some way or other to save the situation for us or assist us "after the war."

We profoundly hope that the cry for more efficient organisation, started long years ago and then so slightly regarded, will in these times be taken up from one end of the land to the other, and will be rewarded with a fuller measure of success. But surely nobody anticipates that every firm will be induced to join hands in an engineering organisation! There always will be a number who will desire to "gang their ain gait," and it is for them to choose. There is, however, strong ground for hoping that there will soon exist amongst us an organisation which, while it may not include everybody, and while it may have little room for those who are inclined to give only a half-hearted support to true British interests, will be able to exert such an influence as shall both make it a power in Government circles and render it capable of conducting the most thorough-going campaign in Colonial and foreign markets for the benefit of British electrical and engineering industries.

Where is that organisation to be found?

NOTICE.

IN view of the recent Increase in the Postal Charges, our Subscription Rates for Great Britain and Canada will until further notice be increased to £1 1s. 8d. and £1 3s. 10d. respectively.

We do not know what measure of success has attended the steps taken by the B.E.A.M.A. towards securing the already suggested "Federation of All Associations," which it apparently regards as being essential if the Ministry of Commerce, when we get it, is to be of the fullest service. Probably it is considered that public opinion must first be cultivated before that idea of federation can be developed. If that be so, there is no time to be lost. We may even be allowed to express a regret that steps of the kind were not taken in those early days after the outbreak of war, when we were led to suppose that the situation demanded no unusual effort. However, the present policy has been gradually developed, and as we go to press we learn that the Secretary has written a book which is shortly to appear, and in which he outlines a scheme for federation.

Very fittingly Birmingham was chosen (Manchester will not mind! Birmingham is nearer to London) as the place for the first of a series of meetings organised by the B.E.A.M.A. with the object of providing a platform for the general expression of opinion by the engineering industry on the public importance of that industry "as affecting the restoration of commercial prosperity and the maintenance of impregnable national defence after the war." It was made clear that the views expressed by those taking part in the discussion were not necessarily those of the B.E.A.M.A., that association merely undertaking the duty of organising the gathering. Now, after all that has been written and said about the war and the engineering industries, and the economic struggle that is expected to follow the war, it must not be expected that many things new or original will be spoken on such public occasions, though there are many things that have to be said over and over again if public opinion is to be formed or guided. Was it not so at the last B.E.A.M.A. meeting in London? It is not surprising, therefore, to find that many of the old things were reiterated at Birmingham. They had to be—what else was there to say? If we were to report the discussion we should have to place before our readers once more many things that we have urged for many years in regard to the measures that the engineering industries ought to take for themselves. How long is it, for instance, since we urged that, without engineers in Parliament, engineering could not have its interests properly watched over at St. Stephens? How often have we stated that our foreign rivals, whether German or trans-Atlantic, had a great advantage over us by reason of the largeness of their output? How many times has the Ministry of Commerce been shown to be a necessity if Parliament and Government departments are to be able to understand what is injurious and what is beneficial to our industries? How often has the danger of our past reliance—almost complete in certain cases—upon Germany and Austria for certain manufactures been pointed to and held up as a grave warning? How often, almost to the point of weariness, have we all seen how desirable it is that good relations between Capital and Labour should be fostered, instead of the politician being allowed to sway the public with his efforts to set class against class? Yet all of these, and a score of other matters, form perfectly legitimate subjects for discussion in connection with the present propaganda efforts.

Surely to-day hardly anybody is ignorant concerning the supreme position that engineering has occupied in assisting the cause of the Allies during the past twelve months. Will this be forgotten by the nation after the war? Or will the industry be allowed to occupy that exalted place in the councils of the State which is its due? If only the nation can be led to see that by safeguarding the best interests of the engineering industry the interests of the British Empire are being protected and strengthened, these conferences will not have been held in vain. In order

that such may be the issue a federation of organisations seems desirable, if such federation is the best or only means of keeping so serious a matter lastingly before the mind of the voting public and of the elected politicians.

By effecting a better organisation of the British engineering industries, whether along Manchester, Birmingham, or Kingsway lines, if we act in time we shall be prepared to utilise our greatly enlarged manufacturing capacity and employ both those who return from the Front to these trades, as well as the many thousands of at present partly skilled workers, who will by that time probably rank in a class of higher efficiency, adaptable to work which, though it will not be on the production of shells, will still be of an engineering or metal-working character. The opener of the discussion said that we "must make the biggest effort ever recorded in industrial reorganisation," or "we shall have the biggest national scrap-heap ever witnessed." Of course, we have to remember that the words were those of Mr. Elder, not those of the B.E.A.M.A., that they were spoken at Birmingham, and that under these circumstances they will be none the worse for being taken *cum grano salis*. Those present were informed that the great problem of the future is not a manufacturing problem but a financial one. "What we shall be short of is working capital," but if we are short thereof, our enemies will assuredly be shorter. There will be plenty of work to do, but throughout the world there will be a limitation of purchasing power. "Finance alone can open the market gates and bring together the manufacturer and the user of machinery," all of which leads us on to those very familiar points that greater financial strength can be exerted by manufacturers who act in association than by single firms who, as we say, "gang their ain gait." "Our manufacturers should exploit foreign markets; not in a spirit of mutual rivalry, but in strong combination." This is as unquestionably true as it is hoary-headed. We trust that by means of a strong organisation it may become possible to make arrangements for industrial finance within industry itself, by means of "additional institutions" such as Mr. Runciman and his rejected sub-committee advocated. That certainly seems to be more within the range of practical politics than a conversion of our present sound and prosperous banking system which has so well stood the test of the strain of world-war. It was stated at Birmingham by Mr. Dudley Docker, who presided, that firms who deserved advances from the joint stock banks got them, but he added that the facilities might be multiplied by an adaptation of the German system, which combination among our manufacturers would make possible. It will be waste of breath to continue abusing our present banking system generally—we should be more profitably employed in working out our own salvation and forming our own "additional institutions" as the result of strong co-operative manufacturing action. It would probably be desirable to secure the co-operation of the banking interests, and some writers are advocating Government pressure to attain that end. We doubt whether much is to be gained either by such advocacy or by enforced co-operation.

Gas on Trains. THE recent accident on Tyneside has once more directed public attention to the risks involved by the use of cylinders of compressed gas on railway trains, and has led to a good deal of correspondence and editorial reference in the pages of the lay Press. Unfortunately, the unshot is invariably the same—the matter drifts back into oblivion, until the recurrence of disaster stimulates public interest anew and calls forth a fresh crop of letters and articles. The difficulty at the root of the trouble is a financial one; much capital has been sunk in equipping railway trains with gas-lighting

installations, and in providing gas generating and charging stations, and the railway companies cannot see their way to abandon this expenditure and spend fresh capital on electric lighting plant. The stringency of capital that will be experienced after the war will further retard reform. That the authorities recognise the danger is clearly proved by the fact that many of the railways are installing electricity in preference to gas on all new rolling stock, but many years must elapse before the obsolescence of their existing stock brings about anything like the complete abolition of gas lighting.

An article in a financial contemporary last week quoted "an expert of over 30 years' standing," to the effect that serious accidents resulting in loss of life by the use of gas practically never occur to comparatively slow trains, the impact being insufficient to smash up the carriages and demolish the gas cylinders; hence he concludes that only in the case of expresses need provision be made to avoid such occurrences.

That so short-sighted a view should be held is somewhat extraordinary. Surely it is obvious that if a fast train crashes into a slow train, the latter being equipped with gas, the danger is just as great as if the fast train were gas-lighted—even greater; for expresses usually consist of stronger and heavier coaches than slow trains, and are less likely to suffer destruction than the lighter rolling stock employed for slow traffic.

The expert suggests that the gas cylinders should be carried only under the last carriage of a train, whence the whole train would be supplied with gas, and here, again, it is obvious that the rearmost coach of a standing train is the very one most exposed to the impact of a following train. Such arguments are too transparently fallacious to carry any weight.

Rubber.

THERE has been irregularity of movement in the crude rubber market, but prices have registered an advance on balance, the improvement in sentiment being due, to some extent, to the presence at sea of at least one German raider. The rubber trade has not forgotten the consequences of allowing the *Emden* a free hand for so long, and is highly apprehensive regarding the possible exploits of the *Moewe*. There has been a very good demand from consumers both on home trade and on export account, Russia being particularly well to the front in the latter connection. The quantities of material reaching here of late have been comparatively light, but there is a moderate premium still for deliveries this side of June, and this feature will, no doubt, become accentuated if the German raider sets to work in earnest as the *Emden* did. One of the features which have been especially pronounced in the market within the past month has been the improvement in the demand which has been experienced for the lower grades of plantation material, the result of which has been that the margin between the finer and the poorer sorts has been reduced to a considerable extent. There is hardly any improvement in the shipping position owing to the congestion at the docks, and whenever there is any little quickening in demand, prices respond immediately. Lately there has been more disposition on the part of Brazilian holders to market material, and this recently caused a very sharp break in the price of fine hard Para, but the market has since steadied.

There is no doubt that the English market is losing its importance as the world's distributing centre, for all the statistics available here and in the nearer East are indicative of the greatly increasing importance of the quantities shipped direct from there to America. An official cablegram received from Singapore gives the amount of plantation rubber exported from the Straits Settlements for the month of January as 4,443 tons, compared with 3,005 tons in December last, and 2,576 tons in the corresponding period of last year. These figures include transshipments of rubber from various places in the neighbourhood of the Straits Settlements, such as Borneo, Java, Sumatra, and the non-Federated Malay States, as well as rubber actually exported from the Colony, but do not include rubber exports from the Federated Malay States.

Trade Union Rules.

A SINGULAR example of the way in which the rules of Trade Unions are sometimes sought to be applied is to be found in the case of *Kelly v. National Society of Operative Printers*, which was fully reported in a recent number of the *Law Times Reports*. The plaintiff, a printers' assistant, was a member of the defendant society in 1913, and was employed in the machine room from 10.30 p.m. to 6.30 a.m. During the day time he worked for several hours each day for a firm of carriers, unknown to his employers at the printing office and to the officials of his society. As stated by Lord Justice Swinfen Eady in his judgment: "He is 43 years of age. He said that he did not find the work of a reel hand heavy; he has two children, and a wife who is unfortunately a cripple; and for their sake he worked as he did." On his daily activities becoming known to the society, a resolution was passed for his expulsion. The resolution purported to be made under a rule of the society enabling a branch committee to expel a member for "misconduct calculated to damage the character and reputation of the society." The act of misconduct alleged against the plaintiff was not specifically mentioned in the rules; but another Rule 29 (2) provided as to the amount of overtime which night men were allowed to work. He brought an action in the County Court and obtained a declaration that the resolution was *ultra vires* and void, and an injunction with damages for £68. The defendant appealed on the ground that the society was unlawful as being in restraint of trade, and that the action was brought on an agreement and non-enforceable by statute. The Divisional Court was divided in opinion; in the Court of Appeal, however, all three judges held that the plaintiff having been expelled under a rule which gave no power to expel, and in respect of an offence which he had never committed, was entitled to the injunction claimed. It was, however, held that he could not recover any damages; but he was allowed the costs of the entire proceedings. This decision appears to us to accord with the first principles of justice. In effect, the Union sought to alter its rules in order to meet a particular case; but it has long been a principle of English law that no club or society can alter its rules so as to expel one of its members against the wishes of the minority. It may be hoped that the lesson of this case will not be forgotten.

Engineers and Economics.

ELSEWHERE in this issue will be found the announcement that the Council of the Institution of Civil Engineers has invited a noted economist to address the members on the subject of "Industrial Development," feeling that engineers should give earnest attention to the economic issues which, after the war, must profoundly influence the future of engineering, and the industrial and commercial enterprises which are vital to its progress. We cannot too cordially welcome this indication that the Council of our leading engineering Institution is alive to the importance of this aspect of the gigantic struggle which is now in progress.

Hitherto our engineering institutions have held aloof from the great questions which have racked the nation, refusing to "dabble in politics," and ignoring the fact that politics—the art of government—is the highest interest of the citizen. Not *party* politics—for that odious profession we have nothing but contempt; they have done well to keep their hands unsoiled by such contamination, but they would do better if, without neglecting the scientific and technical aspects of their work, they would recognise the duty that is laid upon them to discuss with calmness and discernment the great political questions which properly lie within their scope. Amongst these are the industrial, economic, and commercial problems which arise from time to time, and which at the present juncture have assumed new forms, and have become of the utmost urgency. We commend the excellent example of the civil engineers to the consideration of the Council of the Institution of Electrical Engineers, which in the past has shown a regrettable disposition to stigmatise such matters as sordid and unworthy of its attention.

ELECTROMOBILE BATTERY CARS.

On the occasion of the official inauguration of the Swansea electricity department's new showrooms, a feature of particular interest was the electric saloon car in which the

THE ELECTROMOBILE CHASSIS.

Mayor, Chairman and Vice-Chairman of the Electricity Committee drove to the ceremony, it being, we understand, the first electric battery car in Wales.

This car was lent for the occasion by Messrs. Johnson and Burgess, Ltd., the Swansea representatives of Messrs. Electromobile (Leeds), Ltd., who, we understand, built the car to the special requirements of Messrs. Johnson & Burgess, Ltd.

It may be added that many refinements have been incorporated, and the vehicle is considered, both in its technical features and in appearance, an advance on American designs.

It is fitted with an "inside drive" saloon body for four persons, collapsible swivelling seats being provided for the driver and his companion; the body is painted in Vauxhall brown and black, and upholstered in Bedford cloth.

The chassis is built up of pressed steel members, and is fitted with semi-elliptical springs, and wheels with Warland rims; it has a wheel base of 7 ft. 6 in., and a tread of 4 ft. 6 in.

The electrical equipment consists of an 8-h.p. double commutator series-wound totally-enclosed motor, running at 1,600 R.P.M.; this has a direct drive on to the differential on the rear axle, through double helical machine-cut gears.

The battery slung under the chassis consists of 44 Chloride super-Exide type cells; each cell has 15 plates with wood separators, and weighs 32½ lb. only. A special feature is the large sediment space at the bottom—3½ in. instead of the usual ¾ in.—as a result of which there is no need to clean out the battery until the end of the life of the plates, instead of every thousand miles

or so. The battery has an output of 165 ampere-hours, or sufficient for 50 miles running on one charge.

The electrical control of the vehicle is by means of a combined foot pedal main switch (with magnetic blow-out) and starting resistance—the arrangement being quite novel and particularly designed to facilitate driving in traffic where frequent and sudden speed reductions are wanted. The switch-arm coupled to the pedal is normally held in the full-load position by spring tension; a partial depression of the pedal gives the equivalent of "clutch slipping" for a momentary slowing up, and a full depression of the pedal cuts off current from the main controller, which can then be moved without sparking to any desired speed notch.

The driver can, of course, move the controller to the highest speed position to commence with, and start by the pedal, but this extremely rapid acceleration is not recommended, although it can be accomplished without any perceptible jerk.

It may be added that the resistance employed is of the carbon disk compression type, consisting of Ferranti tubular resistance units.

Speeds are selected by a control handle mounted concentrically with the steering wheel, and in this connection we may mention the electric horn switch of the Seng type, also a novelty in its way. This consists of a metal ring mounted underneath and concentrically with the steering wheel; when the ring is touched by the fingers at any point the horn is immediately operated. This is a great improvement in a small but important detail, as the driver can sound the horn without moving his hand or eye from their driving positions. Further, the electric wiring is fixed in one stationary position, and does not get twisted

REAR VIEW OF CHASSIS, SHOWING ARRANGEMENT OF MOTOR, GEARING, &c.

ELECTROMOBILE DELIVERY VAN.

round the steering pillar, as is the case with a switch mounted in the usual way on an arm of the steering wheel. A polished

mahogany instrument dashboard is fitted, on which are lamp switches—for a Holophane roof light, a rear lamp, and two head and two side lamps—a flush Stewart speedometer, a flush Stewart rim-winding clock, the latest pattern Weston volt-ammeter incorporating a miniature electric lamp and a Sangamo ampere-hour meter of the differential shunt type with a reversible pointer and automatic cut-off, for disconnecting the circuit when the battery is fully charged without the necessity of an attendant standing by to switch off.

It should be mentioned that ball bearings are fitted throughout. Three brakes are fitted, operated by foot, hand and electrically, by using the motor as a dynamo short circuited through a resistance. Sufficient has been said to indicate that the Swansea car lacks nothing in up-to-date equipment; in normal running, it may be added, that it operates on $\frac{1}{2}$ to $\frac{3}{4}$ unit per mile.

Through the courtesy of the makers, Messrs. Electromobile (Leeds), Ltd., we are able to illustrate a delivery van which they supplied to Messrs. Greenwood & Batley, of Leeds, last year. This has a light canvas-covered body, and carries 12 to 15 cwt. of goods, the speed being from 13 to 14 miles an hour. This vehicle was originally intended for carrying between different local works, representing very short journeys indeed, but its handiness was so apparent, that its radius of action has now been extended to places seven or eight miles distant.

The general constructional features of the Electromobile chassis will be gathered from the early part of this article and from the views of the chassis; the delivery van is equipped with an 11-plate type "Exide" 40-cell battery, giving 40 miles' travel on one charge, and with electrical control similar to that already mentioned.

ELECTRICAL TRADE AFTER THE WAR.

At a recent meeting of the BRITISH WESTINGHOUSE CLUB, Mr. G. H. NELSON, A.M.I.E.E., assistant superintendent of the Electrical Machines Department, read a paper on the advancement of British electrical industry after the war. He prefaced his remarks by a reference to the fact that the United States had realised the necessity of taking immediate steps to obtain a large share of the trade of the world, and was spending money freely on research work. The first thing for us to do was to win the war, and each one might help towards this end by making economies in living, avoiding imported luxuries, limiting as far as possible all necessities that came from neutral States, and investing the money saved in war loans. In business every effort should be made to produce as quickly as possible, at a minimum cost, all the requirements for running the war, and to employ men intelligible for the firing line.

The "Business as usual" campaign had been a mistake; our policy should have been to prosecute the war to a successful issue without delay. However, that phase had passed, and the German commercial section considered that the military party had made a great mistake, for nearly half Germany's export trade before the war was with this country and our Allies. Many weaknesses must be eliminated from our manufacturing and selling methods before we could even get level with Germany in many of our industries. Our enemies were already preparing for the problems of peace. Our exports at present made a good showing in pounds sterling, but a great deal of these would go to help win the war, and would not serve to develop our export trade. America and Japan were establishing their export trade while we were unable to compete, and no time should be lost in making preparations for the future.

The author gave a mass of statistics with regard to German electrical trade, showing that in the period 1907-1911 the number of concerns increased 41 per cent., and the number of hands employed 80 per cent.; the total earnings of employees increased 73 per cent., and the wages per employed 3½ per cent. No other industry showed so great a development. German electrical exports were valued at 7.7 millions sterling, ours at only *3.1 millions, and their electrical goods were sound and of high efficiency; they had established themselves in countries, such as Russia and Spain, where we competed with them on equal terms, and did more than their share of the trade with our Colonies. The white population of the British Empire was slightly less than that of Germany, but we had a total population of 400 millions, which should afford us an immense scope for trade, in addition to that with foreign countries.

The great progress of the Germans in commerce was ascribed by the author to careful manufacturing organisation

and research work; technical education; selling organisation; their banking system; and import duties which secured to them their home markets.

Manufacturing organisation dealt with factory expenses and the design of products. As regarded factory expenses, the Germans ran their works night and day, and this had an important bearing on the subject. Factory expenses were made up of rents, rates, taxes, maintenance and depreciation of buildings and machinery, power, light, engineering, draughting, management, purchasing and accounting expenses, salaries of foremen and charge hands, and miscellaneous shop labour. Productive expenses, on the other hand, represented the cost of the workmen's time.

The selling price of an article was made up of the cost of material and labour (which could be easily determined), share of factory expenses and of selling expenses, which were not easily arrived at, and profit. The author showed that where an annual output of 1,000 motors would bring in a profit, a reduction of output by 50 per cent. would probably show a heavy loss, due to the fact that factory and selling expenses did not diminish correspondingly; further, if the output were doubled by working day and night, the profit would be very greatly increased. Hence, keeping down the factory expenses per article and securing the maximum output were considerations of the first importance. He declared that night working paid handsomely in the electrical industry, which carried such large overhead charges—but it was essential to success that the night shift should be run on the same lines as the day shift as regarded facilities for getting the work done. Moreover, the extra output could be profitably sold at reduced prices, thus enabling the makers to establish themselves in foreign markets. The greater proportion of repetition work with larger output also enabled the costs of production to be reduced.

The importance of good design had been fully appreciated by the Germans, who gave great attention to this subject. The most important question was—what did the customers want? Information under this head could be obtained from the selling organisation and erecting staff; these should keep accurate records of the machines sold, their load and speed, the nature of their work, and the conditions of running. The German was not content to rely on the ideas of one man in getting out, say, a new motor; he collected all the available information, including particulars of competing machines, the results of scientific investigations, the views of the heads of departments, and so on, and from this combination evolved a motor better than that of any competitor. It embodied the best of these men's ideas and experience, and the results of an enormous amount of research work on materials to aid the designer to secure the maximum output for minimum weight. The co-operation of all departments of the factory in this work was of the greatest importance. In this country there was not the slightest doubt that designs generally were not tackled on a thorough basis, and in consequence many designs were developed that the salesman could not sell or the shopman build.

The author gave some comparisons between British and German motors. The shafts of the latter had fewer diameters than those of the former. A 2-h.p. machine of German make had a main coil weighing 8½ lb., and a commutating coil weighing 4½ lb.; a similar British machine had a field coil weighing only 10 lb. The German coil was nicely shaped and better impregnated. A small German motor of 130 lb. weight, running at 1,200 R.P.M., had an output of 2 h.p.; a British machine of the same weight and speed, an output of 1½ h.p. The British machine had no fan or commutating poles, and even if a fan had been fitted, the maximum output could not have been obtained without commutating poles; the German machine had both, its armature had larger slots and contained more copper—there was nearly twice as much copper in the German slot as in the British.

To bring the latter into line with the former, the makers had to fit a fan, wind the coils tighter, and get more copper on the armature. All this was done on an existing frame, but while making changes to fit a fan the machine was made so that the brackets at each end were alike. This was a point in advance of the German design, representing a saving of 15 per cent. on the building of 100 motors.

The author pointed out that an enormous amount of money was spent on experimental and research work of one kind and another, but it was not carried on in an organised fashion. He considered that there should be in London, or in some other centre, an experimental and research bureau, to which results of experiments were sent and recorded; to this bureau any firm could refer for information before commencing to carry out tests, and this information would be sent free of charge. The maintenance of this bureau should be covered by the State, as by circulating the results of research work the trade of the country must benefit. Similarly, many manufacturers should be educated to look at the matter exactly in the same way, namely, that by publishing the results of their researches they were benefiting the trade of the country, and, therefore, they personally must be benefiting in a proportionate degree.

Much of our own business was snatched from under our noses. For example, the Buenos Aires tramway undertaking was started by British capital, and electrified by German; similarly, the Victoria Falls power scheme contract went to Germany, as well as the orders of some of our great railways and corporations. Twenty years ago we practically mono-

polished the Russian market, but previously to the war we were overtaken by Germany, because with our over-conservative methods of business we were not inclined to allow long credits, we would not quote in the weights and measures of the country, nor would we quote for goods delivered at the frontier, duty paid. We should study the requirements and financial methods of the country, deal in the business methods of the country, with men who were familiar with the people, their language, and their ways, deal in the units of weight and measure of the country, and correspond in the language of the country.

The German's home trade was secured to them by protective tariffs and the patriotism of the nation. The German Government, corporations, and railways would not give an order to Britain because the British price was less than the German, even if the British firm cut the price to get in. This could not be said of British corporations. Further, some of our big industrial firms did not consider one another. A special line was got out by one of our hosiery manufacturers. The samples were sent to a leading merchant house, and the line sold well. One day a traveller from a German house came in with samples, but was told his samples were not up to the English makers' standard. The German asked for a sample of the British make, and was given one. This was sent to Germany, duplicated, and offered to the English merchant at 10 per cent. less than the British makers' price, without actually giving the figure, and the English house gave the Germans an order.

Another case happened with himself. He had put an electrical installation in one of our big industrial places, costing upwards of £10,000. On completion it was found that a certain section of the works wanted lighting, and he was asked to get out a scheme and submit a tender. This was done; the tender included the supply of three small transformers and carrying out the necessary wiring, the whole costing about £700. He received the order for wiring, but not for the transformers. The wiring was completed, and the transformers arrived and had to be installed by the purchaser. The author was sent for the day after, and the manager told him the transformers were wrong and would not give proper voltage at lighting points. When asked what that had to do with the author, he coolly replied: "Well, I took your specification from your tender, and Bergmans' supplied the transformers on that specification."

Mr. Nelson concluded by remarking that we were a race that suffered from inertia, but, like all bodies that had big inertia, we should show that when we got on the move we took a lot of stopping. We should start by stirring up patriotism for our own products instead of installing foreign-made goods, and by adapting the German "ten commandments," which urged the reader in all things to study German interests, to our own case by substituting England for Germany.

AN ENCLOSED CADMIUM-VAPOUR ARC LAMP.

The following particulars of this new lamp are taken from the paper read before the PHYSICAL SOCIETY by Dr. H. J. S. SAND:—Lowry and Abram give an account of an enclosed cadmium-arc lamp designed to supply the cadmium lines only; the employment of this lamp was, however, not very convenient, as it had to be left permanently connected with an air pump. It was started by an electric spark and was run at a low temperature, being water-jacketed, but, even so, its life was not long.

The lamp which the author has constructed is run at a fairly high temperature, the metal being melted by means of a Bunsen burner before starting, so that the arc may be struck by tilting; and the temperature of the lamp is maintained high enough to keep the metal in a molten condition and to prevent condensation of metal vapour on the glass.

The principal difficulties to be overcome consisted in the removal of dissolved gases and oxide from the metal and in preventing it from adhering to the glass, which would lead to fracture of the lamp on heating and cooling. As the lamp is constructed of quartz glass, there was also the difficulty of obtaining an efficient vacuum-tight seal for the leading-in wires, but this difficulty was overcome in a perfectly satisfactory manner by the lead seals described about two years ago.*

The oxide and dissolved gases are removed by subjecting the metal to a process of filtration in a vacuum during introduction into the lamp. The adherence to the glass, which would be very great in the case of a metal freed from its coating of solid oxide, is overcome by introducing into the lamp a small amount of a fine powder which spreads itself out over the surface of the metal. The powder chosen for this purpose was always zirconia, obtained by igniting zirconium nitrate.

Fig. 1 shows the general appearance of the lamp. It consists of a quartz tube bent into an inverted U in such a

manner as to give rise to a short cathode chamber A and a long anode chamber B. Each of these chambers is continued in a leg consisting of a thick-walled capillary through which a tungsten wire passes, the lead seals *s, s* being fitted at the ends of the legs. After the lamp has been carefully exhausted the metal is melted and allowed to run in. During this process it is freed not only from oxide but also very largely from dissolved gases. If desired, the metal may be further boiled while the lamp is still at the pump. The lamp is started by heating with a Bunsen burner from the top until the metal is well molten. When started from the cold it usually lights up even before tilting. It is usually run on a lighting circuit of 100 or 200 volts with a back resistance adjusted to take a current of 5 to 7 amperes on short-circuit.

FIG. 1.—CADMIUM-VAPOUR ARC LAMP.

The voltage on the terminals of the lamp is low, usually about 30. Owing to the fact that the small upper chamber holds the cathode, metal distils into it from the hotter lower anode chamber, and drips back again once every two or three minutes, causing a slight flicker, which does not, however, interfere with the use of the lamp. It is advisable after use to remove the metal from the bend of the tube, as it would probably otherwise set up strains on solidification which might lead to fracture of the glass. The lamp may be kept burning for an indefinite time, and yields a powerful light for optical purposes.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Trade Discounts.

With reference to the meeting of the Motor Traders' Association, held at Leeds, the report of which was given in your issue of February 4th, I was certainly under the impression that if an electrical engineer was asked to fit a dynamo to a motor car he was entitled to trade discount from the manufacturers of the dynamo, as if this cannot be called work appertaining to an electrical engineer I shall be glad to know what can be; and an electrical engineer might with equal justification be refused trade discount on lamps used for motor-car headlights, or accumulators used for ignition or lighting purposes.

It might not be out of place to give my own experience regarding this. Some little time ago, having two orders from customers to fit dynamos to their cars, I inquired from one of the leading manufacturers of these articles regarding the cost, but was informed they could only be sold on the same terms to me as to the rest of the general public. I did not bother any further with this particular firm, but purchased them from another firm which was certainly more business-like, and at the time I made no remark whatever, owing to pressure of work.

I note, however, that the meeting eventually decided that electrical engineers are entitled to trade terms for articles like this, and I should hardly imagine it would require a Solomon to come to a decision of this sort. The motor traders seem to be a very highly favoured set of individuals, as they are enabled to purchase anything in the electrical trade at trade terms, and, apparently, there is no discussion about it. Further than this, it appears from the correspondence I frequently get that almost everybody is entitled to obtain electrical goods at trade terms. For instance, from my experience over a period of about two months, the following persons have stated that they can get trade discount on everything electrical that is made, through their works:—A leather merchant, wholesale clothier, draper, and grocer, and I should imagine, if one were able to go into it, almost every trade under the sun. Surely it is time, if the motor traders can make their trade such a close corporation that they even have to hold discussion as to whether electrical engineers should purchase a dynamo at trade terms, it is about time the electrical engineers retaliated by forming themselves into a similar combine to protect their interests; such a combination is, apparently, not unusual, as it is well known

* ELECTRICAL REVIEW, February 27th, 1914, p. 355, and May 22nd, 1914, p. 357.

that plumbers have had an association of this kind for a long while.

One of the chief things in the electrical trade is the extraordinary number of so-called factors, and I cannot possibly see what use these are at all, as the wholesale firms seem to have sufficient representatives to sell their goods without anyone else intervening at all. Personally speaking, I do not know that I deal with factors, but I do know that factors make a point of calling at mills, and even at country houses where the electric light installation is looked after by a gardener; under these conditions the factors claim them to be considered as keeping their own engineer, and consequently they allow them the trade discount off everything, and the electrical contractors have to look on and say nothing.

The Electrical Contractors' Association is an association formed for quite a different purpose altogether, being mainly concerned about the question of the rights of corporations trenching on their legitimate business. Various ideas have been brought forward to enlarge the scope of the Contractors' Association, and try and make this more popular with the whole of the electrical contractors of the country, but nothing ever seems to have been done in any way to make this such a powerful organisation that the manufacturers and factors dare not keep on trading as they now do.

It certainly does not seem quite right that almost every other business in the country should be confined to its own particular trade customers, and yet the electrical business seems to be the one where any person who likes to go and ask for trade terms gets them. In some cases I have found that large engineering firms might be legitimately entitled to purchase at trade terms, seeing they keep their own men to carry out additions to their installation work; yet it does not seem to stop at this, and I have a case in mind now where, in addition to their purchasing at trade terms for the private houses of their partners, they even go further than this and purchase at trade terms for their churches and chapels. I also understand that the same thing applies to their managers and everybody else in their office on the same lines. I do not think that this can be in any way considered trading fairly, as if wholesale people consider they can deal with the electrical situation by means of factors, then there is no need at all for the electrical contractor, and he might just as well be out of business altogether.

Consulting engineers do not in any way assist the movement for fair trading regarding electrical contractors, as it has got to be common custom in the case of country-house installations for a consulting engineer to send out the wiring specification to the electrical contractor, and the engine specification to engine builders, and so on, whereas if the electrical contractors had some combination they would say they must have all or nothing, which is the answer that every consulting engineer gets from my place.

There is room for the Electrical Contractors' Association to extend the scope of their operations, as I am satisfied that they could make themselves into a very powerful factor to regulate the manner in which trade discounts are allowed, whereas at the present time complaints come before the E.C.A. at their different sections, and the usual end of it is that the firm in question is reprimanded, but whether the contractor gets any satisfaction out of it I do not know. I certainly think that the work that has been done by the secretary and executive of the E.C.A. reflects the greatest credit on them, but I have never yet heard any proposals made to force a limitation of trade discounts, simply because, as a fighting force, the E.C.A. does not exist, except on the lines of fighting for the question of trade with regard to corporations.

Contractor.

February 21st, 1916.

[We quite agree with the views expressed by our correspondent with regard to trade discounts. The subject has often been discussed in our columns. It is curious, however, to note that "Contractor" is unaware of the fact that the Electrical Contractors' Association originated from correspondence on this subject in the ELECTRICAL REVIEW, and that it was formed mainly for the purpose of putting an end to the misapplication of trade discounts, direct dealing between manufacturers and the public, and similar grievances. The question of municipal trading became acute much later.—E.D.S. ELEC. REV.]

Cause of Flicker.

I have read Mr. Balsara's letter concerning the trouble he is experiencing through the cause of flicker on his D.C. generating sets, and the following might be of interest to him. A few years ago the same trouble occurred in this station on a 315-K.W. D.C. reciprocating set, and it was some time before the trouble was located. A heavier flywheel was first tried, but this did not get over the difficulty, and the trouble was finally found to be due to the interpole field. Probably the field strength under the interpole was not always in proportion to the armature current at any load, due to the iron core of the interpole being saturated.

A shunt was fixed across the main leads carrying the whole current, and this entirely did away with any sign of flicker.

W. A. Walker,

Electrical Engineer to the Kettering U.D.C.,
February 26th, 1916.

A SUCTION GAS PRODUCER USING BITUMINOUS COAL.

At a meeting of the INSTITUTION OF ENGINEERS AND SHIP-BUILDERS IN SCOTLAND on January 25th, Mr. R. V. FARNHAM read a paper on this subject, the data for which had been obtained from producers of 100, 250, and 500 B.H.P. All of these were supplying gas to electric power generating plant.

Fig. 1 shows the 100-B.H.P. size in section. A is the space into which the coal is fed through the door at that level. B is the chamber which contains the initial charge of gas coke. FF are the steel rams coupled to the rising grate; these rams have machine-cut teeth gearing into pinions. C is the main steam raiser. E is the sliding plate for supporting the fuel bed whilst charging the producer with coal. A 3-B.H.P. electric motor is coupled to the gearing which operates the sliding plate and the rising and falling grate. Suitable reducing gear is connected to the clutch gearing, which, in turn, carries out the four operations, viz., (1) the raising and lowering of the grate; (2) the inward and outward travel of the sliding plate.

This 100-B.H.P. producer, tested by Dr. Dugald Clerk, developed 4,824 B.H.P.-hours, in 48 hours. The grate area is 706.8 sq. in., equal to 6.6 sq. in. per B.H.P. A small cooler was fitted between the engine and the producer to cool the gas to atmospheric temperature, and was the only chamber employed in rendering the gas fit for use in the engine. Bituminous coal was used containing 34 per cent. of gas and tarry matter, and after the run no trace of tarry matter was found on the valves of the engine.

The essential features of the producer are the rising and falling grate and the sliding plate, and the chief characteristic

FIG. 1.—VERTICAL SECTION OF FARNHAM PRODUCER.

is the feeding of the coal through the firing door at the bottom of the producer.

The method of working the producer is as follows:—Ordinary gas coke is fed on to the grate when at its lowest position through the hinged door at the top of the producer. This charge of coke is brought up to the level of the gas outlet. The engine is allowed to run from one to two hours, according to the load, with gas which is generated from this coke only. As soon as it is necessary to begin to charge the producer with bituminous coal, the grate is raised to the level of the sliding plate, the travel of which is about 10 in. The sliding plate is now driven across the fire between the bottom of the fuel bed and the top surface of the grate. The grate is lowered to its lowest position, and the bituminous coal is then thrown through the firing-door opening on to the grate. As soon as this space is packed tightly with the coal, the sliding plate is withdrawn, allowing the incandescent fuel gradually to settle on to the fresh fuel. The firing door is now closed, and the same procedure is followed at intervals, which are determined by the load that the producer is carrying.

The pressure of the rising grate causes the fuel, which it supports, to become very dense and compact, preventing channels or cavities from forming in the fuel column, without the necessity of any poking of the fuel. This characteristic of applying pressure to the glowing mass of incandescent carbon is very important; in fact, it is the main principle of

the suction producer in question. The pores of the fuel bed being closed by this pressure, the oxygen of the air which enters the firing door, whilst charging, comes into contact with a body of fuel which is of very close formation, and the necessary reactions take place, with the result that the gas generated is the same approximately as was generated immediately before charging.

If air and steam are being drawn through the outside steam raiser (fig. 1) to the underside of the grate immediately before charging, and the percentage of hydrogen (H_2) is from 12 to 20 per cent., and the calorific value is from 120 to 140 B.T.U. per cubic foot of gas generated, then a similar quantity of hydrogen (H_2) must be present in the gas which is being generated while the firing door is wide open. Thus hydrogen content is obtained whilst the operation of charging is going on, by simply damping the coal with water before it is introduced into the producer.

After the firing door is closed and the sliding plate withdrawn, it is most important to bring the fresh charge of fuel to a temperature that will prevent the regular supply of steam from condensing, and as quickly as possible, because the first object the steam comes into contact with, on entering the space under the grate, is cold and wet coal. This would, naturally, condense the steam flow, and the result would be that the gas would be minus its hydrogen content.

The raising of the fresh charge of coal to a temperature that will prevent condensation is carried out by pre-heating the air by means of an iron casing bolted to the top cover of the producer. The air entering the casing on one side of the cover is distributed over the entire surface of the producer

obviated by the use of electrically-welded joints, which bring the circulating water to within $\frac{1}{8}$ in. of the extreme end of the plate.

In the largest size (500 B.H.P.) a resistance is fitted in the main drum controller which regulates the speed of the motor in such a way that the plates are *withdrawn* at a reduced speed, allowing the inward travel of the plate and the raising and lowering of the grate to remain the same as in the other sizes.

In fig. 1 it will be seen that the main steam supply is obtained from the ribbed gas-main, which is surrounded by a cast-iron casing, through which the air, after leaving the pre-heater, is drawn on its way to the grate. This steam can only be generated when the gases, leaving the top of the producer, are hot enough. As the producer is started on the initial charge of coke, the gases generated before the first charge of bituminous coal is introduced would not reach the necessary temperature to raise enough steam to bring the calorific value of the gas up to the normal, and at the same time keep down the temperature of the fire.

A supplementary steam raiser has been designed in the form of a very fine jet of water distributed over the surface of the underside of the grate and the surrounding cast-iron grate guide, as well as the cast-iron bottom of the producer itself. When the gas has reached a temperature sufficiently high that steam can be raised by the gas main, the jet is dispensed with.

The regulation of the admission of steam to the fire is of the utmost importance when anthracite or coke is being gasified, but it is not so important when gasifying bituminous

FIGS. 2 AND 3.—FARNHAM GAS PRODUCER FOR BITUMINOUS COAL.

top cover, and discharges through a pipe bolted to the outside steam raiser. This arrangement is clearly seen in figs. 2 and 3. The temperature of the air is as high as 350 deg. F. when it first comes into contact with the water flowing round the rings of the steam raiser itself, and, consequently, it enters the space under the grate slightly cooler than this.

Indicator diagrams demonstrate the regularity of the gas value whilst the operation of charging the producer is carried out.

While minor mechanical and gasification difficulties were met with and overcome in the 100-B.H.P. size, it was not until the larger sizes were made that very real difficulties began to assert themselves. The smallest size, that of 100-B.H.P. capacity, had a grate area of only 4.9 sq. ft., or 2 ft. 6 in. diameter, and no trouble was met with in employing an ordinary steel sliding plate $\frac{3}{4}$ in. thick.

When the diameter of the grate was increased to 3 ft. 9 $\frac{1}{2}$ in. (250 B.H.P.) and 5 ft. 10 in. (500 B.H.P.) the plain steel plate was found to be unworkable. In the 250-B.H.P. producer a single water-cooled plate is used, and is clearly shown in figs. 2 and 3; in the 500-B.H.P. case two water-cooled plates are employed, both plates working towards the centre of the fire.

Though these water-cooled plates were subjected to a pressure test of 50 lb. per sq. in. before using them, after a few weeks' work the plates began to fail; the front end had a bevelled edge of about 3 in. width, and this bevelled edge would always split, due to the circulating water not reaching the extreme end of the plate. This trouble has been entirely

overcome by the use of electrically-welded joints, which bring the circulating water to within $\frac{1}{8}$ in. of the extreme end of the plate.

From 25 samples the average hydrogen content was only 10.29 per cent., but the average calorific value of the same 25 samples was 143.16 B.T.U. per cubic foot (higher value).

Various classes of bituminous coal are being gasified most successfully by the producer under review; the upward pressure of the rising grate causing the fuel to become thoroughly homogeneous renders caking coal just as suitable as the non-caking variety. Small coal has been found more suitable than large coal. Coal containing a high percentage of ash curtails the period that the producer can work without a complete clean out.

The most important feature of the Farnham producer is the entire absence of cleaning plant of any description, the only auxiliary chamber to the producer itself being the cooler.

Though the temperature of the gas before entering the cooler is high, it is absolutely free from any tarry matter, and when the gas leaves the cooler it is at atmospheric temperature and ready for use in the engine.

Gas enters the cooler at the base, and after leaving the coke in the lower half of the chamber, comes into contact with a very fine gauze screen, which can be rotated from the outside by means of a chain and pulley. This screen prevents any soot leaving the chamber, as jets of water play on the upper surface of the gauze, and drive the soot down-

wards into the coke immediately below. The coke itself has a separately controlled water supply.

The screen is always placed vertically until the first charge of bituminous coal is fed into the producer; by the time this is done, the coke has become hot enough to distil off any tarry matter which may have been present in the first charge of coke.

A screen working to-day has not been removed from the cooler for over one year, and the mesh of the screen is as clear as when first fitted. This mesh has 80 divisions to the square inch.

The ash content of the coal used determines the length of time the producer can generate suitable gas. With an ash content of 5.3 per cent., 148 hours' running has been obtained on a 250-B.H.P. producer without a pound of clinker being withdrawn. Of bituminous coal 12.8 tons were gasified, 22,000 B.H.P.-hours were obtained, and after the producer was cooled down about 1,200 lb. of clinker were withdrawn through the firing door.

A battery of these producers of 250 B.H.P. is now producing gas on the suction system from bituminous coal for driving gas engines of 850 B.H.P. This producer is always run out entirely after the completed period of running; no charge of bituminous coal is ever introduced during the last 10 or 12 hours' run.

Careful consumption tests with bituminous coal gasified in the Farnham producer show a net fuel consumption of 1.47 lb. per B.H.P.-hour, including all losses, week in and week out. On the 500-B.H.P. size 2.01 lb. per kW.-hour was the consumption of fuel recorded weekly, the cost ranging from 18s. to 20s. per ton, against anthracite costing from 30s. to 40s. a ton.

WAR ITEMS.

Russian Journalists and German Commercial Penetration.

—At the dinner given by the Newspaper Proprietors' Association on, February 23rd, to the Russian journalists now on a visit to this country, M. Egoroff, in replying to a toast, referred to the supreme importance of commercial relations between the Allies and Russia, and to the "penetration" policy practised by Germany. We quote the following extract from his most interesting speech from the "Times" report:—"Gentlemen, it has become an established axiom in political as well as in literary spheres that the most reliable guarantee of stable friendship between separate countries must be sought in their respective business relations. That is an idea which I, however, must accept with considerable reservations. It seems to me that the war has already introduced a very important factor. It has shown that economic relations may give place before other considerations of a more exalted order, moral and political. Let us not forget that Germany did not hesitate to declare war upon Russia, although her trade with that country ranked as one of the most important assets in German commercial prosperity. On the other hand, we have no example in history when the Russian nation entered upon a war with greater enthusiasm than now. Yet our trade with Germany was also one of the most important factors of our material welfare. What is the explanation of this apparent contradiction in terms? The answer is a simple one. There is one kind of trade which involves mutual benefit, another kind which is tantamount to a pacific conquest. Germany stood on the latter footing. In her commercial penetration into other lands she sought not only a means of self-enrichment, but a sure road to gradual conquest. She was aiming at the subjugation of the Russian people by means of her commercial and financial influences. Therein lies much food for reflection. Let us hope that our Allies, who are stronger than ourselves in the domain of industry, will not leave the German road an open one, but that they will out Germany from the Russian market and succeed in establishing a basis of just and equitable business relations with Russia. There is no other method for assuring in the future the stable development of mutual friendship which will place our countries beyond the menace of any unforeseen events."

Wood Pulp and Tramway Tickets.—The February issue of the "Journal" of the Tramways and Light Railways Association contains a copy of a communication sent to the Board of Trade on February 16th by that Association respecting the possible effects of the restriction of importation of wood pulp on the production of tramway and omnibus tickets. The Association acted on behalf of itself, the London Omnibus Owners' Federation, the British Electrical Federation, Ltd., and the Provincial Omnibus Owners' Association (Incorporated).

Aircraft Risks.—The leading departments of Glasgow T.C. have considered the advisability of insuring their respective works against aircraft risks. The Tramways Committee decided, by 14 votes to 13, against insuring, while the Electricity Committee, by 17 votes to 9, proposed to insure the generating stations at Port Dundas and St. Andrew's Cross.

Reserved Occupations and Exemptions.—The revised list of reserved occupations issued by the Board of Trade on February 2nd contained the following:—

Electrical generating stations (including those for tramways and electric railways); All classes of workmen.

Gas works: All classes of workmen inside the works.

Tramways: Traffic inspector; driver, chief storekeeper; parcel superintendent.

Mechanics, etc., in all industries: Mechanics and other similar men engaged in the maintenance and repair of plant, machinery, and tools.

The Saltburn Military Tribunal last Friday exempted for two months Mr. T. W. Hulton, assistant electrical engineer to the Cleveland Trust. It was pleaded that he was the only person left to look after underground mains, that the original staff had been reduced from five to two men, including Mr. Hulton, and that advertisements had failed to find a successor with suitable qualifications.

The Halifax Tramways and Electricity Committee has recommended that the Ministry of Munitions be asked to take over, as controlled establishments, the tramways and electricity departments of the Corporation.

The Bolton Tramways Committee has decided to make application to the Ministry of Munitions for a certificate that the supply of tramway facilities by the Corporation is of importance to carry out munition work efficiently.

At a meeting of the Military Service Act tribunal at Dorking, on February 22nd, the chief accountant of the Electricity Co. applied for exemption, and was granted two months' extension only.

At the Recruiting Tribunal at Wallsend-on-Tyne, application was made, on February 25th, for the total or temporary exemption of a tramway conductor on the Tyneside Tramways and Tramroads Co.'s system. It was stated that the company was short-handed, and that that morning they had been unable to run a workmen's car. They would either have to stop the cars or employ female conductors, but before they could employ female conductors it was necessary to make certain alterations. A postponement for one month was granted.

Application is to be made to the Ministry of Munitions by the Glasgow Tramways and Electricity Committees for a certificate making the departments controlled establishments, and permitting the municipality to that extent to come under Section 7 of the Acts which prohibits the employment elsewhere of persons who have left munitions factories.

Dearth of Machinery in Russia.—With reference to our leading article of last week, the Board of Trade "Journal" quotes a report from the British Vice-Consul at Ekaterinburg, to the effect that in Ural mining works a great dearth of machinery in general is now beginning to be very seriously felt, and fears exist as to whether allied and neutral powers will be able to replace the tremendous quantity of machinery that Germany formerly supplied to Russia. Not to mention new enterprises, the machinery which is at present in use, owing to the difficulty of obtaining spare parts, is likely to be run out, so that practically all current businesses will require new machinery after the war. The demand for catalogues and specifications in the Russian language has never been so acute as it is at the present time. Russian buyers are at a loss to find out whence to obtain prompt and reliable information as to where special requirements may be bought. Great preparations should be made by all firms anxious to share in business in the Russian market after the war. Travellers having a good knowledge of the Russian language, as well as a technical knowledge of machinery, should be sent out to the Ural mining works, where the Russians would be only too glad to give them every assistance.

An Italian Company's Difficulties.—Owing possibly to the influence on traffic exercised by the war, the Società Tramvie Vicentine is in financial straits, and a petition for its liquidation has been filed by the Banca Popolare, of Vicenza. The Society, however, last August applied for and secured the protection of the moratorium, after a court expert had reported favourably on its finances. A meeting of shareholders is to be called to decide on its future course of action. The Society was started in 1906, and works some 135 kilometres of line between Vicenza, Valdagno, Chiampo, Recoaro, Bassano and Montebelluna, and receives governmental, provincial and communal kilometre subsidies, which guarantee its bond indebtedness. Its capital is 4,000,000 lire in 100 lire shares.

After-the-War Trade.—The Council of the Birmingham Chamber of Commerce, in its annual report, expresses the hope that the Government will not fail to take such steps as may be necessary to enable the manufacturers and workers of the country to consolidate their position and enter into international competition after peace is declared without those enormous disadvantages which prevailed before the war.

It is stated that, on Tuesday next, Mr. Asquith will receive the deputation appointed at the Guildhall meeting on trade and employment after the war.

Enemy Trade Marks in Australia.—In furtherance of its policy of stamping out German influence and German trade, the Australian Commonwealth Government has suspended the trade marks of 450 articles of enemy manufacture.

Trading with the Enemy.—The "London Gazette" for February 24th contains lengthy lists of persons or bodies of enemy nationality or associations in Greece, Morocco, Netherlands, Norway, Portugal, Portuguese East Africa, Spain, and Sweden, with whom or which trading is prohibited. A number of electrical companies are included.

The Board of Trade has made Orders requiring the undermentioned businesses to be wound up:—

Calmon Asbestos and Rubber Works, Ltd., Sheppy Place, Minories, London, E. Controller: Mr. E. H. Fletcher, 14, George Street, Mansion House, E.C.

Rhenish Rubber and Celluloid Co. (1908), Ltd., Basinghall Street, E.C. Controller: Mr. J. S. Coiman, 10, Coleman Street, E.C.

Harburg and Vienna India Rubber Co., Ltd., Golden Lane, E.C. Controller: Mr. C. W. M. Kemp, 36, Wallbrook, E.C.

Manchester and Future Municipal Contracts.—The "Morning Post" states that the Manchester City Council was on Wednesday to be asked to confirm a resolution to the effect that all municipal corporations in England and Wales should have their attention called to the following standing orders which have been adopted by the City Council:—"No contract shall be entered into with any person of German or Austrian nationality; no contract shall be entered into with any firm or company whose subscribed capital, whether by way of shares or otherwise, is held or controlled to the extent of one-third or upwards by persons of German or Austrian nationality." The resolution adds that the Town Clerk be instructed to transmit a copy to the Town Clerk of each borough with a suggestion that the respective councils will take into consideration the advisability of adopting similar standing orders.

LEGAL.

ATTWELL v. WEST HAM CORPORATION.

The West Ham Corporation on February 24th unsuccessfully appealed to Justices Ridley and Avery in a King's Bench Divisional Court against a judgment at Bow County Court, where a jury awarded Mr. A. E. Attwell, an electrical engineer, £350 damages against the Corporation for personal injuries he received through the negligence of the Corporation's servants. The matter has already been reported here. The plaintiff's case was that he was working at a H.T. chamber when an explosion occurred, with the result that he was severely injured. The West Ham Corporation appealed on the ground that there was evidence of contributory negligence, but Counsel for the respondent took the preliminary objection that the appeal was out of time, and that all the grounds of appeal were inadmissible by Sec. 120 of the County Court Act. The Court upheld the preliminary objection and dismissed the appeal with costs.

MUNITIONS CASES.

At Oldham last week, the local Munitions Tribunal fined John Cox 7s. 6d. for a breach of the Act. His employers, a firm of electrical manufacturers, complained that he had attended at the works in an unfit state to work, being the worse for drink, and after being warned he repeated the offence; he later asked for his leaving certificate, which was refused, and he was told to come to the works when he was sober, but he did not return.—The Tribunal declined to grant leaving certificates to three Belgians who were employed by the same firm, and wanted to go to a place in London where they could earn more money.

A SOUTH WALES MINES CASE.

On February 25th, at Merthyr, Mr. H. Thomas, manager of Hill's Plymouth Co.'s Graig Collieries, and Mr. W. W. Green, agent to the collieries, were summoned for nine offences in respect of electrical plant. The matter is reported in the *South Wales Daily News*, from which paper we quote. Mr. Vachell of the Home Office, who prosecuted, explained that at the collieries in question—the Nos. 1 and 2 South Pits—there was a very extensive electrical plant with over 20 miles of cable and 26 motors. The plant was one of the oldest, and was getting very antiquated. In August last there was a non-fatal accident at the collieries and one of H.M. inspectors was sent to make an examination. As a result of that Mr. W. J. Charlton, the inspector, would tell the Court that the plant was "extremely neglected," and was in "a very dangerous condition." The summonses had been taken out "to illustrate various offences," but they could have taken out a hundred.

Mr. C. KENSHOLE, for the defendants, raised objection to such a remark.

Mr. W. J. CHARLTON, junior Inspector of Mines, said that when he called Mr. Thomas's attention to the condition of the cable he said he had no idea it was in such a bad state, and he quite agreed that it was unfit for use.

Mr. C. KENSHOLE: Do you know the company are gradually putting in and installing new cables throughout these collieries?—I understand they are trying to comply with the rules.

They are gradually putting in armoured cables and replacing old cables—I did see some old cables replaced.

Do you agree that to get cable now is a most difficult matter?—It would be some time before the whole could be completed.

Mr. W. W. GREEN said he had been for 12 years agent to the Hill's Plymouth Collieries, whose annual output was about 600,000 tons. He was not aware of any breach of the regulations in regard to the electrical apparatus in the mine. There was now a great difficulty in obtaining cables. The cables were from time to time damaged by falls of roof—and there were exceptionally bad roofs in these collieries, probably the worst in South Wales. The overlying strata were very weak and saturated with water. Probably these mines were the wettest in Wales, and possibly in the kingdom.

Mr. HENRY THOMAS, manager, said the company were gradually introducing new plant. The electrician had reported from time to time up to October 7th that the insulation was good. It was impracticable for witness to follow the electrician step by step to see that he was doing his duty.

The cases were adjourned until a date to be mutually agreed upon.

B.E.T.—REDUCTION OF CAPITAL.

The Court of Appeal, composed of the Master of the Rolls and Lords Justices Phillimore and Warrington, on Monday, heard an appeal by the Public Trustee as the executor of the late Leopold Salamons, the holder of £12,960 income certificates of the British Electric Traction Co., Ltd., from an order of Mr. Justice Astbury, sanctioning upon the petition of the company a reduction of its capital from £4,000,000 to £2,998,397 15s., and also sanctioning the scheme of arrangement under Sec. 120 of the Companies' Consolidation Act, 1908, so as to bind the various classes of shareholders and also the holders of income certificates issued by the company.

Mr. CLAUSON, K.C., in support of the appeal, contended that the scheme of arrangement under which the reduction of capital was effected might involve his client in some future liability.

The hearing was adjourned for a fortnight to enable the company to file further evidence.

FARRELL v. BLOXAM.

Mr. JUSTICE PIM, in the High Court, Dublin, granted an application for service of a subpoena out of the jurisdiction on Mr. A. N. Moore, formerly chief assistant electrical engineer at the Belfast electricity works, now borough electrical engineer at Newport, England, who is a necessary witness in the action for slander brought by Mr. A. B. Farrell, resident superintendent in the Belfast central station, against Mr. T. W. Bloxam, chief electrical engineer, Belfast.

ASSESSMENT OF COLLIERY POWER STATIONS.

The Divisional Court, on February 25th, granted an application by Mr. Ryde, K.C., on behalf of the Pontypridd Union against the Cambrian and other colliery companies in Glamorgan, asking for an extension of time for setting down appeals. It was stated that the cases referred to the assessment of electrical power stations at the collieries.

CONCERNING DISCOUNTS.

BY A STATION ENGINEER.

DURING recent years manufacturers have acquired the habit of sending out price lists with the most astonishing array of discounts attached. A glance through recent invoices gives the following discounts:—20, 10, 5, and 5 per cent.; 33½ and 30 per cent.; 7½, 15 and 10 per cent., plus 5 per cent. advance; 20, 7 and 10 per cent.; plus 10 per cent., less 3½. Just why makers do this kind of thing it is not easy to understand. Perhaps one reason is that buyers often add the discounts together, thinking to get an approximate result that way. Thus 20, 10, 5, and 5 per cent. sounds like about 40 per cent.; at any rate, a smart salesman will say that, and doubtless many an order has been booked on this understanding. A little thought will show that adding the figures together does not give the correct answer at all. Take this case:—20 per cent. off 100 gives 80. Then the 10 per cent. deducts 8, leaving 72. The two 5 per cents. reduce that to just under 65, so that the total effect of the discounts is only equivalent to 35 per cent., and not to 40 per cent. Similarly 33½ and 30 per cent. works out at 53½, and not at 63½ per cent. The strange assemblage of 7½, 15, and 10 per cent. looks like 32½ per cent., but it works out at 29½ per cent.

The question frequently arises, does the order in which the discounts are taken make any difference? The answer is that the order makes no difference at all. The writer has had many arguments with friends on this point, and calculations have even been produced giving the opposite result. Yet the truth of the proposition can easily be shown. Taking 20 per cent. and 10 per cent. discount off an amount is equivalent to multiplying it by .8 and .9, while taking 10 per cent. and 20 per cent. off is the same as multiplying it by .9 and .8. Obviously, the effect is the same in either case. Similarly it makes no difference whether a percentage advance in price is added before or after the discount is taken.

May one suggest that there is something silly in these elaborate discounts. Manufacturers would save so much time and labour if they quoted the equivalent figure instead of a multitude of discounts and advances, that it is hardly credible that they keep up the present method. The following accounts, copies of actual invoices, will show the waste of labour in making out accounts on the repeated discount system:—

	£4 9 6		£0 2 8
(1) Less 20 % ...	0 17 11	(2) Less 20 % ...	0 0 6
	3 11 7		0 2 2
" 10 % ...	0 7 2	" 7½ % ...	0 0 2
	3 4 5		0 2 0
" 7½ % ...	0 4 9	" 10 % ...	0 0 2
	£2 19 8		£0 1 10
	£2 10 7		£2 18 0
(3) Less 7½ % ...	0 3 9	(4) Less 25 % ...	0 14 6
	2 6 10		2 3 6
" 15 % ...	0 7 0	" 15 % ...	0 6 6
	1 19 10		1 17 0
" 10 % ...	0 4 0	" 10 % ...	0 3 8
	1 15 10		1 13 4
Plus 5 % ...	0 1 9	Plus 5 % ...	0 1 8
	£1 17 7		£1 15 0

The ideal method would be to quote the multiplier which would give the amount right off without subtraction. If we further adopt Mr. Planchon's decimalised shilling as the coinage unit, the above accounts would read thus:—

- (1) 89.50s. at 66.6 % 59.60s. (2) 2.67s. at 66.6 % 1.78s.
 (3) 50.59s. at 74.3 % 41.53s. (4) 58.00s. at 60.2 % 34.91s.

It is worthy of note that the equivalent discount does not give the same result as the repeated discounts, as errors necessarily accumulate in the latter method.

May we hope that a system capable of such perfect simplicity will ever come into use? Or are we to be put off by the conservative tendencies which form so strong a characteristic in our nation, tendencies which cause us to say that that kind of thing is all right for the benighted foreigner, but we are different? As one friend puts it, "If we had the decimal system of weights and measures and coinage, and simplified spelling, there would be nothing left for the schoolmaster to teach, and that would never do."

BUSINESS NOTES.

Board of Trade Inquiries.—The British Consul at Bordeaux reports that a local agent wishes to obtain agencies for British makers of electric lamps, for which there is a very great demand, the market having previously been inundated with German products. He says that manufacturers who wish to profit by this opportunity must be prepared to adopt the German system of sending stations to agents, the latter sending monthly statements of sales. Applications regarding the matter should be addressed to the Board of Trade Commercial Intelligence Branch in London.

The Branch has received applications from firms at home for names of makers of:—Electric switches, ironclad, and switch parts; tinned iron and steel wire; coppered steel wire.

Patent Restoration.—Mr. W. REAVELL and MESSRS. REAVELL & CO. LTD., have applied for restoration of Patent No. 17,096 of 1907, granted to them for "Improvement in mechanism for converting rotary into reciprocating motion, applicable to pumps, compressors, and other machinery."

Condensing Plant Contracts.—THE MIRRELEES WATSON CO. have recently received orders for condensing plant from a number of colliery companies, iron and steel companies, co-operative societies and others. Also a number of separate condensers and air pumps for various munition works, and for France and Russia.

Book Notices.—*How to Make a Transformer for Low Pressures.* By Prof. F. E. Austin, 11, South Park, Hanover, N.H., U.S.A. Price 40 cents in America.—This brochure should be very useful to amateurs wishing to build a small transformer for operation on lighting supply circuits, without using any costly tools, yet with the certainty of obtaining reasonably high efficiency and a reliable piece of apparatus. The data and specification clauses included should be useful also in building small transformers for laboratory use. The author gives complete instructions for making a ring-type, step-down transformer with tapplings giving various pressures down to 8 volts, when supplied at 110 volts in the primary circuit. The transformer yields 100 watts output at 90 per cent. efficiency, and may be worked temporarily at 400 watts, the efficiency being then about 70 per cent. Figs. 2 and 3 in the

booklet are capable of a good deal of improvement, but the author's meaning seems never in doubt, and any reader should be able to construct quite a satisfactory transformer from the instructions given. Among the uses to which such a transformer may be put are ringing door bells, operating small arc lamps or low-pressure tungsten lamps, performing light welding work, charging accumulators (using an electrolytic rectifier), operating small series motors, operating spark coils, and so on.

The Faraday House Journal for the Lent Term contains a portrait of Mr. C. P. Sparka, President I.E.E. and senior past-President of the Faraday House Old Students' Association, articles on the origin of the Fahrenheit scale, by Mr. G. Scott Ram, and on the Lake Coleridge (N.Z.) hydroelectric scheme, and numerous personal and other minor items, with portraits of past and present students serving with the Forces.

THE PATH PUBLISHING CO. have in preparation a book by Mr. D. N. Dunlop, A.I.E.E., entitled "British Destiny—The Principles of Progress." The author will show the philosophical basis of voluntary co-operation and its possible combination with the British policy of Individualism, while preserving the full value of the latter. A scheme for national industrial federation will be outlined.

Bankruptcy Proceedings.—A. B. CRAIG, merchant, 8, Well Street, Cripplegate, E.C., trading as John Craig & Sons.—A sitting of the London Bankruptcy Court was held on Wednesday before Mr. Registrar Hope for the public examination of this debtor, who returns total liabilities £34,292, of which £23,668 is expected to rank, against net assets valued at £25,753, or sufficient to yield a margin of £2,085, after payment of all indebtedness. The debtor had been connected with a syndicate which had promoted several companies, including the Sturgeon Falls (Canada) Electric Light and Power Co., Ltd., whose operations were brought to a standstill by litigation. A dispute had been referred to arbitration, but the arbitrator died before making his award, and the matter was still before the Courts on appeal. Witness was entitled to 1,942 \$10 shares in the Electric Co.; it had paid no dividends, but had made profits, and witness valued his shares at £15 each, or about £30,000 in all. The Official Receiver suggested that the shares were not worth a brass farthing, as they related to a concern in a small town with works in the backwoods. The debtor asserted that, on the contrary, the shares were very valuable. The examination was formally adjourned till after the next meeting of creditors.

J. WHITEHOUSE, LTD., 15, The Parade, Gilders Green, Middlesex. The following are creditors herein:—

Hands, A. C.	£171	Electrical Co.	£39
Armourer Manufacturing Co.	101	Metallic Tube Co.	19
Sloan Electrical Co.	36	Sun Electrical Co.	286
Gurney, S., & Co.	36	Regent Wall Paper Co.	36
Russell & Co.	116	Cuthbert & Harding	14
Siemens Bros.	18	Shearn, H. J., Ltd.	14

G. J. T. J. PARFITT, consulting electrical engineer, 11, Priory Road, Keynesham, Somersetshire.—An application was made at Bristol, on February 25th, for the discharge from bankruptcy of the above-named debtor. According to an amended statement of affairs prepared, the debtor's liabilities were estimated at £2,615, but would probably amount to £3,119. The assets were expected to produce nil, but realised £97 odd. A first and final dividend was paid on proofs for £2,266. The Official Receiver reported that the assets were not sufficient to pay 10s. in the £, and that the debtor had omitted to keep proper books of account. On behalf of the debtor it was stated that he had been the victim of misfortunes. The various enterprises upon which he had embarked were in connection with the business, which he had hoped to develop by means of them. He had incurred a heavy loss in connection with the Bristol International Exhibition, and the war coming after that, had simply shut down his business. His Honour said the debtor had failed to keep sufficient books to disclose his business transactions, but he would grant the discharge, subject to a suspension of two years.

Catalogues and Lists.—MESSRS. HOLOPHANE, LTD., 12, Carteret Street, Queen Anne's Gate, London, S.W.—New 84-page trade catalogue, containing illustrations of a wide range and variety of Holophane electric light fittings. Many excellent designs are given of brackets, office lighting standards, semi-indirect fittings, reflector bowl pendants, ceiling fittings, Excellence glassware pendants, sphere pendants, and electroliters with Holophane glassware. Sizes, prices, and finishes are indicated.

THE BRITISH THOMSON-HOUSTON CO., LTD., 77, Upper Thames Street, London, E.C.—New complete lamp price list (No. 1, 10, 100) of 48 pages. This is, however, not merely a price list for it contains a great deal of data and tables respecting Mazda lamp characteristics, which should be useful to those interested in such matters. Forty-nine distinct types of Mazda lamp with tungsten filaments are now listed for various voltages, wattages, &c., for all classes of service. B.T.H. carbon lamps in the standard, radiator, and decorative types are also included. Half-tone photographic views show examples of interior lighting of shops, restaurants, business premises, theatres, &c.

MESSRS. G. ST. JOHN DAY (PATENTS), LTD., Bank Mill, Morton Street, Oldham.—Illustrated pamphlet containing particulars and wiring instructions respecting the One-part lampholders and adaptors, the "Daybreak" switchholder, and the "Kombyn" insulation lampholder.

Liquidation.—RENEW ELECTRIC LAMP CO., LTD.—A meeting is called for March 29th, at 6, Old Jewry, E.C., to hear an account of the winding up from the liquidator, Mr. J. E. Perovial.

Ediswan Showrooms in Australia.—The accompanying picture shows the interior of the Melbourne showroom of the EDISON AND SWAN UNITED ELECTRIC LIGHT CO., LTD. Notwithstanding all the difficulties of shipping in these days, the company is enabled to make there a very useful collection of articles of such classes as find a sale in our Australian Colonies. The company has made a special study of the requirements of this particular market. It will be remembered that one of the directors recently made a tour of the Colonies in the company's interests, and such visits are exceedingly helpful in enabling a company to follow a line likely to fit in with the desires of our kith and kin. The stocks at Melbourne are being added to continually as new lines come along. The photograph shows such familiar lines as luminous radiators, Bastian heaters, fans, and Holophone glassware. There is not the slightest doubt that the demand for British electrical manufactures in Australia is very large at present, and the company

EDISWAN SHOWROOMS AT MELBOURNE.

has chosen the right moment for extending its activities in that market. The anti-German movement there is so strong, and writers and statesmen alike have been so thorough-going in their dealing with enemy companies, that the opportunity for our firms to do increasing trade is bound to be better than it has ever been before. Many of our electrical and allied firms already have branches in Australia, &c., and the Edison & Swan Co. has branches in Melbourne (368, Little Collins Street), Sydney (58, Clarence Street), Brisbane (32 4, Adelaide Street), and sub-agencies in Adelaide and Perth, as well as agents in seven towns in New Zealand (Wellington, Napier, Auckland, Gisborne, Christchurch, Invercargill and Dunedin), where Ediswan branded or agency goods may be obtained. The company also has its agents in Johannesburg, Malay and the Straits Settlements, and in India and Burma.

Trade Announcements.—MR. J. MARTIN BLAIR has removed to Central House, Kingsway, W.C.

The offices of the E. I. HILL ADVERTISING SERVICE have been removed to 26, Stanton Road, Wimbledon, S.W.

MESSRS. ERNEST G. DENNER & CO., electrical engineers, of Sheffield, have removed from 150, West Street, to 284, Glossop Road.

MESSRS. W. M. WILSON & CO., 19, Waterloo Street, Glasgow, have been appointed sole selling agents in Scotland for the Wells Electrical Co., London, who represent in the U.K. the Compagnie Française de Charbons pour l'Electricité.

Prices Advance.—THE BENJAMIN ELECTRIC, LTD., of Rosebery Avenue, E.C., have issued a notice respecting further advances in prices of a number of their manufactures.

For Sale.—Walsall Electricity Supply Department has for disposal two Bumstead & Chandler 250 H.P. steam engines, direct coupled to D.C. generators; one ditto 14 H.P. engine, coupled to forced draught fan; glass accumulator cells; four switchgear panels and three transformer panels. See our advertisement pages to-day.

LIGHTING AND POWER NOTES.

Aberdeen.—The engineer's monthly statement shows that during January 1,366,600 units were generated, an increase of 135,990 units, as compared with the corresponding month last year.

Argentina.—The Electric Light Co., of Mar del Plata, recently threatened to suspend the service owing to the municipality having dishonoured a promissory note in its favour for \$50,000 m/a.

The inhabitants of San Jenaro (Province of Santa Fé) are contemplating the establishment of an electric lighting service in that town.—*Review of River Plate.*

Australia.—The Bundaberg (Queensland) Gas and Coke Co., Ltd., has been authorised to supply electricity for a period of 25 years within an area in the shire of Woongarra.—*Tenders.*

Aylesbury.—L.G.B. INQUIRY.—The L.G.B. has informed the U.D.C. that an inquiry will be held into the application for sanction to a loan of £325 for electricity purposes.

Barton - on - Humber.—STREET LIGHTING.—The Council has declined to pay the electric supply company's account for the past half-year's lighting amounting to £140, as owing to the lighting restrictions the lamps have not been lit for some time. The Council offers 50 per cent. in settlement, but this the company has refused, demanding 90 per cent. and threatening proceedings. The Council has decided to ask the L.G.B. for advice on the subject, and suggested that legislation should be introduced to deal with such matters. It is interesting to note that the Clerk to the Council is also secretary to the Electric Supply Co.—*Yorkshire Post.*

Bellingham.—PROPOSED E.L. SCHEME.—The Council has approved of a proposed electric lighting scheme for the district.

Bingley.—The question of increasing the price of electricity for lighting has been deferred for 12 months.

The electrical engineer has been instructed to proceed with the wiring of the firemen's bells, in accordance with his estimate and the agreement with the Bradford Corporation as to the use of the tramway posts.

Birmingham.—RATE AID.—The Electricity Supply Committee's contribution to the rate fund, for the year ending March 31st next, is to be £25,000, as against £35,000 last year, due to the increased price of materials and labour; the Tramways Committee will contribute £50,000, as against £30,000 last year.

COAL SHORTAGE.—According to the *Morning Post*, the Corporation generating station practically ran out of coal on Monday, and as a result it was found necessary to suspend the tramway service for an hour or two, the cars being left standing in the streets pending the resumption of supply.

Blackpool.—The aggregate output of the electricity supply department during the past 10 months was 4,077,170 units, a decrease of 322,090 units, as compared with the same period last year. The effect of the lighting restrictions is shown by the great decrease during January in the amount of electricity supplied for public lighting. Last month the output under this head was only 2,000 units, compared with 15,863 units in January, 1915; 214 new consumers have been added during the last 10 months.

Bolton.—Owing to the numerous applications received for electricity for power, a Special Committee has been appointed to consider the whole question of capital expenditure with the Finance Committee.

Bradford.—The Electricity Committee has authorised an extension of mains from Apperley Bridge transformer chamber, across the bridge to the city boundary (including additions to the transformer chamber), at a cost of £400, and the sealing of an agreement for bulk supply to the Yorkshire Electric Power Co. through this extension. The Committee has approved a supplemental agreement with Messrs. Roby, Clifford & Co. and Mr. Wilfred Turner for the continuance of a bulk supply to Station Mill, Wyke. The Committee has also decided that the system at present in operation for obtaining cables from the British Insulated and Helaby Cables, Ltd., be continued for a further 12 months from April 1st next, and thereafter until further instructions are given in the matter.

Continental.—ITALY.—The Government is making efforts to extend the use of water-power for the production of electrical energy in substitution for coal, for the supplies of which Italy is entirely dependent on importation; and a decree has been issued authorising the Minister of Finance to extend concessions for the diversion of watercourses without the formality of submitting the question to technical authorities for report, provided the rights of third parties are respected.—*B. of T. Journal.*

Experiments are being made on Italian railways with electrically-driven cranes for loading coal into engine-tenders. At Florence an Italian-built crane was employed in these trials, and at Naples a crane similar to those used on Prussian railways. The cranes are mounted on trucks and are each worked by two motors. The coal is brought in small trucks holding between 500 and 750 kg., and these latter are lifted bodily and their contents emptied into the tenders. The time taken in this operation is between four and eight minutes, three men being employed, the current required being 0'08 KW.-hour per ton.—*Industria e Invenzioni.*

Dublin.—COTTAGE LIGHTING.—Reports of the Corporation Housing Committee contain estimates for the lighting of proposed working men's dwelling houses by electricity. In the North Lotts area the estimate for 201 houses (847 points) in the first section, is £1,143; second section, 245 houses (933 points), £1,259; and third section, 91 houses (387 points), £522. In the Newfoundland Street area the estimate for 125 houses (355 points) is £479; second section, 61 houses (305 points), £411; and third section (449 points), £673.

Epsom.—The U.D.C. on February 22nd decided to increase its charges for current as under:—Private houses and business premises, 7d. per unit; power, flat rate of 3d. and on the sliding scale with a minimum of 1d. for 3,000 units; public lighting, 4d. per unit.

Heston and Isleworth.—LOAN APPLICATION.—Application is to be made to the L.G.B. by the District Council for sanction to borrow £175 for mains extensions.

Huntingdon.—**REFUSE DESTROYER.**—A L.G.B. inquiry was held, on February 22nd, into the application of the T.C. for sanction to a loan of £1,800 for the provision of a refuse destructor, which, it is estimated, will effect a saving of £100 a year. There was opposition only with regard to the proposed site, but the Inspector intimated that a loan would not be granted unless the Board was convinced that the destructor was an absolute necessity.

Iford.—**NEW TARIFFS.**—The Council proposes to adopt revised tariffs for electricity supply, which will be subject to the war increase of 12½ per cent. Included are a rateable value tariff of 12½ per cent. per annum, plus 3d. a unit, flat and maximum demand rates, a sliding scale for power and special rates.

India.—**ELECTRICAL PUMPING.**—The Bangalore Municipal Commissioners have decided to electrify the pumping plant at the waterworks, for which purpose electricity is to be taken from the Cauvery Falls power station.—*Indian Engineering.*

Ipswich.—**PRICE INCREASE.**—The T.C. has increased the price of current for lighting from 4½d. to 5d. per unit, and the tariff for heating, cooking, power, &c., by 15 per cent., making 25 per cent. advance since June, 1915, while rebates in connection with the charges for supply through prepayment meters have been abolished.

Kingston-on-Thames.—The T.C. has increased the price of current supplied to the Thatched House, Richmond Park from 7½d. to 8d. per unit.

Leeds.—**PROPOSED PRICE INCREASE.**—An increase of 10 per cent. in the charges for the supply of electricity, as from March 31st to the end of March 31st, 1917, is to be proposed at the next meeting of the City Council.

Leigh.—**PROPOSED LOAN.**—The T.C. has decided to apply to the L.G.B. for sanction to the borrowing of £18,300 for extensions to the electricity undertaking; £65,713 has already been expended on the undertaking.

London.—**WOOLWICH.**—A letter has been received from the L.C.C. with regard to the B.C.'s application for a loan of £3,622 for mains, transformers, switchgear and apparatus, stating that the Finance Committee had agreed to recommend sanction to the borrowing of £3,290 only subject to Treasury approval, deducting certain expenditure which has taken place since restrictions were imposed. The Finance Committee has considered the borough electrical engineer's report as to the deficiency on the undertaking for 1914-15, and has asked for the observations of the B.C. upon the financial condition of the undertaking as disclosed by the accounts. The B.C. has decided to accept the reduced sanction, and to charge the £332 to revenue account.

The Charing Cross, West End, and City Electric Supply Co. is applying to the Board of Trade for its consent to an increase of 10 per cent. on the charges for lighting during the period of the war and for 12 months afterwards or for such period as the Board may determine.—*Standard.*

Londonderry.—According to the *Londonderry Sentinel*, held at a mayoral luncheon held last week, in the course of the speeches, it was announced that the profit on the electricity department this year would be probably £2,000. The chairman of the Lighting Committee announced that the output had increased by 21 per cent. and the revenue by over 30 per cent. in 1915, as compared with 1914. The L.G.B. had sanctioned a loan for new plant, which would result in a saving of £750 a year on coal, and enable them to increase the output by 70 per cent. Through the action of a small Committee a saving of £800 had been effected in purchasing coal recently.

Maidstone.—**PRICE REDUCTION.**—From April 1st the charge for current for heating purposes will be reduced to 1d. per unit by the T.C.

Plymouth.—**QUARTERLY RETURN.**—The return of the electricity undertaking for the quarter ended December last shows that on the Prince Rock section 1,044,834 units were sold, producing an estimated revenue of £11,136 as against 888,996 units and £9,297 in the corresponding period of the previous year. At the Newport Street works 785,089 units were sold, producing £7,469, as against 718,545 units and £6,587 in the last quarter of 1914.

Portsmouth.—The Clevedon, Portsmouth and District Electric Supply Co. has applied to the B. of T. for consent to use overhead lines at Long Ashton.

Salford.—The T.C. is making application to the L.G.B. for further sanction to borrow £2,016 to cover capital expenditure in connection with the electricity undertaking in respect of loans sanctioned by the Board prior to March 12th last. Agreements are to be entered into with four firms for the supply of current. The Electricity Committee has accepted the offer of Messrs. Maden and McKean to purchase and remove two of the existing old engine generating sets at the Frederick Road station for £2,500, also the offer of Messrs. Andrew Knowles & Sons to supply 500 tons of Trencherbone slack at 16s. 8d. per ton.

Shirley.—**PRICE INCREASE.**—In consequence of the increased prices of materials which are being paid by the electricity department, it has been decided that from April 1st next all charges for electricity for power purposes, not covered by special agreement, shall be advanced 10 per cent.

Stirling.—A further sum of £1,000 is to be borrowed for the purpose of defraying capital expenditure in connection with the electric lighting undertaking. The Corporation already possesses the necessary powers to borrow this sum.

Sunderland.—**PRICE INCREASE.**—The Electricity Committee has decided to recommend the Council to advance the charge for electricity for lighting purposes by the equivalent of a farthing per unit, commencing from April 1st.

Tasmania.—The Hobart City Council has adopted the following schedule of charges for electric power. Under Schedule A, 4s. per month per B.H.P. installed plus 1d. per unit used, with a discount of 0·4d. per unit for prompt payment; under Schedule B, 4d. per unit for the first 25 units per quarter, and 3d. per unit for all over 25 units, with a discount of 1d. per unit. Under Schedule C, the charge for connected loads of 100 H.P. up to 500 H.P., to be 4s. per month per B.H.P. installed, plus ½d. per unit used, with a discount of ½d. per unit. The chief engineer of the hydroelectric department wrote, stating that the Government proposed for the purpose of encouraging the establishment of new industries in Tasmania, to charge half the schedule rates for electric power supplied to any new enterprises for the first 18 months, and asked if the Council was prepared to make a similar concession.—*Hobart Mercury.*

Todmorden.—**PROPOSED LOAN.**—The T.C. has decided to apply for sanction to spend £2,200 on boiler plant for the electricity works.

Uruguay.—The new electric light service at Punta del Este, a seaside resort, was formally inaugurated last month.

Wimbledon.—The Electricity Committee has authorized an arrangement with Messrs. E. Brook, Ltd., for the hire-purchase of motors which might be hired to consumers in the Council's area.

The Council has approved of revised agreements for supply to the Foster Engineering Co. and Messrs. Stevenson & Sons, a coal clause being incorporated.

TRAMWAY and RAILWAY NOTES.

Australia.—A progress report by the Railway Commissioners, on the suburban railway electrification, mentions that No. 1 boiler house, with 12 boilers, stoking, ash and coal-handling appliances, are expected to be completed in a few months; a section of the condensing plant, manufactured locally, is finished, and two turbo-alternator sets are well in hand. A portion of the 20,000-volt transmission cable is in position; the Jolimont carshed is practically complete; the rolling-stock equipment is being carried out, and a commencement has been made in equipping substations. The Commissioners are unable to give any idea as to when the scheme will approach completion.

Blackpool.—It is proposed to discontinue the parcels express service on the tramway cars as from April 1st, the service, which has had 12 months' trial, not being a success.

Bradford.—As an outcome of consideration of recommendations of the Executive Council of the Municipal Tramways Association regarding the question of the indispensability of certain sections of employés on tramways, the Tramways Committee has passed a resolution: "That having regard to the severe gradients on certain sections of the Bradford tramway system the Committee deem it necessary, in the interests of public safety, that not less than one-third of the staff of male conductors be retained in the service of the department." After somewhat protracted negotiations the employés of the tramway department have accepted the offer of a war bonus equal to an increase of about 3s. a week on the old rates, but have done so under protest. The 20 women conductors are giving satisfaction, and the manager has been given authority to engage 40 more women as conductors.

Brighton Railway Electrification.—The chairman, at the recent annual meeting of the company, referred to the progress of the electrically worked suburban lines of the company, new work on which, he pointed out, had been temporarily suspended for a time, but was now being steadily carried on with a view to completing at least a part of the scheme by the time normal conditions returned.

He stated that the existing electrical services were working most satisfactorily and giving excellent results. Recent statistics showed that last year there was an increase in the number of passengers carried by those services of nearly 70 per cent. over those carried in the last years of steam traction, and since their inauguration five years ago over 40 millions more passengers had been carried by them. The increase still continued, as was demonstrated by the fact that the number carried last year was 15 per cent. higher than in 1914; this meant that there was a considerable addition to the daily suburban traffic. The contract for electrification was now in the hands of the Metropolitan Carriage and Wagon Co., and Messrs. R. W. Blackwell & Co.

Burnley.—**PLANT INAUGURATION.**—To-morrow the new 6,600-volt three-phase plant, including turbine plant and a rotary converter sub-station, installed at a cost of £26,000, is to be officially started up.

Continental.—**SPAIN.**—The small horse-tramway system uniting Irun and Fuenterrabia, 5,100 metres in length, is to be electrified. The two towns have together a population of 18,000 only, but the latter town is much frequented by foreigners in the summer season.—*Industria e Invencciones.*

Croydon.—**WAGES.**—The Tramways Committee has received a letter from the Chief Industrial Commissioner respecting an application made by the Union of Licensed Vehicle Workers in regard to wages and working conditions, asking whether the Corporation is willing to concur in the reference of the matter to arbitration. The Tramway Committee estimates that these requests would involve an additional payment in wages amounting to close on £10,000 a year. Under the circumstances, the Committee has now recommended the Corporation to inform the Commissioner that it is not willing to agree to his proposal.

Dublin.—At the annual meeting of the Dublin and South-Eastern Railway Co., Mr. P. H. Grierson suggested that negotiations be opened with the Dublin United Tramways Co., with a view to the electrification of the railway line between Dublin and Bray (Wicklow).

Glasgow.—**ELECTRIC VEHICLES.**—It is proposed that a deputation of the Cleansing Committee of the T.C. shall visit Birmingham, Sheffield and Dover for the purpose of inspecting at work the electric vehicles now in use in those towns for refuse collection, before submitting a final proposal to the T.C.

There are now 1,180 women conductors and 25 women drivers on the Corporation tramway cars.

Leeds.—**WAGES.**—The General Purposes Committee has decided not to recommend any further increase of the war bonus to tramway workers except in special cases; it has also decided not to alter the terms of employment of women conductors.

London.—The Board of Trade has extended the period for the exercise of compulsory purchase of lands, &c., under the London Electric Railway Act, 1913, by one year.

Newcastle-on-Tyne.—An extension of the Corporation tramway system to Benton was opened on Friday, last week, and a ten-minutes' service will be given. In connection with the above, a motor-bus service will run from Benton to Annitford Bridge.

North London Electrification.—Lord Rathmore, at the annual meeting of the North London Railway, stated that it was hoped by September next to work the present service between Broad Street and Kew and Richmond by means of electric trains, but probably not the more frequent service they intended ultimately to supply. The scheme forms part of the greater suburban electrification scheme of the North-Western Railway.

North Staffordshire Railway.—In the course of his speech at the annual general meeting of the above company, the chairman mentioned that the electric haulage in the Harecastle tunnel, on the company's canal system, had been working very satisfactorily indeed. The average number of boats towed by the tug was eight, and it was a question whether they would not provide a duplicate tug to ensure that traffic should not suffer from a breakdown.

South-Western Railway Electrification.—At the annual meeting of this company it was stated that the expenditure on the electrification of the suburban lines, up to the end of 1915, was £970,000. It was hoped to commence the Hounslow service early in March. Owing to the delay in the delivery of the machinery for the completion of the power house, it would probably be three or four months before the service to Hampton Court and Claygate was electrified, thus completing the present scheme. Comparing the week just prior to the opening of the "roundabout" electric service with the second week after the service commenced, there was shown an increase of 16 per cent. in the bookings.

Wolverhampton.—On Friday last, owing to the shortage of street labour, the services of the recently-formed Women's Volunteer Reserve were obtained to dig out the tramway cars which were snowed up during the previous night and day.

Spain.—The Spanish authorities have seized a secret wireless station at San Felix de Guixols, in Catalonia.—*The Times.*

United States.—The Federal District Court of New York upheld on January 7th the Atlantic Communication Co., the German-American concern operating the wireless station at Sayville, L. I., in its contention that it was not infringing upon patent rights held by the National Electric Signaling Co. The suit begun against the German company was dismissed. The National Electric Signaling Co. holds patent rights to radio inventions by Prof. B. A. Fessenden, and in his opinion Judge Mayer held that certain claims in the Fessenden patents were invalid. The Court declared that Dr. Lee de Forest had worked out the musical-toned receiver to a commercial possibility, and was operating stations in New York while Fessenden was still experimenting.—*Electrical World.*

CONTRACTS OPEN and CLOSED.

OPEN.

Aberdare.—March 11th. U.D.C. Electrical stores for 12 months. See "Official Notices" February 18th.

Australia.—**SYDNEY.**—May 1st. Two 300-kw. turbo-alternators, condensers, switchboard, &c., for the pumping station at Ryde, for the Metropolitan Board of Water Supply and Sewerage at Sydney.*

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-kw. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney.*

Barrow-in-Furness.—March 6th. Corporation. Electrical stores for 12 months. Borough Electrical Engineer.

Belfast.—March 15th. Tramways and Electricity Committee. Stores, including a number of electrical items. See "Official Notices" February 25th.

Birkenhead.—March 6th. Corporation. Cable and two rotary converters with switchgear. See "Official Notices" February 1st.

Bolton.—March 6th. Tramways Committee. Stores, including lamps, carbons, &c. See "Official Notices" Feb. 25th.

Burnley.—March 20th. Electricians' work, for the B. of G. Mr. J. S. Horn, Clerk.

Dundalk.—March 21st. U.D.C. Engine-room stores, cables, lamps, &c., for the Electricity Department. See "Official Notices" February 25th.

East Ham.—March 10th. Corporation. Twelve months' supply of engineers' sundries, for the Electric Lighting and Tramways Department. Town Clerk.

Edinburgh.—March 13th. Corporation. Structural steelwork at the new electric generating station, Portobello. Sir Alexander B. W. Kennedy, 17, Victoria Street, S.W.

Heston and Isleworth.—March 11th. U.D.C. Electrical supplies, including cables, meters, &c. See "Official Notices" February 25th.

Heywood.—March 15th. Electricity Committee. Stores, including some electrical items, for 12 months. See "Official Notices" February 25th.

Iford.—The Tramways Manager does not think it advisable to obtain tenders this year for annual supplies. He suggests obtaining one or two prices as and when articles are required and accepting the most favourable, excepting cases where the amount exceeds £50.

London.—**KENSINGTON.**—March 8th. B. of G. Six months' supply of electric fittings, lamps, &c. Clerk, Guardians' Offices, Marlborough Road, W.

L.C.C.—March 10th. Asylums and Mental Deficiency Committee. Electrical sundries. Mr. H. F. Keene, Clerk, 6, Waterloo Place, S.W.

Manchester.—March 7th. Electricity Committee. Additional tanks for feed-water softener, Stuart Street station. Chief Electrical Engineer, Dickinson Street.

Newport (Mon.).—March 4th. Corporation. Twelve months' supply of stores and materials for the Electricity Committee. Mr. A. N. Moore, Borough Electrical Engineer.

New Zealand.—**DUNEDIN.**—May 17th. City Council. (1) Tramcar bodies; (2) electrical equipment. Plans, &c., from the Town Clerk, Dunedin.*

Pontypridd.—March 13th. U.D.C. Twelve months' supply of electrical stores for the Electric Light and Tramways Department. See "Official Notices" February 18th.

TELEGRAPH and TELEPHONE NOTES.

Aeroplane for Line Repairs.—An aeroplane was employed in the restoration of telephone service destroyed by the recent floods at San Diego, Cal. It carried a rope across the flooded district, and with the rope a telephone cable was hauled through the water, thus enabling a connection to be made between the broken lines.—*T. and T. Age.*

Canada and U.S.A.—Marconi's Wireless Telegraph Co. announces that deferred plain language telegrams, night, and week-end telegrams can now again be accepted for Canada and the United States.

Salford.—March 4th. T.C. Two 1,000-KW. and one 500-KW. rotary converters and two water-tube boilers. Borough Electrical Engineer.

Spain.—The municipal authorities of Alcablas (Province of Valencia) have lately invited tenders for the concession for the electric lighting of the town during a period of 20 years.

Swansea.—March 6th. Education Committee. Electric lighting installation at Brynmill and Cwmbwila Council Schools. See "Official Notices" February 18th.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Australia.—The following tenders have been accepted :—

P.M.G.'s DEPARTMENT, SYDNEY.

200 miles of twisted-pair distributing wire, £2,300.—Western Electric Co. (Aust.), Ltd.
50 miles of rubber-insulated conductor wire, £478.—W. T. Henley's Telegraph Works Co., Ltd.

P.M.G.'s DEPARTMENT, SOUTH AUSTRALIA.

30 miles of rubber-insulated tinned-copper wire, £273.—W. T. Henley's Telegraph Works Co., Ltd.

METROPOLITAN BOARD OF WATER SUPPLY AND SEWERAGE, SYDNEY.

Centrifugal pumps and electric motors at Narrickville, £3,914.—Gibson, Battle & Co.

VICTORIAN RAILWAYS.

50-ton electric overhead travelling crane, including longitudinal conductors, for Ballarat workshops, £2,160; ditto, for Bendigo workshops, £2,160; 50-ton ditto, for Ballarat workshops, £1,576; 10-ton ditto, £292; ditto, for Bendigo workshops, £297; ditto, for Ballarat workshops, £297.—Stothert & Pitt.
Half-watt lamps, lanterns, &c.—Aust. General Electric Co., and I.R., G.P. and Telegraph Works Co., at rates. —Tenders.

Aylesbury.—U.D.C. Fuel oil (22 tons) for the electricity works : Anglo-American Oil Co., Ltd.

Bexhill-on-Sea.—T.C. Accepted tenders :—

Fan-housing for induced-draught plant at the electricity works.—Surtlevant Eng. Co., £155.
Pump.—G. & J. Weir, £82.

Bradford.—Guardians. Recommended tender : Maintenance of electrical installation at the Hospital, £15 a quarter, Mr. Chas. Bell.

Derby.—T.C. Tenders accepted :—

Two electric omnibuses, £2,266.—Edison Accumulators, Ltd.
Coal for the electricity works.—Par & Sons; Mr. T. Walker; Brookhouse, Johnson, Ltd.; Derby Coal Co., Ltd.; Hall's Collieries, Ltd.

Ilford.—The D.C. Electricity Committee is extending the present contracts for annual supplies for 12 months as follows :—

House-service fuse-boxes.—W. Lucy & Co., Ltd., 95 per cent. increase.
Junction-boxes.—W. Lucy & Co., Ltd., 4 per cent. increase or decrease with every 10 per cent. variation in the ruling price of pig-iron.
Incandescent lamps.—Cryselco, Ltd.; Electrical Mfg. & Supplies; and London and Rugby Engineering Co., Ltd., on present terms.
Meters.—Ferranti, Ltd. and Electrical Apparatus Co., Ltd., at present ruling prices as quoted. The B.T.H. Co. decline to enter into a contract for 12 months; orders will therefore be placed for their type of meter as required.

As regards house-service fuse boxes, no reply has as yet been received from J. H. Tucker & Co. as to whether they are willing to continue the contract or not.

Messrs. Foster & Co. are to supply 5,400 tons of Istocok medium peas coal at 20s. 2d. per ton, and 1,500 tons each of Istocok D 8 nuts and slack at an average price of 18s. 0d. per ton, over a period of 12 months.

Glasgow.—The Tramways Committee recommends acceptance of the following offers :—

Galvanised-steel wire.—John Stewart & Co., Ltd.
9/18 cable tire cable.—St. Helens Cable Co., Ltd.
Tubes for canopy rods.—Stewarts & Lloyds, Ltd.
Three-core cable, ozone-proof cable, and asbestos-covered wire.—B.I. and Helsby Cables, Ltd.

Liverpool.—Recommended tenders for supply of materials for the Electric Supply Department :—

Insulated cables and wires.—Liverpool Electric Cable Co.; St. Helens Cable & Rubber Co.
Electric motors.—Ferranti, Ltd.
Carbon-filament lamps.—Edison & Swan Co.
Metallic-filament lamps.—Pope's Electric Lamp Co.
Stoneware troughs, g. insulators, &c.—Mil Weston Fireclay Works; Doulton and Co.; J. & E. Bead & Co., Ltd.; Callender's Cable Co.; J. Bonne and Sons; J. Evans (Liverpool); Liverpool Building Material and Cement Co., Ltd.
Electric fittings and sundries.—Sykes & Sugden, Ltd.; British Electric Calibrated Fuse Co.
Cables and accessories for street mains.—Callender's Cable Co.
Cast iron troughs and boxes for street mains.—Whymann's Foundry Co.
Lubricating oils.—Spurrier, Glazebrook & Co., Ltd.; Vacuum Oil Co.

For the Tramways Department :—

Iron castings.—Moston Malleable Castings Co.; National Rail & Tramway Appliances Co.; Inverchangeable Brakes Block Co.; Jas. Allan, sen., and Son; John Needham & Sons.
Steel gears and pinions.—F. W. Rowlands & Co.
Lubricating oils and greases.—Vacuum Oil Co.; C. C. Wakefield & Co.

London.—ISLINGTON.—Lighting Committee. Accepted tenders for annual supplies :—

Cable terminal service and network boxes, tapes, and iron castings.—Callender's Cable Co.; Lucy & Co.; Sykes & Sugden; J. Gibb & Co.; Dussak Bismarck Co.; Henley's Tel. Works Co.; I.R., G.P. and Tel. Works Co., Ltd.
Electrical sundries, lamps, &c.—Goodman & Co.; Cryselco Co.; Edison and Swan Co.
Cables.—B.I. and Helsby Cables, Ltd.
Meters.—Chamberlain & Hookham; British Westinghouse Co.
Earthenware pipes, insulators, troughs, fire bricks, &c.—Young & Sons; Turner & Lacey, Ltd.; Knowles & Co.; Doulton & Co.
Transformers and oil tanks.—British Electric Transformer Co.; Sheep-bridge Coal & Iron Co.
Arc lamp globes.—Gordwin & Co.
Oils and lubricants.—Vacuum Oil Co., Ltd.

Manchester.—Tenders accepted by the Tramways Committee :—

J. Mackie & Son (agents for the Cornish Tin Smelting Co., Ltd.).—Block tin. Daimler Co., Ltd.—Four motor-bus chassis.

By the Electricity Committee :—

Strachan & Henshaw, Ltd.—One Telfer ash handling plant.
W. T. Glover & Co., Ltd.; Chas. Macintosh & Co., Ltd.; and B.I. and Helsby Cables, Ltd.—Supplies of cable.
Newton, Chambers & Co., Ltd.—Hot-well tank and water piping.

The E.C. has consented to the substitution of the name of the British Westinghouse Electric and Manufacturing Co., Ltd., for that of Brown, Boveri & Co., Ltd. (London), as sub-contractors for a 15,000-kw. alternator.

The Gas Committee has accepted the tender of Mr. R. Carlyle, Manchester, for the erection of a power house for electrical plant.

Midland Railway Co.—Pope's Electric Lamp Co., Ltd., has secured a renewal of its contract for the supply of "Elasta" wire lamps and carbon-filament lamps to this company.

New Zealand.—The following tenders have been accepted by the Public Works Department, Wellington :—

Transformers.—Section 53, £249, India-Rubber, G.P. and Telegraph Works Co., Ltd.; Section 54, £705, and Section 55, £272, Tolley & Sons.
Insulators.—Section 56, £474, National Electrical and Engineering Co.; Section 57, £210, and Section 58, £210, India-Rubber, G.P. and Telegraph Works Co.

Salford.—Messrs. Maden & McKee, Liverpool, are to purchase and remove two of the old generating sets at the Frederick Road station for £2,500. Messrs. Andrew Knowles and Sons are to supply 500 tons of Trencherbone slack, at 16s. 8d. per ton, delivered.

FORTHCOMING EVENTS.

Greenock Electrical Society.—Friday, March 3rd. At 7.45 p.m. at the Temperance Institute, 19, West Stewart Street. Paper on "The Life of Sir Charles Wheatstone," by Mr. A. R. Macaulay.

Saturday, March 11th. Visit to Greenock Gas Works.

Royal Institution of Great Britain.—Friday, March 3rd. At 5.30 p.m. at Albemarle Street, Piccadilly, W. Lecture on "Corona and other Forms of Electric Discharge," by Prof. Silvanus P. Thompson, F.R.S.
Saturday, March 11th. At 8 p.m. at Albemarle Street, Piccadilly, W. Lecture on "Radiations from Atoms and Electrons," by Prof. Sir J. J. Thomson.

Salford Technical and Engineering Association.—Saturday, March 4th. At 7 p.m. at the Royal Technical Institute. Paper on "Arrangement and Efficiency of Boiler Plants," by Mr. P. D. Kirkman.

Institution of Civil Engineers.—Tuesday, March 7th. At 5.30 p.m. at the Institution, 41, George Street, B.S.W. Address on "Industrial Development," by Mr. Harold Cox.

Röntgen Society.—Tuesday, March 7th. At 8.15 p.m. at the Institution of Electrical Engineers, Victoria Embankment, W.C. Discussion on "The Injurious Effects produced by X-rays." Paper on "The use of Inverse Current," by Mr. A. C. Gunstone.

Association of Engineers-in-Charge.—Wednesday, March 8th. At 8 p.m. at St. Bride's Institute, Bridge Lane, E.C. Paper on "Lubrication in Practice," by Mr. H. W. Pretty.

Royal Society of Arts.—Wednesday, March 8th. At 4.30 p.m. at John Street, Adelphi, W.C. Paper on "Optical Appliances in Warfare," by Mr. C. R. Darling.

Institution of Electrical Engineers.—Thursday, March 9th. At 8 p.m. at Victoria Embankment, W.C. Paper on "Continuous-current Railway Motors," by Mr. E. V. Pannell.

Manchester Local Section.—Wednesday, March 8th. Joint meeting with the Liverpool Engineering Society. At the Royal Institution, Colquhoun Street, Liverpool. Paper on "The Modernising of an Electric Power Supply Undertaking," by Mr. E. M. Hollingsworth.

Yorkshire Local Section.—Wednesday, March 8th. At 7 p.m. at the Philosophical Hall, Leeds. Paper on "Fire and Maintenance of Continuous-current Motors," by Mr. H. Joseph.

Manchester Association of Engineers.—Saturday, March 11th. At the Grand Hotel, Aytoun Street. Paper on "India-rubber and Balata Belting as Conveyor and Power-transmission Belts," by Mr. J. Tinto.

NOTES.

The Batti-Wallahs' Society.—In spite of the bad weather, a hundred Batti-Wallahs and their friends gathered together at the Victoria Mansions Restaurant for an informal evening on Friday last. Lieut. Haydn T. Harrison (president) was in the chair, and Mr. W. Riggs (past president) was deputy chair man. A large proportion of the assembly were clad in either blue or khaki. One of the party, Major Spittle, late of the G.W.R. electrical department, had only the previous evening returned from Flanders on short leave. One of the chief features of the programme was the Batti-Wallah Band, an original train arranged by Mr. F. J. Collis, assisted by Messrs. Ireland, Beever and Hornby.

Institution and Lecture Notes.—**PETROL, STEAM AND ELECTRIC VEHICLES.**—A paper on the above subject was read recently by Mr. G. Martin Gamble before the Yorkshire Association of Students of the Institution of Civil Engineers, at Sheffield. The author referred to the increased daily radius of motor as compared with horse transport, pointing out the saving in handling of goods by the use of the latter in preference to the railway for short distances. As regards steam traction, he mentioned that the time taken in raising steam, withdrawing or banking fires and replenishing water tanks was equal to 50-100-hour days a year.

The paper contained statistics showing comparative estimated running costs, the figures including standing charges, interest 5 per cent. per annum, depreciation and insurance, but not management and establishment charges. Thus a rubber-tired petrol wagon of 2 tons capacity, on the basis of 40 miles a day would cost 87d. per mile run; a 3-ton wagon, 40 M.P.D., 112d.; a 4-ton wagon, 40 M.P.D., 117d.; a 5-ton wagon, 40 M.P.D., 128d. A rubber-tired steam wagon of 3 tons capacity, 35 M.P.D., would cost 106d. per mile run; and a 5-ton wagon, 30 M.P.D., would cost 139d. As against these figures, the author estimates the cost of operating a 2-ton electric vehicle 30 and 50 miles per day at 101d. and 78d. per mile run respectively; a 3-ton vehicle, 45 M.P.D., at 101d.; and a 5-ton vehicle, 35 M.P.D., at 128d. per mile run.

Electric vehicle makers' estimates, comparable with the foregoing, show, for a 1½-ton vehicle, 32 M.P.D., 88d. per mile run; 2-ton vehicle, 40 M.P.D., 57d. and 51d. (two makers); 3-ton vehicle, 40 M.P.D., 713d., and 45 M.P.D., 6'69d. (two makers); 5-ton vehicle, 35 M.P.D., 9'5d., and 40 M.P.D., 8'45d. per mile run (two makers). Figures of cost per ton-mile were also given, based on the data given above. The author admits the difficulty of producing really comparative data.

Institution of Electrical Engineers.—The special general meeting of corporate members, to consider the proposed alteration of the articles of association, for the purpose of excluding alien enemy members, was held on Wednesday last; the attendance was unexpectedly large, and included many members from provincial centres. The President moved the resolution, which was seconded by Mr. C. A. Baker. An amendment extending the scope of the resolution to all members of alien enemy origin was ruled out of order, on the advice of the hon. solicitor; other questions were raised with regard to the case of naturalised aliens who had not denaturalised themselves in their native country, with regard to the possibility of giving every member an opportunity to vote by means of a postal ballot, and with regard to the permanency of the exclusion after the war. The adjournment of the meeting was also moved, but not accepted by the President, and complaints were made that the meeting was farcical if no amendments could be considered. The President, who emphatically repudiated a suggestion that the Council was pro-German, explained that any change in the articles must first receive the approval of the Board of Trade, hence the impracticability of dealing with amendments to the resolution, which had been approved by the Board. The discussion was very animated, and several members who supported the resolution intimated that if it did not apply to naturalised aliens who had omitted to become denaturalised at home they would vote against it. On the other hand, it was pointed out that if the resolution were rejected a totally erroneous impression would be created outside the Institution, as the sense of the meeting was unmistakably in favour of the exclusion of alien enemy members. Eventually it was decided that the resolution should not be put to the meeting, but that a new meeting should be called, at which the resolution and amendments could be fully considered and a satisfactory resolution formulated, which would then be submitted to the Board of Trade for approval. The session occupied about 1½ hours.

Institution of Civil Engineers.—On Tuesday next the members will receive an address on "Industrial Development," by Mr. Harold Cox. In inviting Mr. Cox to address the Institution on this subject, the Council states, it considered that the present time calls for some earnest attention on the part of engineers to the economic issues which, after the war, must influence profoundly the future of engineering, as well as the industrial and commercial enterprises which are vital to its progress, both in this country and abroad.

Association of Mining Electrical Engineers.—In the course of a paper on "Some Coal-Cutting Difficulties," read at a meeting in Glasgow of the West of Scotland Branch of the Association, Mr. H. T. Mackinnon suggested that as coal-cutters demanded intelligence and experience in their operation, machine men when first engaged should be brought to the electrical engineer-in-charge for examination as to their ability to discharge the work. Experience had shown that there was no other class of machinery more certain to yield a return for its proper maintenance or to exact so severe a penalty for its neglect than the coal-cutter of the modern type. It emphasised the necessity for standardising plugs for machines and gate-end boxes.

The Yorkshire Branch of the Association, on Saturday last, paid a visit to the Frickley Colliery, South Elmsall, by permission of the Carlton Main Colliery Co., whose engineer, Mr. H. Elliott, prepared a paper describing the colliery and its plant.

Tramways and Light Railways Association.—The Association has decided to hold its Congress on Friday, June 30th, in order not to clash with the annual Conference of the I.M.E.A., which is provisionally fixed for Thursday and Friday, June 22nd and 23rd.

Volunteer Notes.—**ENGINEERING INSTITUTIONS' V.E.C.**—Orders for week commencing March 6th, 1916.—By Lieut.-Col. C. B. Clay, V.D., Commanding.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Monday, March 6th.—Sections 1 and 2, Technical; Sections 3 and 4, Lashings and Trestle Bridging, Signalling Class and Recruits.

Tuesday, March 7th.—School of Arms, 6 to 7 p.m.

Thursday, March 9th.—Shooting for Sections 1 and 2, and Signalling Class.

Friday, March 10th.—Sections 3 and 4, Technical; Sections 1 and 2, Lashings and Trestle Bridging; Signalling Class and Recruits.

Saturday, March 11th.—Uniform Parade, 2.45 p.m.

At the Parade on Saturday, March 11th, members will parade with the 4th Batt. Central London Regiment, and will proceed by train to Woldingham, where they will be given an opportunity of inspecting the trench digging now being carried on there.

Members wishing to stay in camp on March 11th at Woldingham must give in their names at once.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, March 2nd, 1916.—

Week-end Parades.—Saturday.—The Battalion will parade at Wembley Park at 3.15 p.m. under Company Commanders.

Sunday.—First Sunday in the month.—The Battalion, less North London Platoon, will parade at Wembley Park, at 10.45 a.m. for Field Operations. The North London Platoon will be attached to the 4th Batt. Herts. Volunteer Regiment, for these operations.

Mr. W. Ridd will be in command of the Battalion for these manoeuvres. The Commandant and Adjutant are appointed Umpires.

Musketry.—There will be shooting at Bisley on Saturday next, the 4th inst. Members to Parade, in uniform, at 12.45 p.m., Waterloo Station, Platform No. 6, and to report themselves to Sergeant Cotter.

There will be no shooting at Acton.

A. G. JOINER, Major and Adjutant, O.B.C.

Appointments Vacant.—Chief assistant engineer (£200), for the Wallasey Corporation electricity department; shift engineer (£2), Borough of Rawtenstall electricity department. See our advertisement pages to-day.

Cedes Electric Traction, Ltd.—The petition of the Tador Accumulator Co., Ltd., for the winding up of this company has been allowed to stand over for a fortnight.

A 2,000-KW. Motor-Generator.—There has recently been installed at station C of the Pacific Gas and Electric Co., Oakland, Cal., a 2,000-kw. motor-generator set, consisting of an 11,000-volt, three-phase, 60-cycle synchronous motor and a 275-volt, 2,000-kw. shunt-wound, commutating-pole generator.

To carry the full-load current, which is about 8,000 amperes and provide sufficient radiating surface, the commutating field poles were wound with soft annealed copper strips wound on edge and connected in parallel. It was impracticable to use solid conductors, because a cross-section of 8 sq. in. was required. On account of the current which had to be commutated and the high peripheral speed of the commutator the bars had to be arch-bound midway between each end by three shrink rings of high tensile strength. Both ends of the commutator are bored to a slight taper and rest on similarly tapered steel rings held together by bolts. This construction allows the commutator bars to expand lengthwise when heated without distorting the shape of the commutator. On account of the length of the commutator a brush-holder yoke is placed midway of it and the brush forks are attached so that they extend towards each end. Even with this construction they are relatively long, so the forks were made of cast-iron to give rigidity and copper-plated to improve their conductivity.

All parts of the brush rigging are made comparatively heavy to absorb the small vibrations set up by the 250 brushes in the commutator. Box-type brush-holders are employed, which are split through the centre and hinged on one side, so that any holder can be removed without disturbing the others.

Each armature conductor consists of eight square wires in parallel, insulated from each other to reduce eddy current loss, which would be considerable with solid conductors of the cross-section required. The coils are insulated with mica, fish paper and cotton tape, which are hot-pressed and impregnated with an oil-proof and moisture-proof compound. D-factors are attached to the front end of the commutator and the rear ends of the armature to force air past the current-carrying parts.

Although the rotating element of the set weighs 46 tons, only two bearings are used. Each pedestal is provided with a large oil reservoir, with openings to permit the circulation of air for cooling. The bearings are ring-oiled, but to ensure an adequate supply of oil the flooding system is used. Small gear pumps, belted to the shaft, carry oil from the reservoirs in the pedestals to the tops of the bearings.

This motor-generator set, while rated at 2,000 kW., occupies a floor space of only 13½ ft. by 21 ft., which is but slightly more than the space occupied by the 1,000-kw. sets of the same speed previously installed in the same station.—*Electrical World.*

Swansea Electrical Showroom.—Through the courtesy of Mr. Burr, the borough electrical engineer, we are enabled to illustrate the palatial showroom recently opened by the Swansea Corporation electricity department. The premises which face the gas company's showrooms in the centre of the town, were originally used as a bank, and contain three large rooms, one of which—the showroom—we illustrate, while the others are used as a demonstration room and inquiry office respectively. It is proposed to hold weekly demonstrations in cooking, for which object

Photo: Chapman. SWANSEA ELECTRICAL SHOWROOM. Swansea.

two lady assistants have been engaged; the room for this purpose accommodates 60 people. As stated in a previous issue, the showroom was opened by Col. Sinclair, chairman of the Electricity Committee, who pointed out that the chief object to be attained was to demonstrate to consumers, existing and prospective, the advantages of electricity in its various applications.

Re Adnil Electric Co., Ltd.—The creditors and shareholders of the ADNIL ELECTRIC CO., LTD., Adnil Building, Artillery Lane, Bishopsgate, E.C., against which a winding up order was made in October last, met on February 29th, at the Carey Street offices of the Board of Trade, Lincoln's Inn, W.C. Mr. H. E. Burgess, Official Receiver, reported that the company was registered in 1909, and was really a revival or reconstruction of a previous concern, entitled Marples, Leach & Co., Ltd.; it was formed for the purpose of picking up that business, then in the hands of a liquidator. It appeared that Marples, Leach & Co., Ltd., had been in existence for five years, but then failed owing some £7,500 on debentures and £24,000 to unsecured creditors. The greater part of the debts were due to the Bergmann Elektrizitäts Werke, of Berlin, and under the liquidation of Marples, Leach and Co., the Bergmann Co. provided cash with which to pay off the debentures in full and to give the unsecured creditors a dividend of 7s. 9d. in the £. The Adnil Co. was then registered and purchased the stock of Marples, Leach & Co. from the liquidator. There was also some talk of a contract to purchase the goodwill of that business, and in the books of this company the Bergmann Co. was credited with £6,000 in respect of such goodwill, for the reason, apparently, that the Bergmann Co. were almost the only creditors of Marples, Leach & Co., Ltd. That sum of £6,000 was included in the present liabilities of this company, but in the absence of any contract or supporting document it could not be admitted to rank with the other debts. The nominal capital of the Adnil Co. was £10,000, divided into £1 shares; the whole of it had been issued, and with the exception of two holders of one share each the lot was held by the Bergmann Co., who accepted 7,300 shares in payment for goods supplied, and provided cash in return for the remainder. The company traded during the first two years of its existence at a small loss, but since then at a profit. During the year ended June, 1912, a profit of £638 was made, and in the following year the profit was £1,025, out of which a dividend of 5 per cent. was paid. Only a small profit was made during the year ended June, 1914.

The chairman added that this company was really an agency in England for the Bergmann Co., and it followed that, as soon as war was declared, supplies from the parent company were stopped, and no valid reason remained for the existence of the Adnil Co. The trading and business automatically stopped, but certain of the creditors intimated that they were prepared to continue operations on certain lines. Accordingly, Messrs. Marples & Leach, who had acted as managers, undertook the responsibility of the future trading, and were to take stock from the Adnil Co., and pay them one-third of the gross profits on the further trading, the other two-thirds going to Messrs. Marples & Leach respectively. The company had, however, received the whole of the profits, and Messrs. Marples & Leach had a claim in respect of their shares thereof. The winding-up order was not made against the company until October, 1915, although the petition was filed in the preceding July, and a provisional order was made for the Official Receiver to take charge of the concern and protect the assets of the company pending the hearing of the petition. Soon after that order was made, with a view to carrying on the business, and collecting the

large amount of book debts, Mr. J. H. Stephens, chartered accountant, 6, Clement's Lane, Lombard Street, E.C., was appointed special manager. He had previously been appointed, under the Trading with the Enemy Act, to supervise the business. An offer was received by Mr. Stephens from Mr. Leach to take over the stock at the price of £4,813, payable by instalments extending over two years. It followed that the liquidation must extend over that period. A statement of affairs had been drafted showing liabilities of £33,000, but from that had to be deducted the £6,000 before referred to as owing to the Bergmann Co. in respect of the goodwill, thus reducing the indebtedness to £27,000. Then, with regard to assets, Mr. Stephens had collected altogether £16,949, and after deducting necessary payments for carrying on the business, he had a balance of £12,092 now in hand. There were further book debts, amounting to £10,000, to be collected, and they were expected to fetch £4,500; there was also a balance of £4,200 to come from Mr. Leach for the stock, so that the total realisation could be estimated at £20,792, or, roughly, after deducting expenses, at £20,000, to be distributed amongst creditors for £27,000, who would probably receive rather more than 13s. 4d. in the £.

A creditor inquired whether a considerable sum was owing to alien creditors, and in the event of those claims being disregarded, the English creditors would not receive 20s. in the £.

The Official Receiver pointed out that although it was the usual custom abroad to settle with home creditors in full before taking English claims into account, the law in England provided that all creditors, whether home or abroad, should share alike. In this case the money due to German or other alien creditors would be handed over to the Public Trustee, who would hold them until the conclusion of the war.

A resolution was passed for Mr. J. H. Stephens to remain in charge of the liquidation.

Over-Run Gas-Filled Lamps in Photographic Work.

—As shown by the accompanying performance curves for gas-filled tungsten lamps, the C.P. and the actinic intensity of the light increase much faster than the power demand when the voltage across a given lamp is increased above the normal operating pressure. For instance, with a 10 per cent. increase in voltage above the rated value, the actinic intensity increases 50 per cent. Con-

PERFORMANCE OF GAS-FILLED LAMPS, SHOWING EFFECT OF VOLTAGE ON C.P. AND ACTINIC INTENSITY.

tinuous operation at such an over-voltage would decrease the lamp's life from 1,000 hours to about 300 hours, but momentary over-voltage operation may not be objectionable in portrait or motion-picture photography, as the posing may be performed at reduced intensity, and the lamp later flashed to 110 per cent. of its rated voltage only at the time of film or plate exposure.—*Electrical World.*

Supply Companies in France.—Apart from the dearth of other raw materials, the supply companies in France, which depend upon the use of coal, are seriously affected by the high price of the latter, owing to the national production being largely in enemy possession, and the enormous rise in freight rates since the outbreak of war having caused imported coal to reach an unprecedented level. At the recent meeting of the Société d'Electricité de Paris, the chairman mentioned that the company had to arrange contracts for English coal months in advance, in order to endeavour to obtain regular deliveries, that the company had to keep stocks amounting to about 30,000 tons, and that the present cost of the coal was from £2 16s. to £3 4s. per ton. Naturally, the augmentation brings about automatically a similar increase in the charges made per kw.-hour where it is possible to secure it. But it is asserted that certain supply companies are specially affected through the dearthness of coal, as their contracts with consumers are for the sale of energy at a fixed price, that is, at the same rate as prior to the war, and, as prices are already low, many supply companies are now declared to be working at a loss at the present time. This state of affairs, however, does not prevail in the case of

the Société d'Electricité de Paris, whose principal customers are the Metropolitan Railway, the Nord-Sud Railway, the Compagnie des Tramways de Paris et du Département de la Seine, and the Compagnie des Omnibus. The contracts with these customers and the large industrial consumers are arranged on a double basis. In the first place, the price is fixed according to the consumption of energy, and it is based upon the average price of coal in the previous year. Later on, when it is possible to ascertain the average prices of coal in the current year, the accounts are adjusted accordingly. In normal times the variations in the prices of coal are only slight, and the adjustments of accounts are consequently limited to sums amounting to a few thousands of francs; but at present the variations in coal prices are enormous, and the adjustments represent several millions of francs which customers will have to pay to the company. The necessity for accumulating large stocks of English coal, which has to be paid for in cash, imposes a great charge upon the financial resources, and in order to keep adequate funds in hand the date for the payment of the company's dividend for 1914-15 has been left to the discretion of the directors. In Italy, where in times of peace imported coal cost £14s. per ton, the rate rose recently to £8 per ton, but since then a slight decline has taken place. The supply companies and the tramway authorities are particularly affected detrimentally not only on account of the high price of coal, but also owing to its scarcity. Some of the tramway companies are restricting their services, whilst others will be compelled to stop working altogether if the situation is not speedily remedied. A meeting of representatives of the tramway and lighting companies has just been held, when it was decided again to impress upon the Government the urgent necessity for taking action in the matter, especially as the State is a very large purchaser of English coal for the railways and other purposes.

Engineers' Wages.—The *Manchester Guardian* states that the Joint Committee of Engineering and Kindred Trades representing the Manchester district met in Manchester on 23rd February. Mr. T. J. Holt, district secretary of the Amalgamated Society of Engineers, presented the figures of the ballot dealing with the decision of the Government Productions Committee regarding the application for an increase of wages to engineers in the district. The result showed an overwhelming majority in favour of carrying the question forward. Another application is to be made to the Manchester Engineering Employers' Federation. The original application was for a wages advance of 6s. per week. The local conference and the central conference declined to accede to the claim, and the Government Productions Committee took the same course. It is stated that an amended application is now being forwarded to the Employers' Federation, as the men are determined that the Manchester district shall be brought up to the standard of other centres. For the men it is stated:—"Hitherto we have been one of the highest-paid engineering centres in the country, but to-day we are one of the lowest. The wages of the past have drawn the cream of the craftsmen to this area, and, naturally, the prestige must be maintained. In Manchester we have only had a 3s. wages advance since the war began. Other towns have received from 5s. to 7s. of a wages advance, and others again a 4s. wages advance with a 3s. war bonus."

Inquiry.—Makers of "Metite" brushes for slip-rings are asked for.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry also electric tramway and railway officials, to keep readers of the *ELECTRICAL REVIEW* posted as to their movements.

Central Station Officials.—The following increases of salary to officials in the Manchester electricity department were to be brought before the City Council on Wednesday of this week:—

Mr. T. BAXENDALL, constructional engineer and assistant resident engineer at Stuart Street, from £270 to £300 per annum; Mr. J. R. DAVISON, boiler house superintendent, running staff, £200 to £225; Mr. H. W. SMITH, engineers-in-charge, Stuart Street, £200 to £225; Mr. W. H. WOODS, engineers-in-charge, Stuart Street, £200 to £220; Mr. W. H. SYMONS, engineers-in-charge, Stuart Street, £200 to £220; Mr. A. L. LANE, engineers-in-charge, Stuart Street, £175 to £200; Mr. I. G. THOMSON, boiler-house superintendent, repairs staff, £175 to £200; Mr. W. BAXTER, superintendent of electrical repairs at all stations and sub-stations, £156 to £170; Mr. W. KIDG, assistant constructional engineer, £163 10s. to £200.

Out of 32 applicants, five of whom were interviewed, Mr. T. E. BOOTHBY, of Wembley, Middlesex, has been appointed as charge engineer at the Southwark electricity works, at a salary of £3 a week. Mr. W. E. BUCKINGHAM has been appointed junior engineer. There were 15 applicants for this post, five being selected for interview, but two only putting in an appearance.

Mr. E. W. MARTIN, assistant distribution engineer at Woolwich, is to be promoted to the position of distribution engineer (a post formerly filled by Mr. Penning, the present deputy electrical engineer) at a commencing salary of £170 a year. It is proposed to increase Mr. Penning's salary from £215 to £250.

Mr. J. S. HOLLINRAKE, electrical engineer to Bispham-with-Norbeck U.D.C., has been appointed manager to the Weaverham Electricity Supply Co., Ltd., Cheshire.

The employees at the Kilnmeek Corporation electricity works have presented Mr. E. J. WALSH, chief assistant engi-

neer, with a purse of sovereigns on his departure to take up the duties of resident engineer to the Musselburgh Electric Light & Tramway Co. The presentation took place at a function held last Friday, presided over by Mr. Neil Clark, works superintendent, and Mr. W. E. Upton, assistant engineer.

Mr. R. W. KILTZ, assistant electrical engineer of the Wimbledon B.C., has been granted a commission as Lieutenant in the Army Ordnance Department.

General.—On Saturday evening about fifty employees and friends of the firm of G. R. MARSON gathered at the "Craven Arms" Hotel, Coventry, for a social evening at the invitation of the firm. The manager, Mr. J. MARSON, was in the chair. During the evening Mr. W. CHAYMAN, an employee of the firm for 20 years, on behalf of the other employees of the firm, presented to Mr. J. MARSON a gold watch-box for himself, a gold chain and pendant for Mrs. Marson. A musical programme followed.

The India-Rubber, Gutta-Percha & Telegraph Works Co., Ltd., of Silvertown, have lost another of their old servants in the person of Mr. ROBERT STABLES, who recently retired on account of ill-health after 43 years' service. Mr. Stables who was born in 1850, joined the India-Rubber Co. in 1873, and in two or three years was made engineer-foreman. In 1884 he was appointed manager of the rubber department, which eventually came under the control of Mr. C. H. Gray, one of the present managing directors. Mr. Stables took a great interest in local affairs, and a few years ago was elected Deputy-Mayor of West Ham. An artistic illuminated address (into which a rubber tree and the Silvertown Co.'s house flag were introduced), together with a cheque, was presented to Mr. Stables as a token of the high esteem in which he is held by his many friends at the works, at Cannon Street, and at the branches. Owing to the present state of Mr. Stables' health, two of his former colleagues, Messrs. G. Stoot and J. Hipwell made the presentation at his home at the Garden City of Letchworth, Herts., to which he recently moved.

Mr. M. A. MCLEAN, of the British Westinghouse Electric and Manufacturing Co., Ltd., Trafford Park, is serving on the Stretford Appeal Tribunal.

Amongst the candidates selected by the Council of the Royal Society to be recommended for election into the Society is Mr. S. G. BROWN.

Mr. EDWARD V. BALDWIN, for the past eight years with the Newcastle Electric Supply Co., has secured a commission in the Royal Engineers, and has joined the Electrical Section.

At St. John's Church, Chatham, on February 24th, the marriage took place of Mr. LEONARD WALLIS, of the electrical engineering staff at the shipbuilding yard of Messrs. Palmer, Newcastle-on-Tyne, and Miss Margaret T. Colman.

Mr. D. A. WALKER, draughtsman in the Wimbledon B.C. electricity department, who joined the London Scottish Regiment at the outbreak of the war, and was wounded in France, losing one of his eyes, returned to his duties in the department on January 31st, on his discharge from the Army. He has now resigned his position, having obtained another appointment.

Roll of Honour.—Second-Lieutenant R. B. DUNLOP, Royal Engineers, reported a second time wounded, was formerly in the service of Messrs. Siemens at Glasgow.

Mr. J. BAYLDON, late of the 2nd Battalion Scots Guards, electrical storekeeper at Northfleet Engineering Works, died on February 17th. He took part in much fighting until wounded at Ypres, and was invalided out of the Army.

Private ANDREW QUICK, late of the staff of the Gravesend and Northfleet Electric Tramways, Ltd., and of the 2nd Bedfordshire Regiment, has been killed in action in France.

Sergeant FRANCIS L. CATER, who was gazetted Second-Lieutenant on February 18th, returned home ill, and is in hospital at Hastings.

Second-Lieutenant E. A. F. GOODFELLOW, 3rd Connaught Rangers, who was killed on February 20th, was the only son of Mr. and Mrs. A. T. Goodfellow; he was educated at Eton and the Central Technical College, South Kensington, where he was Siemens medallist and David Salomons scholar, and obtained diplomas in electrical engineering and in civil and mechanical engineering. He graduated B.Sc. Eng. (hons.) at London University, and became assistant engineer of the Burma Railways, but came home in April last and obtained a commission. He was said to be "a tremendous worker."

Wills.—The late Colonel T. E. VICKERS (Vickers, Ltd.) left unsettled net personality amounting to £106,899.

The late Mr. THOMAS PARKER left £18,380 gross and £6,096 net personality.

The late Mr. J. H. LANE, a director of the Indian Government Telegraph Department, left £28,842 gross and £26,907 net personality.

NEW COMPANIES REGISTERED.

Baughan and Co., Ltd. (143,116).—This company was registered on February 25th, with a capital of £2,500 in £1 shares, to carry on the business of electrical, general, and consulting engineers, as formerly carried on by A. H. V. Baughan at London Street, Reading, as Baughan and Co. The subscribers (with one share each) are: G. B. Hextall, 36, King Street, Chesham; F. C. Souter; F. Sawyer, 46, Fairme Avenue, Streatham, S.W.; clerk Private company. A. H. V. Baughan is first permanent governing director. Registered office: 8 and 10, London Street, Reading.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Musselburgh and District Electric Light and Traction Co., Ltd.—A memorandum of satisfaction to the extent of £600 on December 15th, 1915, of charge dated November 13th, 1905, and May 11th, 1909, securing £90,000, has been filed.

Rugby Lamp Co., Ltd.—Issue, on January 26th, 1916, of £500 debentures, part of a series of which particulars have already been filed.

White, Jacoby and Co., Ltd. (52,494).—Capital, £4,000 in £1 shares. Return dated December 23rd, 1915, 3,207 shares taken up; £1 per share called up on 850 shares; £850 paid; £2,357 considered as paid on 2,357 shares. Mortgages and charges: Nil.

British Electrical Export Co., Ltd. (138,028).—Capital, £2,000 in £1 shares. Return dated January 5th, 1916, 103 shares taken up; £103 paid. Mortgages and charges: Nil.

City of Freetown (Sierra Leone) Electricity Co., Ltd. (138,058).—Capital, £1,000 in £5 shares. Return dated January 31st, 1916, all shares taken up; £1,000 paid. Mortgages and charges: Nil.

National Electric Engineering Co., Ltd.—Capital, £5,000 in £1 shares. Return dated January 3rd, 1916, 2,659 shares taken up; £654 paid; £3,905 considered as paid. Mortgages and charges: Nil.

Bogota Telephone Co., Ltd. (69,059).—Capital, £45,000 in £1 shares (20,000 pref. and 25,000 def.). Return dated November 26th, 1915, 18,200 pref. and 18,607 def. shares taken up; £1 per share called up on 9,200 pref. and 18,607 def. shares; £27,807 paid; £24,000 considered as paid on 9,000 pref. shares. Mortgages and charges: Nil.

Bourne End Electric Installation Co., Ltd. (98,428).—Capital, £5,000 in £1 shares. Return dated December 30th, 1915, 1,000 shares taken up; £7 paid; £993 considered as paid. Mortgages and charges: £2,000.

CITY NOTES.

French Electrical Companies.

The *Compagnie Générale Française de Tramways* proposes to pay a dividend of £1 per share for 1915, as compared with 16s. in 1914; the *Tramways de Rouen* £1 4s. per share, or 6 per cent., for 1915; and the *Tramways d'Amiens* 5 per cent., as against 4 per cent. in 1914.

The accounts of the *Société Hydro-Electrique des Basses Pyrénées* for 1914 show an increase in the receipts as compared with the preceding year, but the inconsiderable profits have not permitted of the payment of a dividend. The situation of the undertaking improved in 1915, owing to the demands for power on the part of local works engaged on the production of war materials.

The *Société Est-Lumière, of Paris*, reports that the receipts in 1914-15 experienced a decrease simultaneously with a growth in the working expenses owing to the war, and the number of new consumers, which exceeded 23,000 in 1913-14, increased by scarcely 2,000 in the past year; whilst the consumption of old customers was much less than formerly. After several years of progressive expansion, the gross receipts in 1913-14 reached £215,000, and the gross profits £89,000, the figures for the past year being £182,000 and £49,000 respectively. The net profits receded from £74,000 in 1913-14 to £29,000, but no dividend has been paid for either year, as the company is reserving its funds for the purpose of development works.

The report of the *Société d'Electricité de Paris* for the year ended with June 30th, 1915, states that the period included the first 11 months of the war, when industrial depression was the most marked, and it only experienced slightly the effects of the resumption which is growing month by month, and is tending to increase the sales of energy to the transport companies and large manufacturers in the vicinity of Paris. Under the prevailing circumstances, the works carried out at the Saint Denis station were of little importance, and no addition was made to the supplementary installations and accessories. The sales amounted to 85,510,000 kw.-hours, as contrasted with 145,213,000 kw.-hours in 1913-14, and the net profits reached £105,000, permitting of the payment of a dividend of 8 per cent., or 16s. per share.

The *Société L'Ouest-Lumière*, which made regular progress year by year down to the outbreak of the war, suffered from this event and the advance in the cost of coal and of other raw materials. While the number of new customers increased by 16,000 in 1913-14, that in the following year scarcely rose by 2,000, but the company has the good fortune of possessing in its area of supply many industries which are working for the national defence, and which are expected to be transformed after the war, especially in the case of the many new works, so as to produce articles formerly procured from Germany. The gross receipts in 1914-15 amounted to £240,000, as compared with £335,000 in the previous year, and the net profits were £65,000 and £124,000 respectively. A dividend at the rate of 2s. 9d. per share has now been declared for each of the past two years, this contrasting with 5s. 7d. per share in 1912-13.

The directors of the *Société L'Eclairage Electrique, of Paris*, report that the Lecourbe works, which was disorganised at the beginning of the war through the withdrawal of mobilised workers, was not brought to a standstill, but continued the construction of machinery and executed important deliveries

either from stock or from manufacturing. The work carried out at the cable factory at the Jarville works was the production of wire, whilst conductors and cables were made at the works in the Rue Bolivar. In the case of the Colombes works, which was closed on the opening of the war, work on copper was resumed in October, 1914, together with the production of tubes and small appliances, which were in great demand. The works in the Avenue de Choisy was very actively occupied, and received large orders for electrical plant and lathes. The net profits realised in 1914-15 amounted to £42,000, and a dividend at the rate of 5 per cent. has been declared.

Chelsea Electricity Supply Co., Ltd.

The profit for 1915 was £34,955, plus £3,111 brought forward and £2,312 for interest. After paying debenture interest and redemption fund, putting £14,720 to credit of reserve for renewals, depreciation, and contingencies, writing off £1,089 for cost of extinction of founders' shares, writing £1,000 off investments, paying 6 per cent. on the preference shares, and 4 per cent. on the ordinary for the year, £3,293 is to be carried forward, 5,564 lamps (equiv.) were added during the year, making the total 319,840. The units sold were 4,192,892, a decrease of 149,290 for the year. Annual meeting: March 8th.

Underground Electric Railways Co. of London, Ltd.

The net revenue from investments, &c., in 1915, after deducting general expenses, and including the amount brought forward, was £707,370. After paying 4½ per cent. on the bonds due 1933 and on the three-year secured notes due 1917, the surplus is £580,618. This is dealt with thus:—Payment under the guarantee on Central London Railway assented stocks, £26,931; interest at 6 per cent. on first cumulative income debenture stock due 1945, £76,380; interest at 6 per cent., plus income-tax, on 6 per cent. income bonds due 1948, £438,731, leaving £38,576. The income from investments was £680,741, as against £684,626 for 1914, a decrease of £3,884, or 57 per cent. Notwithstanding the abnormal conditions resulting from the war, the aggregate income from all sources was well maintained. Annual meeting: March 10th.

During 1915 the business of the company continued to show most satisfactory results. The net profit, after charging £11,882 for depreciation, and £2,500 for debenture interest, is £22,593, plus £7,023 brought forward. After paying the preference dividend, £9,000 is to be put to reserve, 8 per cent. (free of income-tax) is to be paid on the ordinary shares, the same as for 1914, carrying forward £6,616. The death is recorded of Mr. P. G. Wayne, a director, but the vacancy is not to be filled up at present. Annual meeting: March 15th.

Davis & Timmins, Ltd.

Sir HENRY MANCE, addressing the annual meeting on February 24th, said that the report from the financial point of view was highly satisfactory, but the results were in a great measure due to abnormal conditions due to the war. They must not expect that at the conclusion of hostilities they would immediately return to the normal state of things existing before the war. Business relations would take some time to re-adjust themselves. In regard to the Excess Profits Tax, the exact amount that they would have to pay was not yet ascertained, as no doubt the Government would require to see that the accounts were prepared in exact accordance with their views. It was, however, certain to exceed £10,000. Mr. G. E. DAVIS, the managing director, who followed, said that they had had to work hard and long to secure the year's results. A year ago he said that no man could tell what the difficulties of obtaining supplies of metal, &c., used in their manufactures might be in the near future, and that applied even more so to the conditions that obtained to-day. No supplies could be obtained except against cash in advance, and that meant that a big bank balance was needed. Their order-book was naturally congested, and they were anxious to cause their regular customers as little inconvenience as possible.

The directors report to the following effect for 1915 (the figures in parentheses are for 1914):—

Charing Cross, West End & City Electricity Supply Co., Ltd. *West End Undertaking*.—Gross earnings, £138,964 (£142,086); expenses, excluding depreciation, £70,068 (£69,677); net earnings, £68,895 (£72,409), plus £18,000 brought forward, interest accrued for 1915 £2,978, and transferred from general reserve (income) £6,000. The available total is £95,873. Out of this, debenture interest requires £17,829, depreciation £22,000, preference dividend £18,000, and 5 per cent. is paid on the ordinary shares, the same as for 1914, carrying forward £18,044. There are now connected to the mains in the West End 718,023 (equiv.) lamps, as follows: Lighting, 458,345; heating, 36,572; 223,111 (8,982 h.p.) in motive power. Units generated, 5,934,552; bought, 8,454,628; sold, 11,440,835; used on works and in transmission and distribution, 2,948,345. Public lamps, 303; units sold for public lighting, 313,638.

City Undertaking.—Gross earnings, £158,357 (£153,689); expenses, £94,590 (£86,983); net earnings, £63,767 (£66,706), plus £18,000 brought forward. The available total is £81,767. Out of this, £30,459 is required for interest on debenture

stock, loans, and advances, the preference dividend absorbs £15,000, £15,208 is put to general reserve (income account, leaving £15,000 to carry forward. There are now connected to the city mains 222,700 (equiv.) lamps, as follows: Lighting, 321,053; heating, 57,516; motive power, 313,500 (13,811 h.p.); lights generated, 29,031,120; bought, 172,554; sold, 21,041,557; used on works, &c., 5,768,817.

Oxford Electric Co., Ltd. The profit for 1915 was £13,310, including £1,055 brought forward. Debenture and other interest requires £2,016, there is written off hire-purchase installations £686, 5 per cent. is paid on the pref. shares, and 6 per cent., less income-tax, on the ordinary, £1,040 is put to reserve and plant renewal account, and £968 is carried forward. The demand for light decreased owing to the war, and the heavy cost of fuel also adversely affected the revenue. Mr. E. A. Benders has been elected a director in place of the late Prof. T. L. Bullock. Annual meeting: March 7th.

Torquay Tramways Co., Ltd. For 1915 the profit was £13,691, and after deducting debenture charges there remains £6,511, plus £857 brought forward. To reserve and renewals £2,500 is put, 3½ per cent. (the same as last year) is paid on the ordinary shares, and £941 is carried forward. The traffic revenue fell from £28,111 to £28,070, the passengers carried from 4,295,225 to 4,225,177, and the car miles run from 627,110 to 629,756. The average receipts per car mile fell from 10.87d. to 10.84d., but the average receipts per passenger increased from 1.56d. to 1.57d., and the cost of energy per car mile from 1.84d. to 1.91d. At the annual meeting held on February 11th, the chairman, Mr. W. B. COWIE (who presided in the absence of Mr. Schlesinger through illness) said that the result was a good testimony to the stability of the undertaking. The receipts this year so far showed an increase of £253 over those to the same date last year. Under the agreement with the Corporation it was provided that when the market price of suitable coal exceeded 20s. per ton, the price of current could be increased by agreement, or by an amount to be settled by arbitration. The Corporation had intimated that they intended to charge an extra ½d. per unit, which they considered grossly excessive; arbitration would, therefore, probably be resorted to. If the price awarded by the arbitrator materially affected their costs, they would have to re-arrange their services and stages. The total operating cost per car mile run was 6.09d., against 6.23d. in 1914. The chairman expressed appreciation of the services of the manager, Mr. H. J. Nisbett, and his staff. A number of women conductors were at work and giving entire satisfaction.

Newcastle-on-Tyne & District Electric Lighting Co., Ltd. At the annual meeting on February 25th, Dr. J. B. SIMMONS said that during the year third mortgage debentures for £30,000 were issued to provide for the erection of new plant at Newburn, which came into operation at the beginning of the year; that plant had enabled them to reduce the works costs. Loans had increased by £39,335, the money having been expended in erecting plant to supply energy for power purposes. This plant had only recently been put into commission, and it would further reduce the works costs. The capital expenditure during the year was £18,817. As they were unable to obtain delivery of full quantities of coal contracted for, they had to purchase coal in the open market, and it had adversely affected the profits. To meet the additional costs the price for energy supplied to ordinary customers was raised as from the June quarter meter readings. The total gross receipts for electrical energy showed an increase of £9,301 over 1914. The loss of receipts due to lighting restrictions was £3,700, but this had been compensated for by the increased demand for power. The net profit for the year was £15,965, an increase of £555. In view of the exceptional circumstances due to the war, and the uncertainty of what was before them, the directors decided that it would not be wise to recommend the payment of a dividend, believing that in these times a cautious and conservative policy was essential.

London Electric Supply Corporation, Ltd. Mr. R. H. BENSON, presiding at the annual meeting on February 24th, said that after his warning of last year regarding the set-back which was inevitable during war-time owing to the price of coal and restricted lighting, they would not be surprised to see that, while the gross revenue broke the record at £213,964 against £191,190, the net revenue was only £77,657, against £93,234. Owing to the higher coal and wages costs, the cost per unit sold was nearly ½d. instead of 3d. The present net revenue had only been twice exceeded. This year the amount put to reserve was double the amount paid in dividend. He wished it were more but it was a substantial amount against the risk of purchase in 1914. In anxious time when there was less profit, the work and responsibility of the staff were hardest. They could realize what a trying time it had been to generate and sell 39,757,581 units, against 46,243,065 in 1914, under war conditions, with depleted staff and irregular supplies of indifferent coal, requiring careful selection and sorting. Special thanks were due to Mr. Partridge and the staff, and to the managing director. But for the war they would have had a record year—£20,000 more net revenue, or even more. He must not predict as to the future; they

had just got to keep things together as best they could, and so be ready when peace came to supply their customers as usual. Mr. R. STEWART BARN, the managing director, followed with the usual technical particulars. The capital expenditure of the year was chiefly for a new battery of boilers and accessories, and the laying of five miles of new mains, principally for industrial power, which continued satisfactorily to increase. The total h.p. of motors connected was 15,688 h.p., and contracts for a further 1,594 h.p. had been received. The receipts were up by nearly £25,000, and the expenditure by over £38,000 (coal accounted for over £70,000 of that, and the balance was increased wages, both due to the war). They consumed 90,000 tons of coal at 19s. 9d. per ton, as against 75,000 tons at 14s. 1d. in the previous year. There had been great difficulty in getting deliveries owing to shortage of steamers, and the bulk had been delivered by rail. It had been of an inferior quality, which meant larger quantities at greatly increased prices. The difficulty of obtaining an adequate supply of coal had not diminished since the last meeting. While the cost per unit sold increased from 0.50d. to 0.64d., the average selling price advanced from 0.94d. to 0.96d.

Westminster Electric Supply Corporation, Ltd. Mr. J. BROWNE MARTIN, presiding at the annual meeting on February 25th, said that they had had to contend with many adverse causes, and shareholders would be prepared for reduced profits. The normal expansion of business had naturally been checked, and they had suffered considerably from the lighting restrictions. Rigid lighting economy had been practised by many consumers. The total output showed a slight increase, but the revenue decreased by £1,080. This was due to the large increase of 1,010,000 in units sold for power, heating, and cooking, whilst those sold for lighting were less by 750,000. Some of the generating costs had risen appreciably; distribution costs were much the same as last year. Carbons for street lighting cost more by £700, as before the war they came from Germany. Fortunately, the company held a large stock, so that the full effect was not felt in 1915. This year there would be at least a further £1,000 increase. An increase of £758 in management expenses was due to extra wages owing to enlistment of so many of the staff. They had set aside £23,500 to depreciation, as against £30,868 in 1914, in accordance with the recommendation of Sir A. B. W. Kennedy, the engineer-in-chief, who reported to the board on the matter some time ago. In the early days of the company they put very little aside to depreciation, but as soon as the revenue was sufficient they increased the sum to make up for the deficiency in the early years. This had now been made good, and they would henceforth be able to reduce the rate. The fund now amounted to £116,000, the whole of which had been provided out of revenue. They had reviewed the whole of their investments, and set aside out of revenue £2,500 to provide against losses on realisation. That practically agreed with the ascertained loss on the investments realised during the past year. They had sold some of their American securities, and offered others on loan to the Treasury. The proceeds had been invested in War Loan and Treasury Bills, which together aggregated upwards of £70,000. In December, 1914, and March, 1915, they considered the question of raising charges to consumers, but decided not to do so then. In June last, however, they received a notice increasing the assessment, and they were faced with much heavier charges for coal and increased wages, and reluctantly they raised the price by 10 per cent., so that the shareholders should not carry the whole of the burden. The increase took effect in the last quarter of the year only. Owing to the uncertainty of the coal supply, special arrangements were made for storing large quantities, and this had increased the cost per unit generated. Having failed to obtain any substantial relief from the Assessment Committee, they were appealing to Quarter Sessions. Their chief assistant engineer, Mr. C. O. Grimshaw, had been occupied with important duties under the Metropolitan Munitions Committee. They had lost a colleague from the board in Mr. Hayes Fisher, who had been appointed to the post of Parliamentary Secretary to the Local Government Board. They did not propose at present to fill the vacancy. Mr. Hardern, their manager, was serving as a Commander in the Royal Navy. Their mains superintendent, Mr. W. A. Jones, was with the Forces in Egypt, and nearly all eligible men had been attested. They had 97 employees (roughly one-third) on active service—one had been killed, another was missing, ten had been wounded, and three were sick in hospital. It had been difficult at times to carry on the work of the company efficiently in all departments. The Chairman alluded to the death of Mr. Frank Ingo, who resigned the secretaryship after 27 years' service last August. Mr. W. A. Peerman, who had been their accountant for 20 years, had been appointed to succeed him. The meeting passed a vote of thanks to the special constables who had guarded the company's premises.

Jarrow & District Electric Traction Co., Ltd. The revenue for 1915 was £8,855, an increase of £296. After deducting expenses, also debenture charges, putting £800 to renewals there remained £2,911, plus £1,026 brought forward. Of this, £900 is to be put to reserve, 4 per cent. is to be paid on the ordinary shares, and £1,040 carried forward. Annual meeting: March 6th.

Fife Tramway, Light and Power Co.—At the annual meeting, in Edinburgh, Mr. Wm. Low said the Dunfermline and District Tramways Co. had paid over to this company by way of dividend and management fees £13,650, compared with £15,250 for 1914.

An extension of time in which to build certain tramways had, after a very stiff opposition, been granted. Regarding the power and lighting business, the growth had been quite satisfactory, but all properties of this kind had been hard hit by increased costs, particularly in fuel. Fortunately, they carried out large extensions during 1913 and 1914, which enabled consumers to be supplied and current to be generated more economically. The total revenue received from the Fife Electric Power Co. and the electric lighting undertakings as dividends, profits, and fees amounted to £13,567, an increase of £2,291, which was satisfactory. The additions to the power station plant had been completed. Regarding the revenue to be anticipated from the combined properties during the current year, short of some entirely unforeseen contingency, there should be a net result rather better than that of last year.

South London Electric Supply Corporation, Ltd.—The gross receipts in 1915 were £54,782, and the expenditure was £27,553. Including £2,899 brought forward, £30,127 is available. After placing £6,248 to depreciation, paying debenture and other interest, also 6 per cent. pref. dividend, 5 per cent. is to be paid on the ordinary shares, leaving £3,010 to be carried forward. There were added 25,652 new lamps (900 kw.), making the total 366,518 (12,820 kw.). The units sold were 6,318,140, an increase of 164,899. Units generated, 7,926,950. Annual meeting: March 7th.

Tyneside Electrical Development Co., Ltd.—For the year ended January 31st the profit was £2,602, plus £3,427 brought forward. After paying 6 per cent. per annum on the preferred ordinary shares, 10 per cent. on the deferred ordinary shares, and transferring to general reserve £1,000, £3,654 is to be carried forward. The balance of the amount now unpaid on the preferred ordinary shares during 1916 is to be called up.

New York Telephone Co.—Year 1915: Telephone earnings, \$7,743,217 (\$3,836,159 inc.); telephone expenses, \$60,114,877 (\$2,372,479 inc.); net telephone earnings, \$17,633,340 (\$1,463,690 inc.); other income, \$1,877,200 (\$7,906 inc.); total net earnings, \$19,510,540 (\$1,471,486 inc.); interest charges, \$4,049,103 (\$21,971 inc.); balance, \$15,461,437 (\$1,449,515 inc.); dividends declared (8 per cent.), \$10,008,579; balance to surplus and reserves, \$5,452,858 (\$1,449,515 inc.).—*Financial News.*

Telegraph Construction and Maintenance Co., Ltd.—The accounts for 1915 show a net profit of £108,707, after charging the interest on the debentures, plus £111,406 brought forward, making £220,114. In addition to the interim dividend of 5 per cent., the directors propose to distribute a further dividend of 10 per cent., together with a bonus of 12s. per share, free of income-tax, and to put to reserve fund £20,000, leaving £110,474 to be carried forward.

Stock Exchange Notice.—The Committee has ordered the unmentioned to be quoted in the official list:—

Bombay Electric Supply & Tramways Co., Ltd.—Further issue of 12,000 ordinary shares of £10 each, fully paid; Nos. 120,001 to 132,000; and £10,000 5 per cent. second mortgage debentures of £100 each, Nos. 2,001 to 2,100.

County of London Electric Supply Co., Ltd.—The directors recommend a final dividend on the ordinary shares at the rate of 9 per cent. per annum, less income-tax, making 7 per cent. for the year, the same as for 1914. £40,000 has been placed to reserve for depreciation, leaving £14,000 to carry forward.

Northallerton Electric Light and Power Co., Ltd.—At the annual meeting on February 23rd, the directors reported a net profit of £496, which is to be credited to reserve. £500 was written off plant for depreciation.

City of London Electric Lighting Co., Ltd.—After placing £50,000 to reserve and paying 6 per cent. on the preference shares, and 8 per cent. on the ordinary shares (as against 9 per cent. for 1914), £17,500 is to be carried forward.

Metropolitan Electric Supply Co., Ltd.—The directors recommend a final dividend at the rate of 2 per cent., making a total of 3 per cent. for 1915, as against 3½ per cent. for 1914, placing £27,000 to reserve, and carrying forward £4,978.

Calcutta Electric Supply Corporation, Ltd.—The units sold to consumers during the four weeks ended January 28th were 1,354,635, compared with 1,022,022 in the corresponding four weeks of 1915.

Tramways, Light and Power Co., Ltd.—Including £1,712 brought forward, the receipts for 1915 were £32,213. After meeting debenture charges and paying 6 per cent. pref. dividend, £3,348 is to be carried forward.

Automatic Telephone Manufacturing Co., Ltd.—A dividend of 4 per cent. on the ordinary shares for 1915, writing off £11,500 and carrying £6,774 forward, is announced. For 1914 the dividend was 3 per cent.

Lancashire United Tramways, Ltd.—For 1915 the traffic receipts were £90,578; miscellaneous receipts and electrical energy sold produced £6,249. Less working expenses £54,993, cost of generating electrical energy sold £4,066, general charges, £5,210, rent of leased lines £5,191. Add dividend on holding in New St. Helens and District Tramways Co., Ltd., £1,534, making profit of combined undertaking £28,901. The interest and dividends received from the operating companies together with sundry receipts, amounted to £14,017. After deducting interest on prior lien debenture stock and expenses, there remains £198, which has been carried to depreciation account. There is also a balance on the year's working of the operating companies, after payment of interest and dividends before-mentioned, of £16,203.—*Financial.*

Electro Bleach and By-Products, Ltd.—For 1915 the profits, after allowing for depreciation, &c., are £25,574. After charging debenture interest and writing 30 per cent. off the preliminary expenses a net profit of £22,924 remains. The directors recommend a dividend of 7 per cent. on the ordinary shares, placing £4,000 to reserve, and carrying forward £722. The profit is below expectations owing to the war and failure to obtain delivery of new plant.—*Financial Times.*

Mackay Companies.—Quarterly dividend of 1½ per cent. on the common shares is announced.

STOCKS AND SHARES.

TUESDAY EVENING.

Until the new War Loan is out, markets are bound to be more or less under the shadow of its coming. The buying of the 4½ per cent. issue has ceased, and there is a general slackening of prices in other investment departments. At the same time, the tone round the markets is one of confidence and steadiness. The frenzied battles round Verdun are taken as an omen of the German onslaught at its apex; and, this having been repulsed, there is much satisfaction at the result of a movement which must have cost the enemy terrible toll in life and munitions. So that where dulness is perceptible in prices, it may be ascribed to the coming of the new War Loan, a King Charles' Head that will probably have a knack of getting into Stock Exchange reports until the terms of the issue are actually known.

The City of London Electric Lighting Co. has declared a dividend of 10s. a share, making 8 per cent. for the year, as against 9 per cent. paid for 1914. This is a slight disappointment, because most people had been expecting the company to repeat its previous performance. There was a small decline in the price of the shares upon the announcement; it is argued, however, that 8 per cent. in these difficult days is an achievement by no means despicable.

The County of London Electric Supply Co. declares a dividend of 9 per cent., making 7 per cent. for the year, and so maintaining its previous rate. This came up to expectation, as foreshadowed here already; the price of the shares has risen ¼ to 104. There is not a great deal doing in the other Metropolitan issues; but, the dividends being out and the worst known, it seems that there is rather a tendency for people to buy electric lighting shares again, and quite possibly the market may now slowly recover.

Gossip has it that matters are none too peaceful on the board of one of the electric light companies concerned with the supply of current for power and lighting purposes. One section of the board is understood to favour the adoption of such a price for current as would probably check any widespread demand for it, while others take a more liberal view and point to the prices being obtained by kindred companies as the best criterion to measure what customers would be likely to pay. There may be lively scenes at one of the meetings to be held in the near future, and the outcome is awaited with a good deal of interest.

In the railway market there is very little fresh of interest. If anything, the tone is heavy as a whole. The reports have now been issued by the various companies concerned in the Underground group; and while they mostly show good results, progressive in character, and there is nothing sufficiently startling in them to attract the attention that leads to buying. Underground Electric income bonds are amongst the popular stocks for the time being, no doubt in consequence partly of the fact that the present quotation carries 23 net interest; the price will be ex this interest on Wednesday. The shares fluctuate spasmodically, and both kinds show improvements this week.

Globe Telegraph ordinary strengthened ½ on the declaration of the usual quarterly dividends of 3s. on the preference and 2s. on the ordinary, payable on March 31st. The market for telegraph issues as a whole is steady, falls of ¼ in Western Telegraph ordinary and ½ in Anglo-American preferred being associated with a little selling on behalf of deceased accounts. Eastern ordinary lost ½, but Great Northern Telegraphs are an equal amount to the good. The Government's price for New York Telephone bonds is lower at 100½, or 104 for dollar bonds. Callenders lost their 5s. rise of last week, and Henley preference were marked down to 4.

Mexican industrial issues are lower, and further falls have occurred of two or three points in the common shares and the bonds of the Mexico Tramways and the Mexican Light

and Power Companies. Curiously enough, there is still a demand for Mexican Railway issues; but the utility descriptions some of the holders are trying to sell, rather than join the committee that has been formed for the protection of the bondholders, the obvious reason for such attempted selling being that the proprietors have lost both hope and patience. Anglo-Argentine Tramway 5 per cent. debenture stock is easier, and Brazil Traction fell to 51 on the course of the exchange being unfavourable to holders. British Columbia Electric is dull.

The Public Trustee, as executor for a deceased holder of £12,960 income securities of the British Electric Traction Co., has appealed against a reduction of the B.E.T. capital; and the case came before the Court on Monday. The counsel in support of the appeal pointed out that the resolutions in favour of the reduction in capital had been validly passed, and demurred to the statement of the Master of the Rolls that the company appeared to have had a disastrous record. The hearing was adjourned for further evidence on behalf of the company.

Copper shares are a little irregular, after having been in the ascendant in consequence of the sensational rise in the price of metal. The rubber share market is one of the best in the Stock Exchange, as it is certainly the busiest. Upon a recovery in the price of the material to 3s. 9d. per lb., a fresh impetus was given to buying of the shares; and the appetite of the public for investment varieties appears to be as keen as ever.

The following is our representative list of securities connected with the various electric markets:—

SHARE LIST OF ELECTRICAL COMPANIES.

Rule-of-Thumb in Percentages.—A contributor to the *Electrical World* has made the remarkable discovery that the approximate rule that "the resistance of copper increases 1 per cent. for each 2½° C. of temperature increase" works only one way—i.e., given the resistance hot, you cannot find the resistance cold by deducting 1 per cent. per 2½° C. of temperature drop—and hammers the point home to the readers of our contemporary in some 50 odd lines. Similarly we may point out, in illustration of the same discovery, that if his article had been 100 per cent. longer, it would merely have been doubled in length, whereas if the double-length article were made 100 per cent. shorter, nothing would be left of it but the headlines!

We may suggest that the interesting fact that $-a$ squared is always $+a^2$, whilst the square root of $+a^2$ is not necessarily $-a$, might usefully form the subject of a further contribution to our contemporary's pages.

Miners' Safety Lamps.—The Home Secretary has called the attention of makers of miners' electric safety lamps to two accidents with electric lamps of an approved type which occurred in December last, due to ignition of celluloid. While the lamps were in use underground, a quantity of dense smoke was evolved inside them, and in one case such pressure was developed as to burst the lamp open. In the other case the lamp did not burst, as it was not tightly screwed up, and the pressure was relieved by the gas escaping. On subsequent examination and experiment it appeared that the accidents were due to the loose spring terminals with which the lamps were fitted. These had been accidentally bent over, and had come into contact, with the result that the accumulator was short-circuited, and the heat thus generated was sufficient to decompose the celluloid of the accumulator case. In order to prevent the occurrence of accidents of this kind in future, the Secretary of State has decided to prohibit the use in approved miners' electric safety lamps of spring terminals liable to be bent over, and a general provision to this effect will be included in the next Safety Lamp Order to be made shortly. Any electric lamps at present in use which are fitted with such terminals should accordingly be refitted at once with rigid terminals. This has already been done by the maker of the type of lamp with which the accidents occurred.—*Colliery Guardian*.

METAL MARKET.

Fluctuations in February.

THE RESISTANCE OF A CUBE.

By A. J. MAKOWER, M.A.

IN the issue of February 4th, of the ELECTRICAL REVIEW, a reference is made to the indeterminate nature of the problem of finding the resistance between diagonally opposite corners of a cube made of sheets having a resistance of one ohm a side. It was suggested that as the resistance of a side depends on the manner in which the current enters and leaves, the resistance of the side should be defined as referring to the case in which the current flows uniformly from edge to edge. The following considerations show that a more convenient assumption is that the resistance of each side should be defined as the resistance of a side from corner to corner.

If a square sheet be connected by its corners to a source of electric current the stream lines will be of the nature shown in fig. 1. The symmetry shows that the resistance of the square between A and B is the same as the resistance under the conditions of

FIG. 1.

FIG. 2.

flow, of the shaded area between the point A and the side CD, as the complete resistance is made of a parallel arrangement of two circuits each consisting of two areas in series similar to the shaded area. If we now consider the case of the cube and look at it from a feed-point F, as shown in fig. 2, it will be seen by symmetry that the stream lines in every face will be the same, and that the stream lines in the shaded areas of figs. 1 and 2 will correspond. Now, the resistance of a given shape of a given sheet-metal is independent of its actual size, and thus we may

FIG. 3.

determine the resistance of a cube in terms of the resistance of a square sheet of the metal between corners as defined in fig. 1, or, what is the same thing, in terms of the resistance of the shaded area of fig. 1. The cube consists of two portions, similar to the portion viewed in fig. 2, connected in series. Each of these portions consists of six areas similar to the shaded area in parallel. Thus the cube will have a resistance of two-sixths or one-third of the resistance of one of the shaded areas, or, in other words, the cube will have between its diagonally opposed corners a resistance of one-third the resistance of a square sheet of the metal measured between its diagonals.

The simplicity of this rule follows from the fact that the stream lines are similar in the two cases compared, but if the resistance of the cube were referred to that of a square between its edges, the different nature of the stream lines in the two cases would cause the relation to be much more difficult to determine.

Electrolytic Zinc Plant.—The success of Anaconda's experiments in the production of electrolytic zinc is definitely settled by the announcement that a \$2,000,000 plant is to be constructed at Great Falls, where cheap electric power is available. Research on this subject has been under way for months, and will now culminate in a plant that is to be in operation about September of this year. The reported capacity is 70,000,000 lb. per annum, and the power requirement 30,000 H.P. Zinc concentrate will be roasted and leached with sulphuric acid; the solution will then be purified by precipitating iron by means of limestone and copper and cadmium by zinc. The purified zinc sulphate solution will then be electrolysed with insoluble lead anodes and either aluminium or zinc cathodes.—*Met. and Chem. Engineering.*

Electric Steel.—The Apollo Electric Steel Co., U.S.A., which has just been organised, has ordered from the Snyder Electric Furnace Co., of Chicago, two 12-ton single-phase furnaces, each of which will have a daily output capacity of 100 tons of steel. The new steel concern plans to market high-grade steel in the shape of bars, billets and special products. Electrical energy from the lines of a near-by central station company will be used to operate most of the company's machinery.—*Electrical World.*

In order to corroborate the above reasoning, a cube with 6-in. sides was made of a sheet of tin of No. 22 S.W.G. gauge. Before cutting up the sheet the resistance of an 18-in. square, measured between corners as in fig. 1, was found to be 0.00174 ohm. The sheet was then cut up and formed into a cube, and the resistance was found to be 0.000546 ohm, which is near enough to one-third of the value, 0.00174 ohm, to confirm the law given.

It is interesting, in view of the reference made above to the resistance between opposite edges, to state that the resistance of a square sheet of the material used was determined between its edges by feeding a strip at six points, as shown in fig. 3, and measuring the current taken and the voltage drop between the lines *ab* and *cd*. In this arrangement, the stream lines in the small central square are practically uniform, as shown by the lines drawn. The resistance of the square was found to be 0.00026 ohm, or 0.15 times that of the square fed at its corners. Using this figure, we see that the resistance of the cube between diagonally opposed corners will be $2\frac{1}{2}$ times that of one of its sides measured between opposite edges, instead of two-thirds of that resistance, as given in the issue referred to.

It is not simple to solve the problem of the diagonally fed square mathematically, but very close results may be obtained by graphical methods. If the stream lines be drawn in directions that seem to be reasonable, and the area be divided up into a number of nearly rectangular areas by the stream lines and the equipotential lines normal thereto, the resistance of the area can be predetermined with a fair degree of accuracy. The writer has obtained a value agreeing with the test values within 10 per cent. by dividing the area into about 120 small rectangles in the above-described manner.

ELECTRIC SMELTING OF IRON ORES IN SCANDINAVIA.

(Concluded from page 235.)

The Tinfos Furnace.—Apart from an experimental 5,000-H.P. Helfenstein furnace at Domnarvet, of which particulars are available, the only experience so far gained with this type of furnace is from the operation of small units at Notodden, so it cannot be said to have yet had the opportunities of development that have favoured the Elektrometall type.

The furnace is shown diagrammatically in fig. 1. The smelting chamber *A* is long and rectangular, having one carbon electrode, *B*, embedded at its base. There are three upper electrodes, *C*, and these are movable. The charge of ore, limestone, and coke is fed through the rectangular chutes *d, e*, extending right along the furnace. Two hollow water-cooled beams, *F* and *G*, support the roof and the chutes. The pig-iron and slag are tapped from one end.

Three-phase current is used to operate the three furnaces at Notodden, each taking about 1,600 H.P. at 35-55 volts, 50 cycles.

The arrangement by which the electrodes are in the middle and the supply of ore lateral is said to favour economy of heat. The furnace gases pass up the chutes, and help to heat the incoming material. For the rest the gases could be utilised in other ways, but at present that is not done. An advantageous feature of the furnace is that it uses coke, and not charcoal, but coke containing 1.2 per cent. sulphur can be made to yield pig-iron with a content as low as 0.01 per cent. The furnace uses purer ores than the Elektrometall furnaces, and, the units being smaller, no useful comparisons can be made. In some tests recorded the consumption of energy in the furnace itself was 2,800 K.W.-hours per ton of white pig-iron and about 3,000 per ton of grey pig, using a 44 per cent. ore.

The chief disadvantage of this type of furnaces, compared with the Elektrometall, is that it uses single-phase current, so that on a three-phase circuit three furnaces have to be coupled together. On the other hand, the bottom electrode ensures all the current passing through the whole mass of molten iron, and the regulation of the height of the electrodes required in the three-phase Elektrometall, to ensure even distribution of current, is here unnecessary. The single-phase furnace has, however, the disadvantage of using a lower voltage, so that the losses in transmission and transformation are proportionally higher.

The Rennerfelt Furnace.—This is a new type of melting and refining furnace, invented in 1912. Up to the present, as many as some 20 furnaces have been built for Sweden, Norway, England and Russia, the largest having a capacity of 3 tons. It has been very successful in these small units, and the users are said to be most enthusiastic in regard to them. Mr. Rennerfelt hopes to be able to build units up to 50 tons capacity, or even more.

The furnace resembles the Stassano, in that it is of the "independent arc" type, but instead of the heat of the arc being merely reflected, or radiated down on to the charge, the arcs are so arranged as to be deflected themselves down upon the metal to be melted. The method is made clear from fig. 2, from which it will be seen that there are three electrodes, two horizontal and one vertical. They are supplied with two-phase current, the vertical electrode being the common return. The arc produced forms a flame extending vertically from the central electrode, and forced downwards by the magnetic force produced by the current itself. Fig. 2 also shows how the low-voltage two-phase current is transformed from high-voltage three-phase.

The furnace itself consists of a cylindrical steel shell, mounted on trunnions, so that it can be tilted. It is lined first with 1½-in. asbestos board, and then with fire-bricks, with an inner lining of magnesite bricks. Magnesite bricks line the roof, too, and thus a very high temperature can be maintained. The furnace's cavity is egg-shaped, as shown in fig. 3. In the larger furnace the cylinder is extended and several sets of arcs are used. A 40-ton furnace would have four sets of electrodes of 6 in. and 7 in. diameter. Graphitised electrodes are employed; they are smaller than amorphous carbon, so that the size of the openings is kept down. The consumption of electrode is only 3 kg. per ton of steel, and in the smallest furnaces the energy consumed does not exceed the moderate figure of 1,000 K.W.-hours per t.n. of steel for castings. The power required for a 600-kg. furnace is 125 KW at 80 v.c./s. For larger sizes it would decrease to about 120 KW

SECTIONAL PLAN ON A-B

FIG. 1.—THE TINFOS FURNACE.

FIG. 2.

FIG. 3.—SECTION OF RENNERFELT FURNACE.

per ton capacity. The furnace has been successfully used for melting ferro-manganese for use in Bessemer and open-hearth furnaces, as well as for melting steel for castings, which is its normal function.

Conclusions.—Dr. Stansfield, from his study of Scandinavian conditions, arrives at the conclusion that although electric iron smelting cannot at present hope to compete generally with the blast furnace, in certain localities where pure iron, charcoal, and cheap water power can be obtained, it should be possible to produce economically a high-grade charcoal pig-iron, for the manufacture of special qualities of steel and wrought iron. Dr. Stansfield's interest is, of course, chiefly in Canada, and he points out that Canadian ores are not nearly so pure as Swedish ores. Nevertheless, impurities like sulphur are eliminated very thoroughly in the electric furnace, and it seems possible, so he concludes, using ores of moderate purity and a cheap fuel such as charred wood refuse or gas coke, that a good quality of iron suitable for car wheels could be made at a profit in one or other of the electric furnaces at present in use. This is more likely to be the case if a furnace such as the Elektrometall type were to do away with its shaft and its circulating system, and instead utilise the heat of its gases outside the furnace in heating open-hearth furnaces for turning the pig-iron into steel. It is noteworthy that the gas produced in making a ton of pig-iron in the electric furnace would almost suffice for the production of 1 ton of steel in the open-hearth furnace.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Triumph Hand Lamp.

We have received from MESSRS. WARD & GOLDSTONE, of Sampson Works, Salford, particulars of their Triumph electric hand lamp or torch, for which exceptionally long hours of burning are claimed. When fitted with the firm's "Volex Duo" dry battery, which measures 6½ in. long by 2½ in. wide, about 150 burning hours are obtained, using a 2½-volt metal lamp.

An accumulator giving the same burning hours would be much heavier and larger, and we understand that the "Volex Duo" dry

FIG. 1.—TRIUMPH ELECTRIC HAND LAMP.

cell will hold up in stock for several years. On account of its long-burning hours, this lamp is recommended for use in factories, warehouses, &c., as a safeguard against the inconvenience of sudden extinction of the ordinary lighting.

The Arora Electric Fires.

The ARORA Co., of Loughborough, which was started in the summer of 1915 marks a distinct advance in this branch of the electrical industry, under most propitious circumstances. Mr. Eric W. G. Burder, a keen member of the Loughborough Electricity Committee, who had an engineering works and foundry at his disposal, appreciated the great progress that electric heating and cooking was making; he met Mr. F. S. Grogan, who had patents pending, and possessed an exceptionally complete knowledge of what the public required, and their experience and resources were combined with the intention of providing, direct from the foundry, solidly built and reliable apparatus for heating and cooking at popular prices. The works extend over many acres on the outskirts of Loughborough, and have a private railway siding; goods can also be despatched on two main railways, ensuring prompt delivery to all parts of England.

The "Arora" fires, one of which is illustrated herewith, are fitted with an element built of an extra-heavy section of wire, which under ordinary circumstances would not glow, but owing to the patented form of construction, a pleasing glow is obtained at

FIG. 2.—THE "ARORA" ELECTRIC FIRE.

quite a low current density, and a maximum of radiant heat is produced. Elements of the most non-oxidisable metal have in the past oxidised sufficiently to reduce the consumption materially and consequently the heat produced. With the Arora heavy elements, this defect is reduced to a minimum. The elements are mounted on fire clay of exceptional strength. The frame-work is of cast iron throughout, in two main parts, the fire box and the front. The former is a complete unit forming a standard part, which is interchangeable with any front of the three finishes listed. It contains two 750-watt bars, two switches, and two heavy terminals complete with two yards of 70/36 S.W.G. flexible cord, and is

attached to the front frames by means of two bolts only. The fire bars are also interchangeable, and may be obtained at a very low cost. The solid frame-work and parts are practically indestructible, and may at any time be made equal to new stock for a few shillings. The total weight of the fire is 19 lb.

Arora fires Nos. 1, 2 and 3 (as illustrated in fig. 2) were put on the market in the middle of January this year, and we are informed that within a month orders were executed for over 40 corporations. Many repeat orders for large numbers have since been received, and strong approval has been expressed with regard to the particularly pleasing high-temperature effect and the remarkably low prices. We understand that Nos. 11, 12 and 13 are now coming through the works; they are similar to that illustrated, but 3 in. higher, to allow of the addition of a third fire bar. We also learn that very shortly a boiling plate of the open type will be put on the market, to meet the demands of the public and many central-station engineers for a quick, reliable boiler at low price.

Mr Grogan's many friends will be glad to hear of his new venture, and will join with us in wishing him success; few men have done more than he to develop the employment of electricity for cooking, and we believe he is working on the right lines—radiant heat and low prices.

Ediswan Dry Cells, &c.

We have received from the EDISON & SWAN UNITED ELECTRIC LIGHT CO., LTD., of Ponders End, Middlesex, a sample of their Ediswan "O.K." dry cells, which they are making in their own works. The cell measures about 6 in. high and 2½ in. in diameter; short-circuited through an ammeter for a moment, it gave 3½ amperes, and when put on discharge through a resistance of 5 ohms at 0.2 ampere, it stood up well to the heavy demand upon it, for nearly eight hours a day, four days in succession. During that period the output was 4 A.H., and the current had fallen to 0.12 ampere, but recovered to 0.15 after a rest. Later on, when short-circuited, it gave nearly one ampere for an hour and a half. So

FIG. 3.—"EDISWAN" SHELL-INSPECTION LAMP FITTING.

far as we can judge from these rather haphazard tests, and the appearance of the cell, it ought to do good service in connection with bells, telephones, fire-alarms, &c.

We have also received from the company particulars of their "Ediswan" shell-inspection lamp fitting, which is provided with an earthing device, and is sent out wired complete with lamp holder, and three yards of 3-way flexible cord, the latter including the earthing wire. The fitting, which is shown in fig. 3, is extra strong, with a view to hard factory use, and is very cheap.

New Burglar and Fire Alarm.

MR. ARTHUR JULIAN, of Bank Chambers, Reading, noticing whilst he was in the United States the remarkable frequency with which safes were dynamited by thieves, conceived the idea that a combination of a pneumatic and an electric alarm would form a considerable improvement upon the existing system (winding a great length of insulated wire round the safe, and keeping a current continually flowing in the circuit, any interruption of the current giving an alarm). His plan is to include in the design of the safe a double lining of thin metal, either inside the walls and door or sandwiched between the plates of which the walls and door are built up, and to connect the cavity with a U-tube containing mercury and a platinum contact wire. The air in the cavity is under a slight compression, forcing the mercury out of contact with the platinum wire and the ends of a circuit containing a bell and battery are connected with the mercury and platinum. Under normal conditions, the circuit is kept open, thus avoiding the expensive renewal of batteries incurred with the closed-circuit system; variations of atmospheric temperature, if not negligible, can easily be compensated for. Should the air-pressure drop, owing to the wall or safe being drilled through or to other unlawful tampering with it, the mercury column at once would close the alarm circuit; the same result would follow if an accidental leak took place, the device, therefore, being self-testing. There is no difficulty in connecting the door of the safe to the alarm system. To guard against tampering with the pipe which connects the safe with the alarm apparatus, the inventor inserts into the tube three steel wires, which render it practically impossible to close the pipe by hammering, melting, or other means without allowing the air to escape and give the alarm.

Another application of the invention is to fire alarms. A system is already in operation in which a small-bore metal tube attached to a contact device is led round the ceiling of the room to be protected, the expansion of the air contained in it immediately giving warning of the outbreak of fire; Mr. Julian would put the air in this tube under slight pressure, so that the occurrence of a leak would instantly betray itself. In this case two platinum contacts would be required, one to announce a leak, the other to give an alarm in case of fire. He has also devised a burglar-proof bell to mount on the outside wall of a building in connection with a burglar alarm inside, the same principle being employed. Mr. Julian has patented the device in Great Britain and elsewhere,

and has provided for the apparatus being operated either on the plenum system, as above described, or on the vacuum system, which of course is an obvious alternative. We understand that he is open to negotiate with firms desirous of adopting the system.

Liquid Starting Switches and Controllers.

A novel type of throw-over automatic liquid starting switch has recently been invented and patented by Mr. J. H. WOOLLISCROFT, A.M.I.E.E., general manager of Messrs. H. T. Boothroyd & Co., of Liverpool. One of the best-known types of liquid starter is the Woolliscroft automatic liquid drum starter and controller, which is in extensive use; the new arrangement, however, possesses distinct advantages even over this satisfactory instrument.

The new switch has been designed to start up automatically motors, &c., at a predetermined speed, irrespective of the manipulations of the operator, and can be justly termed "fool-proof." The

FIG. 4.—STARTER IN "OFF" POSITION; AUTOMATICALLY STARTING, AND HELD IN POSITION WITH N.V. COIL.

device (fig. 4) consists of a circular drum divided axially, the halves being separated by a diaphragm, which is fitted with a two-way unbalanced valve. When the drum is rotated about 120°, it brings the electrodes to the bottom, the liquid being taken to the top and held suspended until it has leaked through the valve to the bottom half containing the electrodes. As the liquid is closing the path of resistance, the air in the electrode chamber, and the gases

FIG. 5.—STARTER IN "ON" POSITION; AUTOMATICALLY SHORT-CIRCUITED. PROTECTIVE COVERS ARE NOT SHOWN IN THE ILLUSTRATIONS.

formed when starting up, are expelled through a special outlet vent, by the liquid acting as a water piston. Also to obviate any vacuum in the top half, from which the liquid descends, this chamber is fitted with a suitable intake vent hole. These vents are essential for practical working.

The switch is fitted with the usual no-volt and overload releases, and, being of the free-handle type, cannot be held in on a short circuit or overload. When the switch returns automatically to the off position, the liquid passes *en bloc* to the lower half without any disturbance or churning, and the air displaced passes unrestricted through the second valve arranged for the special purpose, which is part and parcel of the flap valve; the circuit is immediately opened, and the switch ready to be thrown over at once to the starting position again. This is a valuable feature, especially with reversing motors that require to be tickled rapidly in either direction

of rotation. Another feature is that when the whole of the liquid has passed to the electrode chamber when starting up, the switch automatically short-circuits itself only after opening the electrode circuit and not merely shunting the paths as is usual, which latter method permits gases to be formed and electrolysis to take place, both of which are objectionable. The switch is short-circuited by the action of the two-way unbalanced valve, which when released from the weight of liquid, mechanically trips the contact brush to the short-circuited position with all resistance cut out (see fig. 5). With this arrangement there is not any waste or small currents passing continually, as is usual with solenoid-operated devices, &c.

Should any fault occur with any of the automatic devices (which is hardly possible), the starter can always be used as a plain dipper-type liquid switch, and can keep things going until opportunity occurs for inspection. The original type of Woolliscroft automatic liquid starting gears successfully got over the objection against the use of the early type of liquid starters (which were non-automatic and messy); the new pattern will be most useful for starting motors against heavy starting torque, doing away with expensive friction couplings, loose-belt arrangements, &c.

Being totally enclosed with the exception of the two small breathing or vent holes, which are effectually covered with fine gauze, the switches will fill the requirements for dusty, dangerous and explosive atmospheres.

Lead Melting Furnaces.

THE MONOMETER MANUFACTURING CO. LTD., of Whitehouse Street, Aston, Birmingham, has introduced a patent lead melting furnace, specially designed for the feeding of presses used in the manufacture of cable and compo. pipe. Amongst the special features of the furnace are the automatic control of temperature by the firm's patent self-acting adjustable heat controller; the prevention of oxidation by turning the inert gases from the burners into the closed chamber covering the melting pot; the billet charging apparatus; telescopic outlet pipe; low-pressure burners fed from a gas equalising reservoir, &c.

Many of the leading cable makers use this furnace, and recently one firm has decided to equip its entire lead plant with a battery of these furnaces.

Electric Fire Pump.

MESSRS. MATHER & PLATT, LTD., of Park Works, Manchester, have recently issued a catalogue of fire fighting appliances, containing information to assist the shipowner to comply with the Merchant Shipping (Convention) Act, 1914, the provisions of which are about to come into operation.

It has been usual to install reciprocating steam pumps for fire duty, but Messrs. Mather & Platt draw attention to the possible alternative of an electrically-driven turbine pump, which has, comparatively, a greater output for its weight and size than the steam pump.

A two-chamber turbine pump running at 1,400 R.P.M., as supplied by the firm, will throw two jets horizontally about 60 ft., the water being supplied through 50 ft. of 2½-in. canvas hose with ½-in. nozzle. This absorbs about 23 H.P., and a motor of about 28 H.P. would be suitable for driving it. A motor-driven turbine pump of this type is illustrated in fig. 6.

Current would normally be drawn for the ship's lighting and power installation, but provision should be made for connection to the emergency set which is now usually carried on deck to permit of some amount

FIG. 6.—TURBINE FIRE PUMP FOR SHIP'S USE.

of lighting being maintained and a supply given for wireless purposes, in the event of the main sets being put out of gear.

The Miner's "Scout."

This is a patent mechanical device, which is intended to indicate the slightest movement of ground, when adjusted in a stope or tunnel, and thus to give warning of impending falls of roof. Instant intimation is given to a watchman or to the mine manager's office by the completion of a circuit through the instrument; or the ringing of a bell and the showing of a red light on the device itself may serve, where the instrument is in sight of, or near, the miners. The Mining Commissioners in the South African Gold Mines, and also in Australia, state that there is need for such an instrument, and in the latter country legislation for its use in dangerous mines is about to be introduced.

The patentees are practical miners who have found the use of such an instrument of vital moment to them, as, in many mines in the countries mentioned, the number of accidents through falls of ground or rock exceeds 60 per cent. of the total. They claim that there is no sudden fall of ground without some slight movement some time before, and that this instrument indicates the slightest movement in time to enable the necessary measures to be taken to prevent accidents.

The instrument being inexpensive and of a portable nature, it can easily be carried and used in various parts of a mine. It is of very simple construction, consisting of two brass tubes telescoping together, but kept extended by a long spring inside them, and a box is fixed to the upper tube, containing a battery, bell and red lamp. Contacts on the outside of the box are closed when the tubes are pushed together, by a disk clamped on the lower tube. The outer ends of the tubes are shod with iron, and the instrument is applied by pushing the tubes together until they fit between the roof and floor of the tunnel, against which they are firmly held by the spring; the disk is then clamped close to the contacts, so that any movement of ground which brings the roof and floor nearer together by, say, $\frac{1}{4}$ in., or less if desired, will cause the bell to ring and the lamp to light up. Further information can be obtained from the SLOAN ELECTRICAL CO., LTD., of 12, Golden Lane, E.C.

"WIRELESS WIRING" AT THE FRONT.

THE following is an extract from a letter written by a G.E.C. man at the Front (Corporal Watts) to a friend in Walthamstow, Mr. F. Miller, who kindly forwarded it to us:—

"I must first of all ask you to thank all my pals at the G.E.C. for their kindness to me at Christmas. Indeed, it was good of you all to remember me and to express such kind wishes. The parcel arrived on the very day, but I couldn't say much then as my heart like my mouth was too full. I have never had such a Christmas, and, in many ways, I do not wish for another similar one. A week previous I was working hard for the review. We were successful in obtaining a large hall of a local woollen factory, and as it has only been built about two years it consisted only of the four walls (brick) and a cinder floor. We built a stage and arranged all the seating, and I took charge of the electric lighting. After a chat with the owner we persuaded him to supply us with current from his plant, so that was a great help. Well, I started in on what looked like an impossible job, as it was impossible to obtain any insulated wire or accessories from any of the large towns near. I then had a 'brain wave,' and collected two old inner tubes of a private car and a little rubber gas tubing. I commandeered some No. 8 bare copper wires and slung them across the river from the factory to the hall, insulating by pieces of inner tube nailed to woodwork. As I had no straining instruments, I took up the slack by forcing strips of wood between the leads. I brought the leads right outside the hall for safety's sake, and only brought them in on the stage. The next to tackle was

FIG. 2.

the hall, which I wired in bare No. 20 copper, which we had in stock as binding wire. As with the mains, the insulation was inner tube pieces, 1 in. \times 1 in., under a wire staple. Where dead ends were attached, rubber bands were cut and formed globe strain insulators. [Fig. 1].

All wires were run on the top joists far overhead, so I made pendants with two live wires, separated by 6-in. strips of wood, and 6 in. of flex to enter the lampholder. This made a very satisfactory job, and at night was invisible by the artificial light. In fact, it was christened 'the wireless wiring.'

"Next I tackled the dressing-room, which was directly behind the stage, and as I was not allowed to cut a hole through the wall, I had to take my leads under the top of the door, which consisted of an iron girder, and was easily touched by the face of the artistes as they came off the stage—especially in 'black outs.' To safeguard this I ran the wires through two lengths of rubber gas tube, and labelled the position 'Danger à mort'—danger of death. The lighting of the dressing-room was carried out as the hall, but the leads were fixed to wooden brackets, and the drops were workshop flex. Next the stage. Now the fun started. I found I had used up all my holders and all I had

scrounged from neighbouring columns. Here was a problem—how to bring the lamps into position of utility and out of the way of scene-shifters. Luck is a big factor, so I backed my fancy, and chanced it. My footlights and three lines of battens were all made by drilling holes to take the lamp-cap and soldering two pieces of wire to the contacts, and attaching them to the two leads stretched along the front of the batten by bringing the wires round to the front kept the lamp in position thus [Fig. 2]:—

"One of the staff-sergeants of our neighbours made two stage arcs for us, and they were a work of art. These I had to run for with $\frac{3}{16}$ insulated which was 'scrounged.'

"Now my total was made up as follows:—

Hall.	7 pendants (1 light); 1 cluster (5 lights).
Outside.	1 illuminated sign [REVIEW.] (2 lights).
Dressing Room.	6 pendants (1 light).
Orchestra.	2 pendants (1 light).
	1 signal light (1 light).
Stage.	2 projector arcs (10 amps.).
	18 footlights.
	56 battens.
	1 pilot lamp at switchboard, worked off accumulator, 4 volts, 8 C.P.

"Not a bad load, considering the voltage was 115 D.C. Now came the trouble of the switchboard. Here was a problem indeed. I had obtained 1 D.P. 10 amp., 1 S.P. 5-amp. knife, 3 5-amp. tumbler, 1 3-amp. tumbler, 1 dock plug, but no fuses. We made the board of 2 9-in. planks, 18 in. square, and mounted on two battens, 4 in. \times 2 in. My fuse bridges were $\frac{1}{4}$ in. steel bolts (main, $\frac{1}{2}$ in.) and bus-bars, copper wire bound zig-zag round the bolts. Fuse wire strand of No. 40 copper taken out of flux. Behind each fuse was fixed a piece of mica to prevent fire. With the help of Pte. W. Hossick, of the 18th A.S.P., who worked like the Scotsman he is, we were able to switch on half-an-hour before the dress rehearsal, to which were invited the invalids from the Hospital. As luck would have it, the only main fuses we could get on the switchboard in the mill were German cartridge type, and they only had one pair, 60 amps. You will see we were on the brink all the time, but I am glad to say, all was well. My fuses were only just sufficient, as I dared not blow the cartridges. You can imagine what a relief it was to us electricians to see 'all on.' I won't say the fuses weren't warm—they were hot.

"Our dress rehearsal was Christmas Eve, and we had until Monday night to put the finishing touches, and we were at it to a packed house (average 800) every night of the week. Everything a great success. During the week of showing I had my ordinary work to do as well, so I was not idle. Three times that week I had to go up to the line to fix up a broken-down lorry. My part in the review was not hard, but I had to keep changing. One lot four times in 10 minutes. . . . On the following Sunday we (A.S.C.) gave the kiddies of the village a bun-fight, cinema and concert. This entailed a lot of extra work as the mill was shut down, and I had to divide my lighting into halves and use two of our travelling workshops. On the following day we cleared everything away."

The occasion of the installation above described was the 5th and 18th A.S.P.'s Christmas, 1915, revue, entitled 'Yes, I Think So.' The revue was written and produced by Private R. Douglas, assisted by Private L. Bartlett and Lance-Corporal Topham, while Private L. Bartlett arranged the music. The scenic effects were arranged by C.Q.M.S. Dearden, and the electricians were 5th A.S.P. Corporal Watts and 18th A.S.P. Private W. Hossick. The scenes were laid in 'A Middle-Class English Home—Christmas, 1914,' and 'Grove Park Barracks—January, 1915,' 'Somewhere in England, July, 1915,' and 'Somewhere in France—Present Time.' The last scene was as the first, but at Christmas, 1934; one scene was entitled, 'Recruit's Dream—Horatio Tatus in Automobiling.' Corporal Watts figured as a raw recruit, and 'a lounge and policeman'—whether the last two parts were identical or not is left unstated. Corporal Watts was also responsible for a conjuring turn. The cast included many non-commissioned officers and privates, and one second lieutenant, who appeared in the rôle of 'the duke.' The entertainment appears to have been most carefully and ably planned and carried out, and illustrates the unquenchable good spirits and enterprise of our comrades in France.

A Substitute for Platinum.—An alloy for use in contact and spark devices to replace platinum has been patented by Mr. Paul R. Heyl, of New Rochelle, N.Y. (assigned to Commercial Research Co., of New York City). This alloy consists of silver and palladium, in varying proportions according to the conditions under which it is to be used. An alloy of silver with 2 per cent. of palladium has been found to give satisfactory results under many circumstances. When the contacts or spark points are exposed to sulphur compounds, 5 per cent. or more of palladium should be used. The alloy which was found to give the greatest resistance to spark erosion was that of 60 per cent. palladium and 40 per cent. silver. Additions of palladium to silver raise the melting point and lower the thermal conductivity. It has been found that, on account of the high thermal conductivity of silver, the heat from the spark will be conducted away fast enough to prevent melting of the silver. In view of this fact, silver-palladium alloys with very high percentages of silver can be used in a great many cases.—*Met. and Chem. Engineering.*

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

BRITISH INDIA.—A Customs Circular has been issued by the Department of Commerce and Industry fixing, with effect from January 1st, 1916, the tariff valuations on various articles imported into British India. These valuations differ in many instances from those which were previously in operation. The duty, however, on instruments, apparatus and appliances, and parts thereof—electric, electric lighting, galvanic, telegraphic and telephonic, remains the same, viz., 5 per cent. *ad valorem*; while electrical machinery and component parts thereof (including belting of all materials for driving machinery) remain free of duty. Among the articles for which the tariff valuations have been amended are the following, duty being charged at the rate of 5 per cent. in each case:—

	Former valuation.		New valuation.	
	Rs.	Ans.	Rs.	Ans.
Sal ammoniac	31	0	36	0
Brass, patent or yellow metal, sheets and sheathing, weighing 1 lb. or above per sq. ft., and braziers and plates	54	0	65	0
Copper, braziers, sheets, plates and sheathing	62	0	65	0
Copper, pigs, tiles, ingots, cakes, bricks and slabs	58	0	62	0
Copper, china, white, copperware ... lb.	2	2	2	4
Copper foil or dampspan, white, 10 in. to 11 in. by 4 in. to 5 in. 100 leaves	1	14	3	8
Ditto, ditto, coloured, 10 in. to 11 in. by 4 in. to 5 in. 100 leaves	2	0	3	12
Quicksilver	1	8	3	0
Zinc or spelter, tiles or slabs, soft, cwt.	25	0	50	0
Zinc or spelter, tiles or slabs, hard, cwt.	20	0	40	0

16 annas = 1 rupee = 1s. 4d. (at par).

NORWAY.—Information has been received at the Board of Trade to the effect that the prohibition imposed in September last on the exportation of tool steel and turning steel from Norway has now been replaced by a prohibition on the exportation of tools and tool steel. The prohibition does not, however, apply to such articles produced in Norway and accompanied by certificate of origin.

UNITED STATES OF AMERICA.—A decision has been given by the Board of General Appraisers regarding the rate of import duty leviable under the United States Tariff Act of 1913 on power-transmitting tables for sewing machines. These tables, it is decided, being composed in chief value of metal, and capable of operating at the same time from 5 to 20 sewing machines, are properly dutiable as manufactures of metal not specially provided for, at the rate of 20 per cent. *ad val.*

COLOMBIA.—A Colombian Decree of November 5th provides that when articles liable to Customs duty are sent to the Republic by ordinary or registered letter post, the same duty shall be levied thereon as if the articles were imported by parcels post (i.e., the full duties prescribed by the Colombian Customs Tariff), and that, in addition, a fine of 3 pesos shall be levied for each letter. Packets of books are, however, excepted from this provision, Customs duty only being levied thereon.

NEW PATENTS APPLIED FOR, 1916.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE:—4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGREKAT, LONDON." Code, A.B.C.

Telephone Nos.: City 997; Central 4425 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 6d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

FOREIGN AGENTS:

ADELAIDE: Messrs. Atkinson & Co., Gresham Street.

AUCKLAND, N.Z.: Gordon & Gotch, Albert Street; The Mining and Engineering Review, 31A, Strand Arcade, Queen Street.

NOTICE.

IN view of the recent increase in the Postal Charges, our Subscription Rates for Great Britain and Canada will until further notice be increased to £1 1s. 8d. and £1 3s. 10d. respectively.

IN discussing the subject of organisation in our last issue we touched upon a number of ways in which our national industries may be strengthened by effort from within themselves. While that article was being written a number of leaders to whom we look for a certain amount of direction in these days, were delivering speeches in London on another and by no means less important aspect of the great question of after-the-war trade. We do not agree that discussion of such matters in any degree weakens the nation's effort to speedily bring the war to a victorious conclusion, and we are glad that two very busy members of the Cabinet were able to find time to attend part of the proceedings of the Association of Chambers of Commerce for the purpose of making speeches concerning the relation of trade to the war and the essential nature of the service that traders are rendering to the Empire and the Allies, also to reveal, though only in some small way, what is happening in the minds of members of the Government respecting what assistance the nation should render to industry after the war. Mr. McKenna, the Chancellor of the Exchequer, and Mr. Bonar Law, the Colonial Secretary, a few years ago might not have been credited with the desire to sleep in the same bed, but their presence in the same Cabinet in a period of national crisis, and the consciousness that the position that now confronts us is totally different from any that we have ever known before, have led them to turn their swords into ploughshares, and they are together preparing the ground for a compromise respecting what they formerly regarded as vital differences. Mark first the words of Mr. McKenna:—"We must learn by the experience of the past. . . . We have found ourselves dependent upon that nation (Germany) for many essential matters of our own trade. I do not think that, as a nation, whether by the individual efforts of our traders or with the necessary assistance of Government, we ought ever to allow ourselves to be placed in that position again." He proceeded to show that there was a very large field for common agreement between those who still stood for or against certain principles, but he added what we have said on many occasions: "It does not follow, though trade may be free, that the help of the Government should not be given to assist our traders." Our regret is that the Government did not see it so in days gone by and render a greater measure of assistance, but, as Mr. McKenna says, the Government has learned "by the experience of the past," and it is now about to act. What is to be the course of that action? The most significant and hopeful part of the speech, though somewhat enshrouded in mystery, was this:—

"We are prepared, and we have already shown, in a way which I am not yet able to state to you, that we are prepared to give the assistance of the Government to the development of foreign trade in order to ensure that those rivals who are now our bitter enemies, shall not have the control of the foreign trade which they have enjoyed in the past. . . . In the past there has been some complaint that Government has not given that assistance in distant parts of the world which was rendered by other Governments in similar circumstances. Well, it may be that a policy which is right at one time is not right at another, and it may be that we have to learn that a policy of Government assistance becomes necessary to secure the development of what we might term the master trades, and to secure the extension of our commercial influence through neutral countries."

Here we must leave the Chancellor. We must not venture to probe the inner recesses of the governmental brain, though we confess that we shall await with pleasure the further draught which is so necessary to satisfy our thirst for information.

The attitude assumed by the Colonial Secretary on the following day is in marked similarity to that of Mr. McKenna. "Everything is changed," said Mr. Bonar Law. He is not arguing to convert Manchester electors now, all that is a matter of the dead past—"Everything is changed. We must begin on a new basis; we must put aside all preconceived ideas . . . the problem is not at all the same as we used to discuss, and it must be considered from a new point of view by those who held my views and those who were opposed to them." The probability that after the war there will be special trade relations between those who are now our Allies "completely alters the basis of the problem." As Colonial Secretary he turned from the question of trade with the Allies to the future of our trade within the Empire. "Whether it pays us or not we shall not forget these things (war horrors), and whatever else happens the resources of the British Empire will never again be exploited as in the past by our German enemies." Further, "I do not believe that the people of this country will be satisfied with any system which makes us dependent for the key industries of our trade and for our supplies for war on any nation, least of all on the German nation." We shall all desire to re-echo the tributes which Mr. Law paid to the magnificent service rendered by the Colonies throughout the war. "We could not have won this war, we could not win it now, but for the strength which we have got from the great Dominions." In presence of such a conviction, after the utterance of so momentous a statement, there will surely be none to deny the Dominions a voice in regard to what the after-the-war policy of the Empire shall be, and in that policy the question of trade and industry occupies a large place. Some of the Colonies are already dealing with the matter, so far as they can, endeavouring to exclude German influence both now and after the war. Mr. Andrew Fisher and Mr. Hughes are now in this country. They are both highly charged with messages from the Australian people urging that we adopt no half-hearted measures which will permit of cancerous growth again occurring in vital industries of the British Empire. Mr. Law had all of these circumstances in mind when he said that the problem of the future must be considered in conjunction with the great Dominions as well as in conference with our splendid Allies. He announced that arrangements were being made for an economic conference of the Allies to be held in Paris, at which will be considered both the fuller use of the economic forces of the Allies in the prosecution of the war itself, and the problem of what will happen after the war, when Russia and Italy want to be free from the influence with which German financiers and business men have permeated their industries in recent years. Mr. Bonar Law confessed that he could not fix his mind on "after-the-war" problems at that meeting, and so much depends upon the conference at Paris, that Mr. Asquith on Tuesday was in the same position. As a matter of fact, we all feel how immense these problems are, and how vast will be the attention that they will have to receive before the details can be settled point by point, but apart from the consideration of the details, we can find a common ground in the speeches of these dissimilar men—a definite desire for, and a move in the direction of, a compromise which will bury the controversies of the past and lead us all to adopt some policy or other which shall enable the Home Country, the Empire, and the Allies, so to act in harmony for generations to come as to bring happiness and prosperity, and freedom from external menace, to all the nations that have been so terribly mangled in their efforts to prevent

the domination of the world by Prussian militarism. As there will be no separate Peace, so will there be no separate commercial treaties made with the Enemy, by any one of the Allies. The prospect of an Economic Pact is already giving German traders "furiously to think."

One other speech delivered last week has a close relation to the two referred to above—we mean that of Sir E. Holden, who also appeared before the Chambers of Commerce gathering. His remarks were devoted to the subject of banking, and in our efforts to secure the co-operation of the banks in assisting our industrial development we shall do well to keep his speech in mind. We believe that at heart most people share his admiration for the excellent work that British banks have rendered in the past. It is obvious from his speech that he urges British traders and industrial men to pursue the idea of forming, with the assistance of the Government, a big "additional" banking institution, perhaps on the familiar industrial bank lines, with branches or allied small banks in different countries abroad. By establishing such an organisation Sir Edward holds that "we should be pretty successful in turning the tables on our German banking competitors in foreign countries."

Copper.

THERE has been no great change in fundamental conditions in copper within the last few weeks, although events in all metals have been the subject of the closest attention on the part of the authorities, whose efforts for some time were directed towards the elimination of gambling operations in the metals more particularly required for munition work. Although a warning to that effect had already been given recently in the case of pig-lead, the drastic action taken last week to prohibit speculation in war metals as indicated by the Proclamation came rather as a surprise, and naturally caused some consternation in metal circles, because of its far-reaching effects, also having regard to the difficulties involved in conducting *bona fide* business. Official dealings in copper, as in other metals, barring tin, which was excluded from the Proclamation, were brought to a standstill. Through the representation made to the Ministry of Munitions by a deputation from the Metal Exchange, however, a satisfactory understanding, was arrived at by which it was possible to resume official operations on the Metal Exchange on Monday last. These operations, of course, are now proceeding under the new regulations, or in accordance with the spirit of the Proclamation intended to prohibit speculation with no intention of interfering with the course of legitimate business. A more comfortable feeling has thus been brought about, although the liquidation of outstanding speculative engagements has now to be proceeded with. So far as copper is concerned, the modified aspect of the London official trading can hardly have any important bearing on the course of the general market under present exceptional conditions of scarcity due to the magnitude of the outlet not only in connection with the huge requirements of munition factories in warring nations, but also to the phenomenal extension of industrial enterprise across the Atlantic. There is no blinking the fact that these two factors combined have been for some time past more than sufficient to take care of the whole of the world's output in spite of the considerable increase in the American production to new high records. The American brass industry is now consuming much heavier quantities, the melting of the American Brass Co. alone being at the present time roughly estimated to be at the rate of well over $\frac{1}{2}$ million tons per annum. There has been, too, a notable expansion of electrical enterprise in the United States, partly in connection with important schemes of railway electrification. Very large quantities of copper have been shipped from America to the Allies in the last few months, but these appear to be rapidly swallowed up by the intense pressure of munition work, while it is rather significant that the unsold warehouse stocks of raw and finished metal in this country have been reduced to vanishing point. Sulphate makers now find considerable difficulty in covering their needs in rough bar copper, while the

demand for this material has been very keen at the relatively low prices ruling as compared with the value of American fine copper in the neighbourhood of £136. At the highly inflated level of prices at which their copper has been selling for some time past, American producers have been accumulating enormous profits, and this is not unlikely to continue so long as the war lasts. The bulk of their output has been sold for months ahead, therefore enabling them to be quite independent of adverse movements in the price of standard copper, such as have again been experienced lately amidst the disturbed surroundings. The market is admittedly held at a dangerously high level, but it is hardly likely that American control will be relaxed in view of the present exceptional opportunities.

The I.E.E. and Allien Enemy Members.

THE special meeting which was held last week to "consider" this question presented many unexpected features, not only to the Council and members of the Institution, but also to the interested onlooker. The large and punctual attendance of members at 5 o'clock was in itself surprising, and the intensity of feeling evinced in the course of the proceedings bore additional testimony to the importance attached to the question by them; moreover, the attendance was by no means confined to members resident in the London area—many well-known engineers had come to town expressly to take part in the proceedings. It is easy to understand, therefore, their disappointment when they found that, under the stress of "legal technicalities," it was not competent for them to propose and discuss amendments to the resolution which had received the sanction of the Board of Trade. As we pointed out some weeks ago, a fortnight's notice must be given of the nature of the business to be transacted at a special general meeting, and as barely a fortnight intervened between the calling of the meeting and the date on which it was to be held, it was obviously impossible for members to take any effective action towards varying the terms of the resolution.

Writing after the event, no doubt it is easy to reproach the Council for lack of foresight in approaching the Board of Trade first and the members afterwards; in the absence of a similar experience we might hesitate to criticise the Council on this ground. It happens, however, that the sequence of events closely resembles the procedure which was followed by the Council in 1911, when one week's notice was given of a meeting at which alterations in the Articles of the first importance were to be "considered," with the result that the members claimed their right to a voice in their own affairs, the meeting became a fiasco, and the whole question had to be reopened. The present Council cannot have forgotten those incidents, and, therefore, criticism is justified. On that occasion, writing before the meeting took place, we pointed out that the whole proceeding had an air of precipitation and autocracy, and that the wiser course would have been to allow plenty of time for mature consideration of the new proposals; precisely the same remarks apply to the present situation.

We have no doubt that the wisest course, under the circumstances, was that which was ultimately decided upon—namely, to consult the members first and the Board of Trade afterwards. This is also the routine that would be dictated by common sense, and why it was not adopted in the first instance we are at a loss to understand.

American Lamp Patents.

THOSE of our readers who recall the circumstances which attended the establishment of the Edison & Swan patents for carbon-filament lamps in this country, and their overthrow in Germany, will be interested to learn of the situation which has now arisen with regard to the tungsten lamp patents of Just & Hanaman. In December last we recorded the judgment of the Court of Appeal, according to which the judgment of Mr. Justice Joyce (that the plaintiffs' patent was not for making filaments of tungsten, but only for

making them by the particular process specified) was substantially confirmed, the judgments of both tribunals being directed entirely to the process and not to the material used. The result of the action, subject to appeal to the House of Lords, is at present to throw open the manufacture of tungsten filaments of the "squirited" type in this country, for the process employed for this purpose by the defendants, which was declared not to be an infringement of the plaintiffs' patent, is, we believe, unprotected by letters patent.

On the other hand, we have just received particulars of the decision of the United States District Court, Southern District of New York, in an action brought by the General Electric Co. (U.S.A.) against the Laco-Philips Co., to restrain the latter from infringing the American patent of Just & Hanaman. The defendant company imported into the United States lamps with "squirited" and drawn-wire filaments of tungsten. The U.S. patent specification contained a broad claim for an incandescent lamp filament consisting of tungsten in a coherent metallic state and homogeneous throughout.

The Judge held that the lamps imported by the defendant company infringed the claims of the patent, and he also declared the patent valid. The application was filed in 1905, but the issue was delayed through interferences between four parties, one of whom, with the connivance of one of the Patent Office examiners, had fraudulently introduced into one of his own specifications matter derived from the Just & Hanaman application. In the end, priority of invention was awarded to Just & Hanaman, and the patent was issued on February 27th, 1912, so that it will run until 1929, and if the decision stands, the control of the tungsten lamp situation in the United States will until that date be entirely in the hands of the General Electric Co. and its licensees.

A striking feature of the decision is the fact that the claim of the American patent for a *product and not a process* (though two processes were described in the specification) has been upheld by the U.S. Court, while in this country the whole question turned upon the process and not upon the product.

Repairs to Street Mains and the Law of Negligence.

THE case of *Crane v. South Suburban Gas Co.*, which is reported in a recent number of the *Law Reports*, draws attention to an important point relating to the liability of gas and electric lighting companies whose mains must be repaired *in situ*. Workmen employed by the defendants, a gas company, for the purpose of carrying out repairs to a gas main in a highway, placed a fire pail, on which was a ladle containing molten lead, on unenclosed land adjacent to the highway. The plaintiff, a young child, was playing with other children near the fire when a passer-by accidentally knocked over the fire pail, and the molten lead was spilled on the plaintiff, causing her injury. In an action by the plaintiff to recover damages, the County Court Judge found that the defendants were guilty of negligence in leaving the fire unattended and unguarded with the knowledge that it was surrounded by children and that it was being used for molten lead. In these circumstances two Judges of the King's Bench Division have held that there was evidence on which the County Court Judge could find that the defendants were negligent, and that the defendants were also liable on the ground that what they were doing was a nuisance in that it was dangerous unless precautions were taken to guard persons using the highway from the danger. It is to be observed that the decision was based partly upon the fact that to melt lead in a place situate near a highway was a nuisance for which the defendants were liable if it caused damage. It is clear, therefore, that whenever street repairs are undertaken, the electrical employes should be warned to take the utmost care to keep the melting lead out of harm's way. In effect they are bound to insure the public against any injury which may happen.

THE RENAISSANCE OF THE LOW-TENSION FUSE.

BY JOHN A. CRABTREE.

WHEN, if ever, the history of electrical switchgear comes to be written, it will be found that the last six years mark the "Renaissance of the Low-Tension Fuse." For some time prior to 1910, the general quality of low-tension switchgear had been steadily on the decline in this country. Mechanical strength and electrical efficiency had both been sacrificed for price, with the result that much of the switchgear sold at that time was flimsy, unreliable, and dangerous to operate. An examination and comparison of the average switchgear catalogue of 1909 and to-day, however, will show a remarkable difference and improvement in fuses and fuseboards. In the writer's opinion, this improvement is not merely due to the ordinary processes of evolution, but rather to the compelling forces of the Home Office Regulations governing the use of electricity in factories. Mr. Scott Ram's memorandum (Form 928, 1910) has also had no slight part to play in this development.

It is significant that though the Draft Regulations were published in 1907, and the approved Regulations at the

manufacturer. For years he had grown accustomed to pouring motors, switchgear, and accessories into this country in a steady stream. With one or two marked exceptions, the German fuse failed to comply with our Home Office Regulations, and there were distinct signs, prior to the war, that the Germans were taking strenuous steps to attack the British home trade in ironclad switchgear built to our Home Office Regulations. A great amount of time and paper is being wasted in discussion over the inevitable German competition after the war. The wisest plan, from the manufacturing point of view, is to get to business, and, by thorough organisation and careful design, to produce an article unequalled in efficiency and price. The rest may well be left to the politicians.

The home market has always preferred an easily rewirable fuse. While the cartridge fuse has its many supporters, it cannot by any means be said to be so popular as abroad. For the present, at any rate, the easily rewirable fuse, encased in some form of tube and supported by an insulating shield and handle, would appear to be the main feature of the removable "Home Office" unit of to-day; while the base unit includes some suitable protection for the metal contacts, bus-bars, &c., the whole combination making a shock-proof fuse. There are, however, many features requiring recognition and development, before we can hope to regard the question of our "Home Office" fuses with any satisfaction or credit to ourselves. Only too frequently the design of low-tension switchgear is left in the hands of junior draughtsmen, who produce interesting assemblies of detail parts, but with little regard to the functions to be performed.

Shielding of Live Parts.—The shielding of live parts is a matter provoking considerable discussion, particularly when the base contacts are in question. All are agreed upon the necessity of well shielding the hand from any danger from the handle contacts or fuse wire, and suitably shielded grips are universally provided. Opinions may differ as to the efficacy of some of the designs marketed, but the safer types of handle must ultimately prevail.

When the question of shielding the base fittings comes into consideration, we do not find the same harmony. When the switchgear is in some special position, and only accessible to duly authorised persons (*e.g.*, in "rooms, compartments set apart for the purpose"), it would appear that contact shielding may not be insisted upon, but the average board about a works, enclosed in a wood or iron case, should unquestionably be effectively guarded in every way against accidental shock.

To comply fully with the Regulations, one has to consider the fuse under all conditions. Thus, it is possible to combine the base contact shield with the handle, so that insulating shrouds carried from the handle effectively cover all live parts. If, however, the fuse handle is withdrawn, the protection to the base contacts is likewise removed, leaving the board entirely unprotected. The fact that the shields are on the handle tends to make the operator careless, and he is inclined to ignore the danger in the contacts and bus-bars. There is, further, the danger of making accidental contact with the exposed contacts when handling an adjacent fuse.

The bus-bars also require protection. Some firms fit these bars behind the fuse bases to protect them, others fit them at the front and shield separately, while still others carry them in suitable holes passing through the bases. Whatever arrangement is adopted, the danger of accidental contact should be considered, and all live metal effectively shielded as much as possible.

Other designs of fuses are rendered unsafe by reason of the fuse wire terminals on the handle being exposed, even though the base contacts may be fully protected. This not only offers a possibility of accidental shock, but by the very fact of the covered contacts and shield-handle lulling the operator into a false sense of security, offers additional danger. The risk is, of course, greater in the case of the smaller sizes of fuses with merely a finger-grip. The unused fingers curl themselves into unexpected positions, and find the live spot, if it is to be found. The solution, therefore, appears to consist in so arranging the fuse wiring terminals that no live parts can be accidentally touched by any normal individual. The fool looking for trouble with a steel rule or wire, and poking his finger down openings to see what

FIG. 1.—OLD TYPE TUBULAR HAND-GRIP FUSE, SHOWING TYPICAL FRACTURE.

end of 1908, nothing of any importance was done in the development of the "Home Office" type of fuse, until after the publication of the memorandum in February, 1910.

Prior to 1910, the tubular porcelain fuse of the hand-grip type, as fig. 1, was generally considered to be the thing in this country. In various forms, with differing ends and contacts of weird and wonderful design, it was almost universally adopted. It was a good fuse, infinitely preferable to the fuses it followed, but dangerous to handle, and with distinct limitations. The year 1910 marked its passing, or to be more exact, its development into the new fuse.

At first, manufacturers were slow to appreciate the position. A few, bolder than the rest, led the way and placed new designs on the market, and in 1910, at least six patents were taken out, on fuses specially designed to comply with the regulations and memorandum. These designs being based on the "safety first" principle, were naturally more expensive than the old-fashioned types, and therefore inclined to be slow sellers. Buyers jibbed at the price—did not recognise the necessity for "new fangled ideas"—the old style was quite good enough for them. Gradually, however, as the market became educated to the new demands and requirements, and non-"Home Office" material was being condemned, the new designs began to make headway. Other firms modified or re-designed their fuses, patent agents grew busy, and the "renaissance" became a reality.

The evolution of the new fusegear is still incomplete, but already assumes definite form in a distinctive class of "safety first" fusegear, which, in general appearance, may be said to be as essentially English as was the perpendicular architecture of the Middle Ages.

No one had recognised this change more than the German

he can find, must always expect a suitable reward for his folly.

Hot Handles.—With long-break fuses there is frequently difficulty in handling the fuse handles, owing to the excessive heat of the grip. It is hardly realised that each fuse wire is a small electric heater on its own, and, in a confined space, may heat up the handle to a dangerous degree, softening clips and burning the hands. When a man burns the skin off the palm of his hand in pulling out a fuse, or has to use cotton waste to get a safe grip, it is time that fuse was re-designed. Yet a large percentage of the present-day fuse is of that brand. If the designer had to re-wire and handle his own fuses, he would pay more attention to their cool working. It is undoubtedly necessary, therefore, in design, that the question of hot fuses that cannot be safely handled, should have equal consideration with the effective shielding of live parts.

This matter is intimately bound up with the questions of break, and ventilation of the fuse wire, both of which are dealt with at a later stage. If any doubt exists on the matter, it is always wiser to have a new design modelled by hand, for the purpose of testing the heat by actual experiment, before any expense is entailed in the manufacture of tools, &c. The Potteries are always willing under ordinary conditions, to assist manufacturers in these matters.

Fuse Break.—Passing to general questions of design. It is to be hoped that some day the Engineering Standards Committee will be able to turn their attention to the standardisation of fuse-breaks. Under the varying specifications, corporation regulations, and manufacturers' designs of to-day, we have a multiplicity of breaks for the same conditions.

Fig. 2, gives a graph showing 500-volt fuse-breaks by several of the leading British manufacturers. It will be

FIG. 2.—SHOWING 500-VOLT FUSE BREAKS BY VARIOUS MANUFACTURERS.

seen that there is a considerable variation in the lower capacity fuses, and the various makes only draw into reasonable harmony towards a 6-in. break for 500 amperes. Soaring well above the majority is plotted the Glasgow Corporation fuse-breaks.

It seems hard to realise that all these varying sizes are seriously put forward by manufacturers to perform exactly the same function. Surely it should be possible to establish some suitable standard, leaving each manufacturer to work out his own details. The circuit opening efficiency could, and should, be covered by a definite clause as to the conditions under which each size of fuse should effectively blow.

One has seen a long-break fuse deposit its fragments about the room when blown on a short test, while specially designed shorter break fuses have repeatedly snapped out the arc without the least damage to themselves. Without wishing to minimise the question of break, it has admittedly grown into a fetish with many firms, and is often used as a safety-valve for badly-designed gear.

While on this question of tests, one might with advantage give extracts bearing upon the matter of testing fuses from the rules of the American National Board of Fire Underwriters:—

(67c). Cut-outs must operate successfully on short circuits under the most severe conditions with which they are liable to meet in practice, at 25 per cent. above their rated voltage, and for link fuse cut-outs with fuses rated at 50 per cent. above the current for which the cut-out is designed, and for enclosed fuse cut-outs with the largest fuses for which the cut-out is designed.

With link fuse cut-outs there is always the possibility of a larger fuse being put into the cut-out than it was designed for. . . . Again, the voltage in most plants can, under some conditions, rise considerably above the normal. The need of a *margin* as a factor of safety to prevent the cut-outs from being run in ordinary service is, therefore, evident.

The most severe service which can be required of a cut-out in practice, is to open a "dead short-circuit," with only one fuse blowing, and it is with these conditions that all tests should be made.

(68h). Enclosed fuses must not hold an arc, or throw out melted metal or sufficient flame to ignite easily inflammable material on, or near the cut-out when only one fuse is blown at a time on a short circuit on a system of the voltage for which the fuse is rated.

The normal capacity of the system must be in excess of the load on it just previous to the test, by at least five times the rated capacity of the fuse under test.

The resistance of the circuit up to the cut-out terminals must be such that the impressed voltage at the terminals will be decreased 1 per cent. when a current of 100 amperes is passed between them.

For convenience, a current of different value may be used, in which case the per cent. drop in voltage allowable would vary in direct proportion to the difference in current used.

The above requirement regarding the capacity of the testing circuit is to guard against making the test on a system of so small capacity that the conditions would be sufficiently favourable to allow really poor fuses to stand the test acceptably. On the other hand, it must be remembered that if the test is made on a system of very large capacity, and especially if there is but little resistance between the generators and fuse, the conditions may be more severe than are liable to be met with in practice outside of the large power stations, the result being that fuses entirely safe for general use may be rejected if such test is insisted upon.

One wonders how many of our British fuses would satisfactorily comply with these regulations and tests.

(To be concluded.)

THE NEGLECT OF COMMERCIAL MATTERS BY THE ENGINEER.

By JOHN MARKS.

THE neglect of business matters by engineers in the past has had an effect on the engineering industry which is too often overlooked, especially when ways and means of setting the engineering industry more firmly on its feet are being discussed. Let us see what has been the effect on the industry as a whole, and on the electrical engineering industry in particular, of the want of business qualities in so many of our engineers.

Right from the start of the electrical industry the majority of engineers have been too much accustomed to look on the business side of the matter as beneath their notice, and this policy has had the following unfortunate effects.

The manner of financing many of the original electrical concerns was left in the hands of financial men who cared nothing for the industry, and less than nothing for either the great possibilities of the electrical industry or the benefit to the nation of its correct development. What they did care about was being able to float companies on to the general public at heavy promotion profits, afterwards taking the first opportunity to get rid of their own holdings in the various concerns.

The engineers who were financed by these people were as clever and able a set of men as any country ever possessed. In the majority of cases, however, they were purely engineers, and not business men in any way.

They conducted many and valuable experiments, but paid too little attention to getting goods delivered; often they developed personal fads, and ran these fads at the expense of the company long after other and rival concerns had produced more suitable and reliable, if somewhat less novel, designs. When profits were made, and in the early days they were made, in spite of the faulty financial management, they were too often divided up to the hilt, and little provision was made for the days when more firms would be in the field and competition would be much keener.

Assertion without facts to back it up is of little value. The writer, therefore, mentions one or two instances, with which he was quite familiar, of faulty management by clever, but non-businesslike, engineers.

One concern, some years ago, appointed a very clever and scientific engineer as its head. One of the first positions taken up by that engineer was to state that in connection with a new line then developing, he was going to make the

product turned out from that works the perfect product of its kind. A very worthy object, and one which might quite well have been attained along with commercial success if only businesslike methods had been employed.

Orders were fairly plentiful at the time, and the product of that firm was then as good as that turned out by any other firm, and the projected improvements could have been carried out on each fresh batch of machines put in hand; at any rate, that is what a businesslike manager would have done. This policy was not sufficient for the engineer in question, who actually stopped machines going out which had been tested and more than satisfied the specification under which they were ordered. No matter, they were not to go out; some detail improvement had occurred to the manager overnight, perhaps, and these machines must wait in the shops, be partially dismantled, the detail improvement fitted, and the result tested. It may seem incredible, but it is a fact that in some cases machines were tested and partially dismantled twice and three times before they went out.

Naturally, customers became first impatient, and then disgusted, and got into the habit of not expecting delivery from the firm, the natural consequence being that they placed their orders elsewhere. Unhappily, the firm had a good standard line of essential goods in the electrical world, and were, in fact, in possession of a really good paying speciality; for a time the money earned by this speciality enabled the process described above to go on without altogether upsetting the dividends.

This could not last for ever, and by the time the perfect apparatus was on the market the firm found that people had lost faith in its ability to deliver anywhere near to time; also, that other firms were then making and cutting into the market in the original special line in which the firm had done so well.

The engineer in question was disgusted to find that people would not pay an enhanced price for his apparatus, though it was undoubtedly the most efficient on the market. This extra efficiency, however, only amounted to about $\frac{1}{2}$ per cent. or $\frac{3}{4}$ per cent., and the money spent in gaining it made the apparatus unnecessarily expensive.

Had the batches of apparatus for which customers were waiting been delivered, and the improvements incorporated in the next batch made, then the same perfection could have been reached, the firm's good name and connection retained, and money brought in which would have helped to pay dividends and support experimenting as well. In fact, under such circumstances there would have been many firms ready to pay rather a higher price for the superior article. The policy which was followed upset the whole financial state of the concern and cut down dividends to vanishing point for some time.

In another case the writer saw the same idea carried out, but with regard to a different product. When the writer happened to mention to one official that money was being needlessly expended the same answer came out, namely, that the older department could earn more than the newer department could spend. Here, again, financial wreck, or something very near akin to it, resulted.

Again, in another instance, an engineer-manager not only spent a tremendous amount of capital in trying to carry out a pet theory in connection with the governing of engines, but also carried his experimenting on to the premises of the firm's clients. This process gave annoyance to the firm's customers, who pointed out that they required their engines to drive their factories. The result was not an assurance that if the various experiments were source of annoyance to the clients, the experimenting would be discontinued, but consisted of the information, conveyed in a chilling tone, that the plants belonged to the makers until the guarantee had run out, and that they (the makers) would do as they pleased. Naturally, clients fell off, the firm got into difficulties, some of the bolder spirits suggested to the engineer-manager that he should drop these costly and futile experiments, and the engineer in question promptly put in his notice and left the firm.

Now cases such as the above, which can be vouched for by many people, are by no means isolated cases; similar incidents must be known by any engineer who has spent, say, the last 20 years in the British engineering industry, and particularly in the British electrical engineering industry.

The result has been that in the British electrical industry one finds company after company which has had its capital reduced, and company after company which pays either nothing or a totally inadequate return. If every concern confining itself to the manufacture of electrical goods was in the same position, it could then be argued that there was something radically wrong with the state of the whole industry in this country. The above, however, is not the case; plenty of firms give a good return to their proprietors, and have done so for many years, though many of them started up after the first boom period had passed. In every instance, however, such firms have been sensibly managed on the business side. Their managers have always remembered that the purpose of the company was to make dividends, whether it made them on high-class dynamos or cheap rat-traps.

Now the effect on the whole industry of the financial neglect outlined in the above examples has been to cripple every electrical concern in the country. Those firms which have always paid a steady return on their capital could have either paid more in dividends, or put away money for development,

or reserve funds, in larger amounts had the badly managed type of firm been paying. Those firms who are not paying simply have to get work at any price in order to keep going. Thus, profits are cut and competition becomes exceptionally keen for all firms concerned. Naturally, capital will not flow towards an industry which is not in a healthy financial state, and here, again, the badly managed firm makes it difficult for the well managed concern to extend its works.

Another and more regrettable effect of such mistaken policy has been to cultivate in the mind of the business man the idea that no engineer ever had, or could have, any financial sense, and that it was necessary to keep a sharp eye on his little proclivity for spending large amounts of money in somewhat unprofitable ways, especially when this meant the delaying of delivery and disappointing of a customer. Consequently, all the best appointments are held by the purely business man in by far the majority of cases, and the business man, with a far less expensive or trying professional training, usually runs the engineers who are responsible for the design of plant turned out by the works, or for the maintenance of the plant necessary to operate an electric railway.

The engineer, especially the thoroughly well-trained man of about 30 or 40 years of age, complains bitterly of the fact that he is remunerated at a far less rate, worked more hours, and carries far more responsibility than his financial colleagues; yet how often do good engineers spoil themselves when a chance of showing a little commercial ability comes along.

The writer gives two instances from personal knowledge, showing different attitudes of engineers towards the business side of engineering.

A relative, who was manager at a large engineering works, prided himself on his business abilities. Quite a short time ago an engineer with ideas on the manufacture of motor delivery wagons and swift tractors was introduced to him, with a view to getting the inventor's ideas carried out and tested. Let us consider how the matter was taken up.

The statement of the relative in question was as follows:—"I could see from the beginning that his idea would hardly be likely to be a success, and that he was somewhat vague in his ideas of business, so I proposed that before we carried out any work at all we should have a definite agreement regarding all work done for him, and the payment for the same." How typically British! No tact, no idea of chatting over the matter with the inventor, who did not want for money; no suggestion here and there in order to sound the trend of his ideas on the subject, and to see whether he would be open to accept advice or not; none of this sort of work, and then a tactful allusion to the matter of payment for work done and the proposal for a regular agreement. No; a demand straight out for cash down almost, which in itself showed lamentable want of tact in that it displayed want of faith in the idea and its inventor.

The work was done, the tractor made, experimented with, and tried on various gradients, but it did not come up to the inventor's hopes. It was, after some months' trial, abandoned, and my relative then bade the inventor a friendly goodbye and putted himself on the back in that the firm had received profitable payment in full for all they had done, and there he was content to let the matter end. Asked if the tractor could have been improved, the answer was, "Oh, yes; I believe it could; there was one point in the design of which the inventor was rather fond, and which I knew would trip him up."

Now let us take the American or German engineering manager's view. The trials show that the inventor's idea is not altogether feasible, and then the suggestion is tactfully made that, if the inventor will permit, the firm will be pleased to put money into the idea, as they consider that with a little alteration the tractors would be quite satisfactory. Experiments would have followed, the design been thoroughly developed, and another paying line added to the firm's enterprises. Please observe that the mistaken policy was adopted by an engineer who thought that he was an up-to-date business man.

As a contrast to the type of engineer dealt with above, the writer was pleased to meet and entertain, a short while ago, the manager of a large constructional firm; their business is not electrical work, but the lessons to be learnt from this engineer's policy are of value to any engineer, electrical or otherwise.

Naturally, talk drifted to prospects of business when peace shall be declared. The opinion was then expressed by the writer that first-class business and technical organisation would be more than ever necessary to obtain any success worth having.

The engineer in question stated that his own opinion was that in the days to come business would be most effectively obtained by what he was pleased to term first-class and intensive advertising, followed up by representatives possessing strong personalities. Amongst the greatest of their assets he rated tactful handling of possible customers, and also called for a thorough understanding of the technical points of the work in question. He stated that he had difficulty in getting good engineers who were tactful representatives, or good representatives who were acquainted with their products from A to Z. The writer happened to draw his attention to the disparity usually existing between, say, the managing engineer's salary and position and that of the general manager of a business, pointing out that the latter was generally much

better remunerated, and had had a much inferior education and training to that of the engineer.

The engineer in question admitted the disparity in emoluments, but insisted that it was no more than fair, his statement being that the man who managed the concern in such a manner that it earned a good dividend was not only providing the possibility of a good and also improving position to those on the staff, but, by tending to bring further capital into the industry, was benefiting the whole community. He stated that at an early point in his career he had resolved to get the controlling position of some business before he reached 35 years of age; that he went into the shops during his practical training with the idea of one day selling the goods; that when he got into the drawing office he meant having the position of leading draughtsman as soon as it was available. Having, after a few years' hard work, attained that position, he realised that, much as he liked the engineering side of the business, something more was required of a man who aimed at holding the reins. With that end in view, he took every opportunity of influencing business for his firm, and when sent out to try and talk over possible clients on subjects of a technical nature, used the utmost tact of which he was capable. The result was that he attained the position of deputy-manager, and finally of general manager.

"Now then," he observed, "I am a much better man than the technical man alone: I not only help to arrange the designs, but annually get thousands of pounds' worth of work for the firm and all connected with it. Take my leading draughtsman, a splendid fellow, a first-class man whom I should be sorry to lose. I can't promote him to be an outside representative or my deputy; if ever he goes out to see about a contract, or any proposed work, there is always a Dickens of a row to follow, and a possible loss of a customer. When possible clients make statements which are wrong fundamentally, he contradicts them and tells them that they do not know what they require; the proposed client gets in a huff, snaps back, and my leading draughtsman then shows the client in plain unvarnished terms that he does not know anything about the matter at all, and is a very poor sort of person when considered alongside an engineer. When spoken to about making such a hash of things, and counselled to be tactful, he retorts that he cannot, and will not, be told what is correct by a non-technical man. On the other hand, when I get that type of customer I handle him gently, find out his pet idea, and then gradually work him round by letting him think that I agree with him, until he comes somewhere near to a correct view of the case. This may take me an hour or more, but sooner or later I convince him by quiet, reasonable, and friendly conversation that the only way in which to carry out the work is the way our firm does it." The above policy may seem obvious, but how often is it carried out by engineers in a managing position? Too often the tendency to become dictatorial, and even testy, with a customer is considered to be quite a correct attitude.

The directing of a great business is like unto the conducting of a great orchestra; the engineer in an engineering concern is certainly the most important instrument; but as the purpose of an orchestra is to interpret some great musical work in a perfectly harmonious fashion, so is the purpose of an engineering business to earn a return on its capital. In the one case, neither the leading violin nor the 'cello player is permitted to display his own talents in such a manner as might endanger the production of the masterpiece; nor can the engineer be permitted to indulge his own fads if it means interference with dividend production. Both men must obey the man who organises the whole process in such a manner that the desired effect is produced with harmony.

In both cases there must be a conductor who will balance the efforts of each separate player or department; and in both cases the talent required for this conductor is not proficiency of an extraordinary degree in any one line, but capacity to organise other people's work, in order that a desired result may be attained. If the engineer is to rule in an engineering concern, then he must be something besides an expert engineer; he must be able so to conduct the firm that the desired end, dividends, is attained, or make room for someone else, who may not be an engineer, but who is a successful organiser and director of other people's efforts.

Let us keep an eye on our competitors, especially those from enemy countries; but let us not forget the severe handicaps which our own mistakes of the past have imposed on us. By so doing we shall be in a stronger position than ever to meet both our competitors and our shareholders.

THE INSTITUTION OF ELECTRICAL ENGINEERS AND ALIEN ENEMY MEMBERS.

As briefly stated in our last issue, the special meeting of corporate members to consider a resolution altering the Articles of Association was duly held on Wednesday last week. Owing to the difficulties which arose in the course of the discussion, the resolution was not put to the vote, and it was decided to call a fresh meeting to consider the whole question untrammelled by the restrictions which, as explained below by "W.B.E.," necessarily tied the hands of the meeting. No

time was lost by the Council, the meeting being called on Wednesday this week; the result will be found in our "Notes" columns to-day.

The following is a brief account of the proceedings at the first meeting:—

The President, Mr. C. P. SPARKS, explaining the object of the meeting, said that for some time after the Council had stated in the *Journal* what powers it possessed to deal with alien enemy members, no action was taken on the part of the members to put Article 41 in operation. Eventually, however, a petition was received, signed by 17 members, and the Council, after consultation with a deputation, had called a meeting in accordance with the Articles of Association, with the resolution [printed in our issue of February 1916, p. 206] modifying Article 41, and providing that any member who during war should be a subject of an enemy country should cease to be a member of the Institution. Moving the resolution, the President called upon Mr. C. ALBERT FAIRBANKS, who, in seconding it, read a letter which he had addressed to the *Electrical Review* [December 31st, p. 831], containing the substance of the petition. Since followed, and he found no difficulty in obtaining signatures to a petition—he could have obtained 170 if he had so wished. At a conference with the President the form of the resolution was agreed upon, on the lines of a similar resolution adopted by the Iron and Steel Institute, and the meeting followed. The petition did not touch the question of naturalised aliens at all; they could not deal with any of those unless they dealt with all—and some of them had some claims for us. The resolution, however, covered the case of aliens who had not denaturalised themselves in their own country, who should be excluded.

Mr. A. GAY referred to a letter which he had written to the President with regard to the procedure to be followed, and to amendments which he had forwarded, and the President replied that he was advised by the honorary solicitor that the amendments were not in order, whereupon Mr. GAY strongly protested, and urged that according to the rules and rules of debate a relevant amendment must be in order.

Mr. C. C. ARCHISON thought the meeting would be limited if limited to the resolution, and questioned whether a meeting held in London could be representative of the whole country; he held that every member should have an opportunity of voting. He considered that it should not be necessary for the members to act in such a matter—it was the duty of the Council to ascertain the feeling of the members and to take action accordingly. The resolution, in his opinion, did not go far enough, as it would not prevent alien enemies from rejoining after the war.

Mr. GAY moved the adjournment of the meeting until the holding of a postal ballot on the resolution and amendments, but the President refused to accept the motion, upon which Mr. GAY protested that the whole of the proceedings were irregular.

Mr. F. C. RAPHAEL suggested that the resolution should be passed unanimously, and that afterwards the proposed amendments should be considered.

The President pointed out that any proposed change in the Articles must first be submitted to the Board of Trade for approval.

Mr. W. B. WOODHOUSE said he would support the resolution on the understanding that aliens who had not tried to denaturalise themselves would be expelled, and Mr. E. H. DEXCAN, whilst suggesting that each case of alien membership should be dealt with individually, thought they should wait for the Institutions of Civil and Mechanical Engineers to lead the way.

The President refused to be guided by any other body, and pointed out, with regard to the question of naturalisation, that British law prevailed over German law in this country, so that naturalised aliens would not be touched by the resolution; but it would still be possible, under Article 41, for members to take action with regard to any individual case. As for re-election after the war, that would be in the hands of the members themselves.

Mr. A. A. CAMPBELL SWINTON feared that the interpretation of the law with regard to aliens naturalised, but not re-naturalised, altered the conditions very much, and several members who were in favour of the exclusion of alien enemy members, including Mr. G. W. Partridge and Mr. J. H. B. declared their intention of voting against the resolution, which would not have the effect of excluding this class.

Suggestions to modify the wording of the resolution, and to adjourn the meeting, having been rejected by the President, Mr. L. L. ROBINSON proposed that the resolution be referred back to the Council and brought forward again in a form which could be amended so that it would be a resolution of the Institution and not of the Council. It was pointed out that the resolution ought not to be negative, as this would produce an erroneous impression outside the Institution, and eventually the President, remarking that the matter was of very great importance, announced that the resolution would not be put to the vote; a new meeting would be called, in which the various proposals could be fully discussed, and the final decision would be submitted to the Board of Trade for approval.

The meeting at the Institution of Electrical Engineers 1st inst. was extremely interesting, as revealing and exposing the misconceptions which exist amongst professional engineers—often business—engineers regarding business methods.

After the resolution with which we are all familiar was proposed and seconded, Mr. Gay charged in with the question as to whether the proceedings were to be conducted according to the recognised rules of debate. The obvious answer would have been: "This is not a debate, but a meeting of a public company convened for a specific purpose, viz., to pass, if thought fit, a resolution altering its Articles of Association. You are at liberty to discuss the resolution on its merits; if you are in favour of it pass it, if you are not in favour reject it, but there, so far as this meeting is concerned, the matter ends." Why this answer was not given clearly and directly I am at a loss to know; it would have saved much in talk, though, of course, we should have lost much in entertainment.

Mr. Gay wanted to propose amendments, and mentioned the Mayor of Islington as authority that his proposals were in order. This did not necessarily prove that the Chairman's ruling was wrong; it might only prove that the Mayor of Islington knew no more of company procedure than Mr. Gay! As a matter of fact, his confusion is easily understood. If the occasion had been a meeting of the Institution as an institution, the members would have been at liberty to put forward any amendments they pleased, but it was a meeting of the Institution as a company, consequently the proceedings had to be conducted in strict conformity with the Articles of Association. There was no use in badgering the President. He didn't make the laws governing public companies, and he didn't make the Institution Articles; in short, he had in this particular case no option.

In submitting the resolution, the Council had undertaken a thankless job, and the meeting showed little appreciation of their efforts. But, really, they had some justification for their action. Seventeen members, as I understand it, brought the question of expulsion of enemy aliens before the Council. Meetings and negotiations took place. A proposal as to how to deal with the question was drafted by the group of members. The Council could not agree with that altogether, but intimated that with some alteration they could give it their whole-hearted support, and that a definite proposal could consequently come before a meeting with all the weight of the Council behind it. All right so far, but, alas! for the next stage. Instead of bringing this proposal or some resolution embodying it before the Institution, to be talked thin "according to the recognised rules of debate," assuming that there would be no opposition, they determined to alter the Articles of Association right away, and called a company meeting for the purpose. Their assumption was false. The subject is highly contentious, and a general debate at another meeting is to take place, after which the mangled remains of the various resolutions and amendments proposed may serve to indicate the lines on which a resolution can be drawn amending the Articles. In not submitting a resolution to the Institution first the Council were guilty of an error of judgment; that is all. But what were the Council thinking about to have made such a mistake?

The resolution seemed as clear in its meaning as language could make it. I very carefully considered the wording when the notice of the meeting reached me, and decided to vote for it. It appeared quite free from ambiguity, and my view was evidently that of Messrs. Baker, Swinton, Rider, Atkinson, and many others present. It was clearly stated that enemy subjects should cease to be members of the Institution, and with this I was well content. But, unfortunately, the President told us that the interpretation of the resolution was a question of law, with which statement I entirely disagree. As the wording stood, it was not a question of law at all, but a question of fact, and the fact is that until an enemy Government has released its subject from his obligations to his country of origin, he continues to be an enemy subject, and this whether we take him to our hearts by naturalisation or not. The latter event makes no difference at all, because it is not recognised by the enemy Government. It is true that, in the absence of release from his continuing obligations, the return of an enemy subject to his own country might imply his being imprisoned or shot, which would possibly bend his sympathies in the direction of the country of his adoption; but, nevertheless, he is still an enemy subject, and consequently, by the wording of the resolution, he is got rid of. Do the Council mean this, or do they not? If they do, let them say so clearly and put forward a resolution worded so that there can be no hedging behind legal argument. If they do not, they unconsciously deceived the men who went to the meeting to vote for the resolution, and in this case also a new wording will be necessary. Evidently, so far as our present Council are concerned, clarity of thought does not march with technical attainment. W. B. E.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

15,000-KW. Generator for Manchester Corporation.

In the "Contracts Closed" column in your last issue, a reference is made to the transfer of the order for the above machine from us to the British Westinghouse Co., and as the bald statement of this fact in times such as these might be misunderstood by your readers, we should be much obliged if you would allow us to point out that the change in the contract—which has been made by friendly arrangement between the parties—is simply due to submarine risks in sea transit, it being imperative in the national interests that this plant shall be ready for running by March, 1917.

Mr. Pearce has authorised us to state that this action is not in any way due to technical or political reasons, but has been determined solely having regard to the serious risks attendant upon the delivery of goods by water during the period of hostilities.

Brown, Boveri & Co., Ltd.

A. C. EBORNT, Managing Director.

London, S.W., March 3rd, 1916.

City Guilds' Subject: "Electric Wiremen's Work."

I have read with interest the letter under the above heading from Messrs. A. P. Lundberg & Sons. The most important feature missing from the letter is the fact that the classes do not attract the men engaged in this section of the electrical industry. The bulk of the students with whom I have come into contact are invariably engaged in occupations outside the scope of electric wiremen's work.

There are indications of considerable modification in the subject matter of the syllabus, which, it is hoped, will bring the tuition in the classes into line with the requirements of so-called "wiremen," and thereby encourage larger classes and more candidates in the examinations.

In addition, electrical contractors should interest their employees in technical training and the advantages appertaining thereto.

W. Ellerd-Styles.

London, W., February 29th, 1916.

What is an "Electrical Contractor?"

Your correspondent "Contractor," on page 251, complains of consulting engineers who, while doing their best for their clients, do not assist "electrical contractors," which, in this particular case, seems to mean "wiring contractors"; but what right have such contractors to supply engines, dynamos, and plant they do not understand?

Is "Contractor" himself an engineer or electrician? If so, then he is an exception, and he should advertise his qualifications so that consultants may avail themselves of his assistance. Any man may dub himself "electrical contractor," though knowing nothing of electrical work, and not making any of the apparatus he uses; even the wiremen he hires have been trained by others; and he feels aggrieved if he does not get a middleman's commission on everything!

I have had 35 years' experience in this particular line of work, so I know what I am talking about.

Facts.

Cause of Flicker.

Mr. Bulsara's trouble with light flickering seems to me to be due to a broken earth return somewhere or other. The fact of the trouble being present with any of the generators running proves to me that the fault is either close to the switchboard or beyond it in the lighting circuit wiring. The vibration of the engines running is disturbing this broken earth wire more or less, according to the proximity of the engine to the fault.

I rectified a similar fault a short while ago in a lighting circuit on a 3-wire D.C. system, 230-460 volts. The fault had been on for two years, and was only noticed when the main middle-wire fuse blew. From this time onwards an occasional nasty flicker was observed in a certain circuit; the switches acted all right, but the withdrawal of the fuse did not affect the circuit at all. I knew then that I was getting light through the earth return of the conduit, which was being vibrated at times by the engine working close by and sometimes breaking the circuit.

Eventually, I opened out the faulty circuit and found the return wire trapped in the angle of a split elbow, and making a lovely contact thereto. If Mr. Bulsara's trouble is something like this he will find some fault on the earth return or middle-wire cable.

It cannot be on the cutters, which are both above earth potential by 230 volts or more in his case, and would certainly blow the fuses. I should advise Mr. Bulsara, if the fault is only on a certain section of lighting, to have the return cables tested for an earth leakage.

Wages at Greenwich Generating Station.—The I.C.C. Highways Committee has received a petition from certain employees at the Greenwich generating station for an increase of wages, and also an application for increased pay for overtime. The Committee reports that the question of the wages of these employees was settled by arbitration in June, 1915, and it is of opinion that they are not entitled to have their wages reconsidered by the Conciliation Board until June, 1916. As regards the application for increased pay for overtime, the Committee recommends that it be referred to the Electrical Conciliation Board.

If the fault is on every light in the place, then the main middle-wire cable is faulty at some point or other beyond the switch-board bus-bar connection, and should be tested out for earth leakage. If the fault were traced to valve trouble in each engine it would constitute a record fault, I think.

I should be glad to know the ultimate death of this fault, and hope Mr. Bulsara will acquaint the ELECTRICAL REVIEW when he finds it.

Hy. Fowler,
Electrician.

Liverpool, March 2nd, 1916.

Concerning Discounts.

In the interesting communication on the above subject your correspondent says: "Just why makers do this kind of thing it is not easy to understand." But the reason is not far to seek. Invoice clerks, and, indeed, most people who have the making up or checking of invoices, know nothing of "decimals," which they regard as a mysterious arithmetical process, which only schoolmasters and scholars, who have devoted their lives to the subject, can possibly understand. The invoice clerk works with a book of discount tables, and as these are made up for discounts of 11, 2½, 5, 10, 15 per cent. and so on, the reason for the imposing array of discounts is obvious.

It is rather odd, however, that cable makers and other jugglers with discounts have not heard of the marvellous discovery made by some brilliant genius in the tube trade (or is it the file trade which has the honour?). The tube makers use a standard list for all classes of tube, and different discounts are quoted for steam, water, and gas tube, &c. The discounts are single figures like 57½ or 62½, and so on. But the discount tables do not give discounts like these, so what is the invoice clerk to do, poor thing? Well, after a little instruction and a lot of hard thinking, it dawns on him that 62½ per cent. discount, for example, is simply 50 per cent. of the list price, plus 10 per cent. of the list price, plus 2½ per cent. of the list price, or 12s. 6d. per £1. The arithmetical genius simply takes 62½ per cent. off list = list × (100 - 62½/100) = list × .375 or list × ¾. Thus does the wily tube maker win the esteem of the scholar and the plain clerk alike, "two at a blow."

The tube maker's method has a decided advantage in this respect, that all discounts are calculated on the list price, which is generally a round sum in pounds or shillings, or pence with no fractional parts. Compare the following:—

CABLE MAKER'S METHOD.	TUBE MAKER'S METHOD.
List £146, less 25, 15, and 10 p.c.	List £146, less 42½ p.c. Using discount tables.
Less 25 p.c. £36 10 0	20 p.c. on £146 = £29 4 0
Less 15 p.c. 109 10 0	20 p.c. on £146 = 29 4 0
Less 10 p.c. 16 8 6	2½ p.c. on £146 = 3 13 0
93 1 6	Total discount £62 1 0
Less 10 p.c. 9 6 2	£146 less £62 1s. = £83 19s.
Net £83 15 4	net.
	Another way is to take off 8s. 6d. per £1.

The slight difference in the results obtained is, of course, due to the fact that 25, 15, and 10 per cent. is equal to 42.625 per cent., or .125 more than 42½ per cent.

I think that this is a most opportune time to invite discount jugglers to mend their ways and "put away childish things," and I suggest that the ELECTRICAL REVIEW should take this matter up vigorously and now. If we are to compete successfully with our enemies after the war is over, we must "lay aside every weight."

"A Station Engineer" deserves a hearty vote of thanks for bringing this question up; we have suffered too long under the yoke of the discount designer.

John W. Black.

Glasgow, March 6th, 1916.

An Engineer's "Wages."

May I draw your, and other people's, attention to the first advertisement in the current number of your paper under the heading of "Situations Wanted"? It seems to me that the rate of remuneration for technical men is poor enough already, and advertisements such as this do not tend to improve matters.

If any firm can get the services of a well-trained engineer for "low wages," why should they pay high, or even moderate, salaries? Is it lack of *esprit de corps* that is responsible, to a great extent, for advertisements of this kind?

There is one advantage of trade unionism which might be applied to engineers here illustrated.

Ealing, March 6th, 1916.

Disgusted.

The I.E.E. and Alien Enemies.

From the feeling expressed at last night's Institution meeting, I am sure that no mere form of words will satisfy the general mass of members which does not render the exclusion

of the German after the war total and (as far as is humanly possible) permanent.

This point I endeavoured to make in the following letter to the Council, the publication of which should now be no breach of confidence.

W. P. Anderson.

The Council of the
Institution of Electrical Engineers, London.

I.E.E. and ALIEN ENEMIES.

GENTLEMEN,—I am in receipt of your post-card of the 15th inst. With regard to the matter contained in it, perhaps I may be permitted to express my own personal view, which I know to be shared by a large number of your members in the North. This view is that the resolution has been drafted on wrong lines, in that, although we are logically quite safe from the intrusion of Germans at our meetings throughout the duration of the war, we are not protected from their becoming members after peace is declared.

There is little doubt that German commercial men will make a superhuman effort immediately after the war to regain their footing in our social and industrial life, using the membership of our clubs and institutions as a lever to that end; and that they will be successful in this aim in the course of a few years is more than probable, our national characteristics being what they are.

May I suggest, therefore, that a new resolution be framed making it impossible for any member of this race to join the Institution after the war? I fully realise that no rule can be made to hold "in perpetuity," but he will be a bold man who in the next 50 years attempts to rescind such a resolution passed now. Surely, also, partial achievement is better than the making of no attempt.

I would make the resolution I propose apply to Germans whether naturalised or unnaturalised (if legally possible), the former, in my opinion, being much the more dangerous of the two.

As indicative of local feeling here, I would say:—

1. That the rules of the Engineers' Club, Manchester, have been so altered that no present alien enemy can, in future, enter the Club either as member or guest.

2. That the City Corporation has placed upon its standing orders a resolution prohibiting the purchase of German machinery out of the public funds.

There can be little doubt that these steps will be of a most far-reaching character.

I have purposely only confined myself to the German, and would make it clear that the proposal is put forward not because he is our enemy, but because he is, and must be made to remain for many years to come, a social outcast with whom one cannot treat as with an honourable foe.

While extremely unwilling to be a party to any policy which might be considered undignified, I would make a strong appeal to you, as members of the Council, to give the above matter your very earnest consideration.

Yours faithfully,

W. P. ANDERSON, Member.

Manchester, February 21st, 1916.

Decimal Coinage and the Metric System.

I have been following your articles on the metric system with great interest, and, although it may seem like flogging a dead horse, I should like to point out that the introduction of anything metric at home and in the Colonies would be enormously to the advantage of British trade and intercourse generally with Netherlands India.

When the war is over and Germans realise that they are no longer welcome guests in British countries, they will probably swarm to this country, so that everything possible should be done to enable British firms to compete with them.

In addition to the many examples you have given of the advantage of using the metric system, permit me to point out that when using the Vernier. Take an example with the very common form of sliding callipers engraved with inch and metre scales. On the former 7/16 in. is divided into 8 equal parts, so that each division is 7/128 in., on the latter 9 mm. is divided into 10 parts, so that each is 9/10 mm. I put the callipers on my ruler and, finding that the reading is something more than 28 mm., run my eye along the scale, and, finding alignment at the third Vernier division, write down 28.3 without the slightest mental effort or delay. When I look at the inch scale, however, I find 1 1/16 in. with alignment at the seventh Vernier division, so that I have to write down 1 1/16 in. plus 49/128. Need I say any more?

Only a few days ago a gentleman who represents a very important American firm, and travels all over Java, told me that he was convinced that British firms had lost their hold on the trade greatly through their representatives and travellers not being able to speak Dutch. Now I do not suppose that many young Britons will learn this language, but there are plenty of young men in Holland who would be only too glad to work for a time in British factories so as to perfect their knowledge of English and learn British methods of business. There should be no great difficulty in attracting such young men, and as many of them would afterwards naturally gravitate to Netherlands India, even if it were not worth while to send some of them out in the interests of the

rooms for whom they had worked, they would be of great use in putting British goods of all sorts.

The following experience of my own may interest you: The chief engineer of a sugar factory saw the catalogue of a British firm dealing in small tools on my table, and asked me to order some for him. He made a list of what he wanted with the prices, which, to save me trouble, he kindly added up, making a total of something like £2:23s:17d. The scale with which I greeted this was perhaps in rather bad taste, but it was nothing to what he said about our monetary system.

I have written the above in the hope of advancing, if ever so little, the introduction of the metric system in British countries, and leave it to you to make such use of it as you may think fit.

C. H. Pownall.

Banjowangi, Java, January 6th, 1916.

Mr. Trotter's Recommendations for Feeder Pillars.

Mr. Trotter's recommendations for feeder pillars appear to be very difficult to carry out in many cases. It would meet his requirements if the carcass of the pillar was made of wrought-steel or cast-steel.

It is a well-known fact that cast-iron will fly into pieces if struck a severe blow, but either wrought or cast-steel would be free from this defect. Indeed, it seems likely that the lastbourne accident would not have had serious results if the pillar there had been of cast-steel.

The opinions of other engineers on this question will be interesting.

Feeder Pillar.

WAR ITEMS.

Australia and Enemy Holdings.—Statutory Rules, 1916, No. 13, made January 29th, under the Australia War Precautions Act, require:—

All naturalised persons of enemy origin, unless exempted by the Attorney-General, and all enemy subjects, to transfer to Public Trustee, before April 16th next, shares held by them in companies incorporated in Australia.

Public Trustee to be appointed by Government and to have authority to hold shares for twelve months after end of war, or to sell them at the request of transferor or by direction of the Attorney-General.

Proceeds of sale of shares to be paid by Public Trustee to transferor, unless Attorney-General otherwise directs, dividends or shares transferred to Public Trustee or held by enemy subjects to be paid to Public Trustee, and dividends on shares of naturalised persons to be paid so if Attorney-General requires.

Applications from naturalised persons to be exempted from regulations require to be made in writing to Attorney-General, accompanied by statutory declaration giving full particulars of name and address of place and date of birth, parentage, and occupation of applicant, and setting out list of names of companies in which he holds shares, number and value estimated of shares, and ground upon which application based.

The Attorney-General has absolute discretion to deal with applications as he thinks fit.

As to calls on shares transferred, the regulations provide that the Public Trustee may, at request of transferor, and, if directed, by Attorney-General, shall pay calls out of funds supplied by transferor, or out of proceeds of sale of some of his shares.

After the date of regulations any enemy subject, and any naturalised person of enemy origin to whom exemption has been refused, who sells or otherwise disposes of his shares to any person other than the Public Trustee, and any person who buys shares from any enemy subject or any such naturalised person, shall be guilty of offence against the Act, and the sale or transfer shall be void.

Naturalised person of enemy origin means person who having been subject of country with which United Kingdom is now at war is naturalised British subject by virtue of certificate of naturalisation issued in any part of British Dominions to himself, father or mother, or, in case of married woman, to her husband, and includes the wife of any such naturalised person.

The regulations apply to London Register, Australian Companies, equally with Australian Register.

Exemptions.—The Swinton and Pendlebury Tribunal has granted total exemption to one of the attendants at the Swinton substation of the Lanes, E.P. Co. The attested man, it was stated, ought to be badged with the rest of the company's workers, but was under the military age when the badges were supplied. Attendants at generating stations were in a reserved trade. Mr. Purritt, for the company, said he himself was doing the work of about six people, and he had had to get five men back from the Army to their employment. If the employee now appealed for were taken he did not know how the electricity supply of the district could be continued.

Temporary exemption has been granted John Gibson Grimes, whose exemption was applied for by the Windermere Electricity Supply Co.

At the Woolwich Military Tribunal last week an electrical firm applied for exemption for a specialist in automatic telephony. It was stated that this was not a reserved occupation, but in order to obtain his present position this man had had to undergo the training of certain reserved occupations. Formerly the firm had ten of these automatic telephone specialists, but seven had already gone, and the remaining three were absolutely indispensable. The firm had established three automatic telephone exchanges, and if anything went wrong these were the only men who could put it right. The certificate was granted conditional upon his continuing in the same occupation.

Portsmouth Tribunal on Saturday exempted an electrician employed by the Clevedon, Portsmouth and District Electric Light Co., who was stated to be the only skilled employee left, and whose services were necessary for the running of the plant.

Trading with the Enemy: An Australian Action.—We read in the "Melbourne Age," for January 20th, that a High Court writ has been issued on behalf of the Welsbach Light Company of Australia, Ltd., of Melbourne and Sydney, directed against the Commonwealth of Australia and the Federal Attorney-General. The writ claims:—

(a) A declaration that the Trading with the Enemy Acts are *ultra vires* of the Commonwealth constitution, or, in the alternative, that section 2, sub-section 2 (b) of the first Act is *ultra vires* of the Commonwealth constitution.

(b) A declaration that the proclamation of his Excellency the Governor-General, dated July 7th, 1915, pursuant to the Act, is unlawful.

(c) A declaration that the notice dated September 18th, 1915, declaring the plaintiff company to be, in the opinion of the Attorney-General of the Commonwealth, managed or controlled, directly or indirectly, by or under the influence of, or carried on wholly or mainly for the benefit or on behalf of persons of enemy nationality, or resident or carrying on business in an enemy country, is unlawful, and is also contrary to fact.

(d) An injunction restraining the further publication of the said notice.

The case was expected to come on for hearing before the full bench of the High Court in Melbourne last month.

German Press Campaign in Spain.—We have received the following communication from Mr. R. M. Nosworthy, president of the British Chamber of Commerce for Spain, Barcelona:—In view of the powerful and unscrupulous press campaign which is being carried on in this country by German and pro-German interests, the British Chamber of Commerce for Spain is strongly of the opinion that a combined effort should be made at once to counteract it by an efficient means at our disposal, viz., by bringing pressure to bear on Spanish newspapers by the organisation of British advertisers. Such organisation is intended to serve two objects: (1) The advancement of British commerce in Spain. (2) The well-merited support of those newspapers and periodicals which have declined to sacrifice their sense of truth and justice to the pressure of the German Press Bureau. Great Britain has already a large export trade with this country, but it might be considerably increased by judicious press advertising, which phase of commercial activity is still in its infancy in this country. This Chamber is of the opinion that a well-organised advertising campaign on behalf of British productions would certainly meet with immediate success, and this must apply especially to the ever-increasing number of proprietary and household articles of daily use. A special committee of this Chamber has been formed to deal with the subject on the following lines:—

1. Advertisements should be inserted only in those newspapers and periodicals free from German influence.

2. A list of the most influential newspapers and periodicals in Madrid, Barcelona, Seville, Bilbao, and other centres in Spain, with their tariff for advertisements, will be compiled and sent to advertisers on application.

3. The British Chamber of Commerce for Spain, having the placing of a large number of advertisements, may be able to obtain specially advantageous rates, rebates, and discounts, the benefit of which will be given to advertisers or their agents.

4. This Chamber will, if desired, undertake the translation of advertisements into Spanish, and their publication, free of charge.

5. Firms which prefer to leave their advertising to local agents should instruct them to patronise only those newspapers recommended by the British Chamber of Commerce.

Applications should be addressed to the Secretary, Advertisement Committee, British Chamber of Commerce for Spain, Plaza Cataluña 9, Barcelona.

Congestion at Havre.—The Commercial Intelligence Branch of the Board of Trade is informed by the Foreign Office as follows:—The French Government desire it to be known that the port of Havre is much congested, and it is consequently desirable that British exporters of goods for Switzerland should send, in their own interests, as little as possible by this route for the present; meantime efforts are being made to relieve the congestion.

Nottingham Corporation Contracts.—The Nottingham Corporation has unanimously decided to support the Manchester decision that no public contract shall be entered into with any body of German or Austrian nationality.

Controlled Works.—The number of controlled establishments is now 3,052.

German Trade Preparations.—The French Minister of Commerce and Industry has just communicated to the French Chambers of Commerce the intimation that, according to information received from authentic sources and supplied to his department by the Minister of War, Germany and Austria-Hungary are engaged in laying down stocks in America of certain classes of merchandise of prime necessity under the conviction that after peace is declared there will be a great demand for them, and consequently an enhancement of prices. These stocks will be held until the end of the war owing to the present difficulty of shipment. Among the goods scheduled for these manipulations are:—Wool, lard, animal fat, copper, tin, raw rubber, tires, cottons, oil, vegetable grease, soap, and woven goods. The Minister adds that he deems it needful to signalise these preparations, so that French commerce and industry may take measures to guard against being forestalled in connection with the products mentioned. It is, of course, obvious that copper, tin, rubber, and oils and grease are products in which the electrical industry have an interest.

War Trade Department.—Mr. W. C. Bridgeman is acting as assistant director of the War Trade Department, and will continue to represent the department in the House of Commons.

LEGAL.

MORSEHEAD v. QUASI ARC WELDING CO., LTD.

A CLAIM by Mr. L. R. Morsehead, an engineer, against defendants, electro-metallurgists, Caxton House, Westminster, came before Mr. Justice Darling and a special jury, in the King's Bench Division on March 2nd. The plaintiff claimed damages for alleged wrongful dismissal from his position as technical representative. Defendants, who are the owners of patents for a special method of electrically welding metals, pleaded justification on the ground that they were dissatisfied and, in reply to that, Mr. Morsehead contended that such dissatisfaction was unreasonable.

The jury eventually returned a verdict for the defendants, and judgment was entered accordingly, with costs.

Counsel for the plaintiff asked for a stay of execution with a view to a possible appeal, but this was refused.

ELECTRICAL ENGINEER'S LIBEL SUIT.

In the King's Bench Division, on Tuesday, before Mr. Justice Ridley and a special jury, Capt. Herbert Wm. Lowe, of Cricklewood, sued Mr. C. J. Weld Blundell, of Lulworth Castle, Wareham, for an alleged libel. Defendant did not admit publishing the libel. The letter complained of was written on a privileged occasion, and was *bona fide* and without malice.

In opening the case, Mr. LEWIS THOMAS, K.C., stated that plaintiff was now a captain in a Warwickshire Regiment, and had been for 18 months in the trenches. Plaintiff was an electrical engineer. In 1911 he was approached by a friend of defendant's to undertake the management of the Float Electric Co., Ltd., in which Mr. Blundell was the largest shareholder. The company was engaged in the manufacture of a patent safety electric lamp. According to the agreement defendant was to find sufficient capital to enable the business to be carried on. There was a difficulty owing to sufficient capital not being provided by the defendant. Plaintiff eventually resigned his appointment, and his resignation was accepted. He received his commission in November, 1914. In July, 1915, on returning home, plaintiff found that defendant had been making certain reflections on his character. After a new manager had been appointed to take over plaintiff's work, defendant wrote a letter to Mr. Stephens, his accountant. This communication referred to the new manager, and stated:—

But my experience with workmen is that they all follow exactly the tricks and rogues of their predecessors, and his predecessor, Lowe, an ingenious thief, with the help of the rest of the gang—managed by just the same manoeuvres and pretences to get £1,000 or £3,000, and—sheltered him completely and pretended that the money had been fairly used in trading transactions.

Plaintiff gave evidence in support of Counsel's statement.

Mr. Charles Comins, chartered accountant, 50, Cannon Street, E.C., was called to show that the balance-sheets and accounts of the company were accurate.

Mr. MITCHELL INNES, K.C., for the defence, stated that there was no evidence of publication. The letter was addressed to Mr. Stephens, who had acted as defendant's accountant. He also contended that the letter was written on a privileged occasion. It was addressed to an accountant whom defendant had consulted for the purpose of guidance and information.

The Jury, having briefly deliberated, returned a verdict for plaintiff, assessing the damages at £1,000.

Judgment was entered accordingly, with costs. A stay of execution was granted with a view to an appeal.

Sweden.—It is announced from Stockholm that the Allmänna Svenska Elektriska Aktiebolag has acquired the majority of the shares of the Nya Forenada Elektriska Aktiebolag, of Ludvika.

BUSINESS NOTES.

Consular Notes.—SIAM.—The American Vice-Consul at Bangkok reports a demand for electric motors, tramcar equipment, telephone and telegraph supplies, X-ray apparatus, electric fans, bells, batteries, and a variety of similar goods. Bangkok is at present the only city in Siam supplied with electric power for industrial purposes. It has two electric light and power plants—the Siam Electricity Co., Ltd., a private company, and the municipal light and power station, owned and operated by the Siamese Government. Particulars of these undertakings have appeared in our pages.

CHILE.—According to a report from the American Commercial Attaché at Santiago, two new electrical companies have been floated in Chile. The Compania Eléctrica Canpolican, Rengo, Chile, has been organised, with a capital of 800,000 paper pesos (about £27,000), to take over certain electrical machinery already installed, and to purchase the concession for lighting the towns of Rengo, San Fernando, Rancagua, Peumo, San Vicente, and eight others. La Compania de Luz Eléctrica de Constitución has been floated with a capital of 60,000 Chilean paper pesos (about £2,000) for lighting and providing power to the town of Constitución, located in the Province of Maule, on the coast. Constitución has a population of about 6,500, and is a popular seaside resort.

COLOMBIA.—The Colombian Congress, according to information supplied by the American Consul at Barranquilla, has appropriated \$5,000 for the purpose of establishing an electric light station at Puerto Colombia to supply that village and the railway and steamship pier with electric light. In consideration of this sum the authorities of Puerto Colombia will be required to supply lights free for 10 years to the coastguard, post office, and telegraph offices, and one searchlight of 2,000 C.P., or two of 1,000 C.P. for use by the coastguard in lighting the bay for police purposes. The surveys and plans are under way. American machinery and equipment are to be installed.

ECUADOR.—The American Consul-General at Guayaquil states that, notwithstanding the fact that several contracts for the construction of the Esmeraldas-Quito Railway have been entered into between the Government and different parties, none of which have ever been fulfilled, another project was recently laid before Congress, and accepted, providing for an electric railway between the two cities. To give an impetus to the work, another law was enacted instructing the Executive to proceed without delay with the construction of the line, provided experts approved of the proposition. The line is to be built under the direction of a commission, composed of the Minister for Public Works and four persons nominated by the municipal Councils of Quito, Ibarra, Tulcan, and Esmeraldas. The funds required are to be obtained from certain taxes designed as a guaranty for a foreign loan which has been authorised.

GERMANY.—In a report from Breslau, the American Consul in that city refers to the establishment of a new Electro-Chemical Co. (Electro-Chemische Fabrik Fürst von Pless) at Kattowitz. The purpose of this undertaking is the building of a chlorine factory in the neighbourhood of Emmanuelsgrün, near Boerschachte, and the production and sale of chloride of potassium, as well as of other electro-chemical products.

NORWAY.—A serious situation as regards the electricity supply of Stavanger was indicated in a recent report from the American Consul in that city. A lack of autumn rain threatened to produce such a shortage of electricity that the city might be without light and its factories without power. The lake supplying the water-power for the city's electric works had sunk more than 18 ft. below normal. Radical measures were being taken to conserve the remainder of the potential electric power. About 40 per cent. of this power (3,550 kW.) is used for light and heat, and about 60 per cent. (5,000 kW.) for the fish, textile, wood-working, &c., factories. The extreme northerly situation necessitates artificial light for a good part of the day. The electric works are in the mountains, about 18 miles from Stavanger, near Lake Otledal, which furnishes the water-power. A project has been under way for obtaining the main power from a river about 60 miles from the city, connecting the wires with Lake Otledal, so that both sources may be used. The unprecedented shortage was expected to hasten the work on this project, but two years at least will be required for its completion.

SPAIN.—The American Consul at Seville reports that permission has now been given for the extension of the telephone lines in that city to 22 towns in its vicinity. Some of the towns are petitioning for immediate connections, while some are waiting until proper financial arrangements can be made. It is expected that the first line will be installed between Seville and Guillena, as this is one of the neighbouring towns that has a considerably daily commerce with Seville.

Fire.—MESSRS. NALDER BROS. & THOMPSON, LTD., state that the fire which broke out at their works at Kingsland Green, on Sunday morning last, was fortunately discovered in time, and the damage done, though somewhat inconvenient, has not shut down the works. We are sure that their friends will excuse such slight delays as have been caused by this misfortune.

Board of Trade Inquiry.—The Board of Trade Commercial Intelligence Branch has been asked by firms at home for names of manufacturers of porous pots for electric batteries, No. 2 (5,000 required), and pumps for high vacuum, power-driven.

Trade with New Zealand.—Mr. W. G. Wickham, late H.M. Trade Commissioner for New Zealand, now H.M. Trade Commissioner for South Africa, has furnished the following particulars relative to imports of machinery into New Zealand in 1914:—Of the total value of the imports of machinery into New Zealand in 1914, about one-half paid duty under the preferential tariff. The electrical machinery and cables imported are almost entirely for lighting, telegraph, and telephone purposes. Of the imports of internal combustion engines, more than half are for motor cycles and motor boats. A further deduction for agricultural and dairy machines, and domestic and office appliances, leaves an exceedingly small residue available for industrial purposes. The following table shows the total value of imports of machinery into New Zealand in 1914 under the new classification, imports from the United Kingdom being especially distinguished:—

	From United Kingdom.	From all countries.
Under the preferential tariff.		
Steam engines and boilers ...	£18,037	£54,234
Internal combustion engines ...	132,467	156,701
Electrical machinery and accessories ...	117,954	236,163
Mining machinery ...	21,888	28,475
Sundry ...	113,925	160,691
Total ...	£463,771	£636,264

From the items quoted "Under the general tariff," we select two items:—Electrical cables and insulating materials, £123,916, United Kingdom; £156,005, other countries. Engineers' and machine tools, £34,545, United Kingdom; £57,844, other countries. In this section the totals are:—£268,189, United Kingdom; £598,015, other countries, making the grand totals, £731,960, United Kingdom; £1,234,279, other countries.

The statistical headings relating to electrical goods have in the year under review been amplified, and now yield information of some interest and value. In every line the United States was the chief competitor, with Germany following at a long distance. It is satisfactory to know that two-thirds of the generators, motors and transformers imported came from the United Kingdom, and more than half of the lamps and fittings. In the groups of machinery where competition is open, and no preferential duties apply, the United Kingdom made a poor show in 1914. Leaving out of account insulated electrical cables, only a bare one-third of the remainder was of British make. Telephones in the past provided an instance of goods being consistently supplied to the New Zealand market from foreign works when they might easily have been supplied from works in the United Kingdom. Of machine tools the United Kingdom supplied nearly two-thirds; the remainder was shared by the United States and Germany, the latter country being credited with 5 per cent. Of the considerable importation of insulated electrical cable and wire Germany supplied about 12 per cent. of the general trade. Importation in 1914 by the New Zealand Government included shipments of German origin valued at £7,500.

G.E.C. Electrical Plant for China.—Much has been written of late respecting the undoubted value of foreign markets to British engineering manufacturers. As an example of what is being done, we may refer to a few electrical contracts which have been secured in China recently by the GENERAL ELECTRIC CO., OF CHINA, LTD., whose head office is in Shanghai, with a branch office in Hong Kong. This company looks after the interests in Southern China of the General Electric Co., Ltd., of Wotton, &c. An important contract for the electrical lighting of the ancient city of Ningpo has recently been secured. A specially interesting point in connection with this contract is that the negotiations were very protracted, even by the Chinese standard, as they took nearly three years from start to finish. The existing plant is of German manufacture, and was partly secondhand when installed. The new plant will consist of a 120-kw. "Witton" steam-driven three-phase, high-pressure alternator, complete with main high-pressure switchboard, feeder panels, transformers, &c. The generating station is situated in the Chinese quarter of the city, and to transmit the electrical energy to the European quarter, under the new scheme a "submarine" cable is laid on the bed of the river. Previously, the Chinese had a very primitive high-pressure cable laid across a pontoon bridge, which was opened from time to time for sailing craft to get through. No proper system of breaking connection was provided—a rough-and-ready method of connection and disconnection only being used. Another recent contract is for the complete electrical plant for lighting the city of Yangchow. Electric light has not hitherto been used in Yangchow, but the first demand is for plant of 160-kw. capacity. As in the case of Ningpo a "Witton" high-pressure alternator direct coupled to a Bellicot and Morcom steam engine fed with steam from Babcock & Wilcox water-tube boilers, is used. In the south of China a contract was obtained recently for four complete lighting sets for the city of Kweilin. In addition to the above, plant and switchgear have recently been supplied to the Fatsun Electric Co., the Nanking Electric Co., Funshan City, &c. Several further contracts are now being negotiated. Besides the foregoing, the General Electric Co., of China, Ltd., has just supplied a 120-kw. three-phase "Witton" alternator, 10 10-H.P. one 25-H.P., and several smaller "Witton" motors for a Chinese cotton and rice mill at Yangchow. We understand further that the sales of Osram drawn-wire lamps, as well as electrical supplies generally, are exceedingly brisk in China and the company looks forward to a long period of great prosperity.

Annual Dinner.—The second annual staff dinner in connection with the EFANDEM CO., LTD., Fallings Park Works, Wolverhampton, took place on Friday night, Mr. Jesse Varley (director) presiding. Proposing the toast of "The Company," Mr. C. H. Stephenson said that during the year the works at Wolverhampton had been made the chief office of the company. Mr. Varley, in reply, said that in 1911 they started with a capital of £15,000; to-day they had approximately £100,000 employed in the business, and whereas their sales in 1911 were roughly £11,000, this year they had reached £15,000 per month, and like all new companies, they had had their difficulties and troubles, but owing to the loyalty and devotion of the staff they had overcome them all. This year they had done well. It would be within the knowledge of most of them that a new company—the Scott Electrical Co.—had been formed, and it was proposed to lay down works adjoining those of the EfanDEM Co. The Scott Co. had been registered with a capital of £100,000, and it was proposed to take over the electrical side of the EfanDEM Co.'s business, in order that the EfanDEM Co. might be enabled to increase their output in the portable electricity line. For the comfort of the staffs, it had been suggested that they should purchase a further plot of land in Park Lane for the erection of mess rooms and an institute for the benefit of the EfanDEM, Scott and British Ferro Plate Companies. This would mature in time. In the meantime they had to look to their business. It had been his privilege to attend a gathering of the leading manufacturers of portable electricity in the country. The EfanDEM Co. were the largest manufacturers of portable electricity in the world. At the present time they had little or no competition so far as outside companies were concerned, but they had to face it in the future, and they were endeavouring to influence the Board of Trade to grant them a protective tariff. Last week they had an interview with certain officials of the Board of Trade, and they were informed that if the EfanDEM Co. would prepare a scheme, it would be received favourably—sympathetically. They were preparing a scheme for submission to the Board with that object in view.

Mr. P. Smith proposed "Absent Colleagues with the Colours," and said there were 65 men from their workshops serving in the Army.

A pleasing entertainment, which was provided, included songs and monologues, concerted items by the EfanDEM Glee Party, and a display by T.E.C. Society of Artists.

Liquidations.—THE ADNL ELECTRIC CO.—The following are among the unsecured creditors in this case:—

Acme Electric Co. ...	£55	Horn, L. ...	£84
Alard & Co. ...	44	Hight Bros. ...	16
Anglo Engineering Co. ...	45	Hunt & Co., R. ...	13
Armstrong, W. ...	36	Leach, S. G. ...	18
Atlas Carbon and Battery Co. ...	12	Le Carbone ...	17
Bergmann Electricitäts ...	27,704	Michael Abrahams, Sons, & Co. ...	39
Werke, Berlin ...		Neuburger, J., München ...	19
Bush & Co., W. J. ...	127	Palmer & Co., A. ...	31
British and Northern S.S. Co. ...	13	Pechetayok, F., Berlin ...	26
Booth, H. C. ...	12	Rosenberg, R., Berlin ...	112
Century Electric Co., St. Louis, U.S.A. ...	416	Reid, Ferens & Co. ...	44
Crypto Electric Co. ...	163	Reliance Electric Wire Co. ...	36
Cresmond, H. E. ...	55	Swedish General Electric Co. ...	1,182
City of London Elec. Lig. Co. ...	25	Smith & Frie ...	21
Deutsche Telephone Werke, G.m.b.H., Berlin ...	1,965	Sterling Electric Co. ...	87
Eichenbach, —, Berlin ...	17	Straker & Co., E. ...	14
Endell Elec. Cable Mfg. Co. ...	13	U.S. Electric Tool Co., Cin. ...	88
Fueller Electrical Co. ...	49	Universal S. and F. Co. ...	19
Goslin & Sons, S. B. ...	60	White-Jacoby & Co. ...	24
		Walker Bros. ...	11

READER'S PATENTS AND ENGINEERING CO., LTD.—Creditors must send particulars of their debts, &c., to Mr. E. W. C. Whitaker, 3, Portland Street, Southampton, the liquidator, by April 12th.

HOLZAPFEL MARINE GAS POWER SYNDICATE, LTD.—A meeting is called for April 4th, at 57, Fenchurch Street, E.C., to hear an account of the winding up from the liquidator, Mr. N. W. Ward.

GOOD, MARRIOTT & CO., electrical and mechanical engineers, 4, Chesterfield Street, Nottingham.—Messrs. B. V. Marriott and F. E. Good have dissolved partnership. Mr. Marriott will continue the business under the same style, and will attend to debts, &c.

ECONOMISERS, LTD.—This company is winding up voluntarily with Mr. W. F. Johnson, 18, Theobald's Road, Bedford Row, London, as liquidator. A meeting of creditors is called for March 21st.

In the matter of J. DAVIS & CO. (SOUTHAMPTON), LTD., electrical engineers, Hands v. The Company, a receiver and manager was appointed by Mr. Justice Neville, in the Chancery Division last Friday. This was an application in a debenture-holder's action made because Mr. Thos. Davis, the sole director, had died suddenly.

Trade Announcements.—THE ELECTRICAL SUPPLIES CO., London, hold large stocks of wood blocks for electrical purposes.

With reference to a notice published in our last issue, MR. E. I. HILL has removed from 26, Stanton Road, to 2, The Broadway, Wimbledon. Telephone: No. 1239 Wimbledon.

MESSRS. G. NOAKES & CO., electrical engineers, of 32, London Street, Greenwich, S.E., announce that owing to enlistments they are relinquishing the business.

In addition to the vehicles illustrated in our last issue, we learn that ELECTROMOBILES (LEEDS), LTD., have acquired the sole British agency for the "Urban" electrical vehicles manufactured by the Kentucky Wagon Manufacturing Co., of Louisville, Kentucky, U.S.A.

Bankruptcy Proceedings.—W. D. BIRKETT, factor of electrical goods, Whitley Bay.—Receiving order made at Newcastle-on-Tyne, February 28th, on a creditor's petition. First meeting, March 16th; public examination, March 23rd—both at Newcastle-on-Tyne.

J. TAYLOR PREDIE, mechanical engineer, Aldwych Site, Strand.—March 18th is the last day for the receipt of proofs for dividend by Mr. F. S. Salaman, 1 and 2, Bucklersbury, London, E.C.

Book Notices.—*Questions and Solutions in Telegraphy and Telephony.* Final Examinations. By H. P. Few. London: S. Rentell & Co. Price 1s. 6d. net.—This book covers the questions set by the City and Guilds Institute in the final examinations of Telegraphy and Telephony for the period 1906-15, and gives very full solutions to the last papers. The syllabuses of the Institute in these subjects, and the answers to the numerical problems set in previous years, are appended. The answers given appear to be all that could be desired, and a great deal more than could be hoped for, by any examiner.

Journal of the Institution of Electrical Engineers. Vol. 54. No. 257. March 1st, 1916. The issue contains the Seventh Kelvin Lecture on "Lord Kelvin and Terrestrial Magnetism." By Dr. C. Chree, F.R.S.

"Employers and Workmen under the Munitions of War Acts." By T. A. Fyfe. London: W. Hodges & Co. Price 2s. 6d. net.

"Science Abstracts." A and B. Vol. 19. No. 218. February 28th, 1916. London: E. & F. N. Spon. Price 1s. 6d. each net.

The Electrical Press, Ltd., will shortly publish "The Motor Transport Year Book and Directory, 1916," at 10s. 6d. net.

The Engineer's Year-Book of Formulas, Rules, Tables, Data, &c., for 1916. Compiled and edited by H. R. Kempe, M.Inst.C.E. London: Crosby Lockwood & Son. Price 1 1/2s. net.—This valuable reference-book now makes its appearance for the twenty-third time, and is, if anything, more welcome than ever. It has grown appreciably in bulk; the text-matter now comprises 1,866 pages, the directory matter has been re-arranged, and French, Spanish, and Russian translations of the terms used in the directory have been appended. The revision of the Year-Book has been carried out as fully as usual, and amongst the new features are contributions on railway signals, aerial ropeways, electric drills, magnetic chucks, hydroelectric plant, mechanical draught, electrical plant &c. "Electrical Engineering" has been overhauled by Prof. G. A. Carus-Wilson, and "Steam Turbines" by Mr. H. L. Guy. If one were to contemplate the compilation, *ab initio*, of a reference-book which should cover practically all branches of engineering, and should be so useful as to be almost indispensable to every engineer, one would be appalled by the magnitude and complexity of the task. Let us be thankful, then, that the feat has already been accomplished, and that in "Kempe's Year-Book" we have an invaluable desk companion, an encyclopedia in miniature, and all in one handy volume.

Eight Months' Italian Trade.—The official figures of Italy's foreign trade for the first eight months of 1915 have just been published, and they show an aggregate total of 3,667,394,168 lire, and a shrinkage on the figures for the same period of 1914 of 168,111,814 lire. The shrinkage was chiefly on the imports, which on a total of 2,296,200,000 lire, showed a falling off of 194,700,000 lire; while the exports, to the value of 1,565,900,000 lire, marked an advance of 26,600,000 lire. The exports to, and imports from, various countries are shown in the following table:—

Exports, 1915. Difference on 1914.		
Austria-Hungary ...	104,926,000	— 32,139,000
France ...	270,055,000	+ 128,532,000
Germany ...	184,195,000	— 38,549,000
Great Britain ...	223,884,000	+ 28,704,000
Switzerland ...	178,513,000	+ 20,268,000
Argentina ...	70,206,000	— 14,618,000
United States ...	173,285,000	— 1,664,000
Imports, 1915. Difference on 1914.		
Austria-Hungary ...	33,636,000	— 145,072,000
France ...	90,407,000	— 83,382,000
Germany ...	149,602,000	— 186,051,000
Great Britain ...	285,205,000	— 83,382,000
Switzerland ...	41,671,000	— 8,894,000
Argentina ...	234,165,000	+ 207,041,000
United States ...	771,617,000	+ 459,961,000

These figures show that, while on the one hand there has been a falling off in the aggregate interchange of goods with Germany and Austria-Hungary, there has been an increase of Italian exports to France, Great Britain and Switzerland, and of imports from Argentina and the United States.—*L'Electrotecnica*.

Catalogues and Lists.—THE EDISON & SWAN UNITED ELECTRIC LIGHT CO., LTD., of Ponder's End, have issued a blue ground show-card of Royal Edison-wire lamps. An outstretched hand brings the lamp more closely under the attention than the card alone could do.

MESSRS. H. TINSLEY & CO., Eldon Park Works, South Norwood, S.E.—12-page illustrated pamphlet giving full particulars and prices of Dr. C. V. Drysdale's distortionless sine-wave phase-shifting transformers.

MESSRS. JENSON & NICHOLSON, LTD., Goswell Works, Stratford, London, E.—Circular giving particulars of their British Standard insulating compositions. Mr. Arthur Hutchings, who has joined the firm, will attend to all matters in relation to the electrical insulating varnish department.

Italy.—The Società Partenopea per Industrie Metallurgiche ed Elettriche has been formed at Naples with the object, while the war lasts, of manufacturing arms, munitions and war material, but later of working in iron, aluminium, &c., and selling the products of the same. The capital of the company is 1,000,000 lire in 10,000 shares of 100 lire each.

For Sale.—Darlington Corporation electricity department has for disposal two 100-kw. d.c. 460/520-volt dynamos direct coupled to enclosed steam engines; Messrs. Wheatley Kirk, Price & Co. will include in the sale by auction of the Barton Flour Mills, Gloucester, on March 29th, a 150-kw. electric light installation, complete with engine, boilers, superheaters, economisers, &c. Particulars are given in our advertisement pages to-day.

Board of Trade Inquiries.—H.M. Trade Commissioner in Canada reports that a firm in Toronto wishes to obtain agencies of United Kingdom manufacturers of electrical heating, pumping, and power house specialities. H.M. Consul at Rome reports that a local importer wishes to get into touch with United Kingdom manufacturers of small electrical appliances. Names and addresses can be obtained from the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

Football.—An interesting football match was contested on Saturday, March 4th, between the Ediswan Lamp Works, glass department, and Siemens Bros. Dynamo Works, Ltd., for the Siemens Silver Challenge Cup. The ground chosen was at the "Boundary," Ponder's End, kindly lent by Mr. Pass. After a very well contested game the honours went to the Ediswan team, who scored 3 goals to Siemens's 1. All the proceeds are to be utilised to provide comforts for the local lads fighting at the Front for their King and country.

LIGHTING AND POWER NOTES.

Accrington.—PLANT EXTENSION.—The Electricity Committee decided to obtain tenders and proceed with the work of installing a coal elevator and conveyor, which it is estimated will cost £700.

Barnstaple.—The T.C. has consented to the electrical engineer superintending the installation of the electric light at the Science and Art Schools.

Barrow.—PLANT EXTENSIONS.—The Electricity Committee reported that although the formal sanction of the L.G.B. had not been received to the borrowing of the moneys for the extensions, the Board had agreed to the order for the rotary converter being placed.

Birmingham.—PRICE OF ELECTRICITY.—The Electricity Committee states that the reduction of the rates for the supply of electricity in 1912 has been fully justified, as the growth of the output more than compensated for any loss in revenue, and the surplus each year had steadily increased; up to the end of the September quarter last year, it appeared that the revenue due to increased output would compensate for the advances in the cost of fuel and materials. Towards the end of November, however, the cost of materials, and especially fuel, rose rapidly, and as a result the returns for the nine months indicated that whilst the present year would show a surplus, unless an alteration were made in the charges the increased costs during the next financial year would not be met by the receipts. The Committee, therefore, recommends an increase of 15 per cent. on all charges for lighting and 20 per cent. on the charge for power, to take effect from the March reading of the meters. The H.T. supply is given under special agreements, which now contain a coal clause, advancing the price automatically. As opportunity arises, the agreements without the coal clause are being terminated, and new ones substituted. The Committee proposes to apply to the traction supply the terms of the coal clause in the H.T. agreements.

Blackburn.—TURBINE PUMPS.—The Waterworks Committee has requested an inquiry as to the early carrying out of the recommendation with respect to the erection of turbine pumps on the Bowland main.

Bo'ness.—The T.C. has received the report of the consulting engineer, Mr. J. M. Munro, of Edinburgh, on the conditions and prospects of the electricity undertaking, and the need for an immediate extension of plant. He approves of the scheme of the National Electric Construction Co. to install a new boiler of 10,000 lb. evaporative capacity, with mechanical stokers, superheater, &c. and a 500-kw. high-speed turbine unit with condensing plant, at a cost of £13,900, and on his recommendation the Council agreed to apply for sanction to the borrowing of £14,500. Mr. Munro pointed out that at present the inclusive capital outlay on the whole undertaking per kw. of running plant capacity is £73 10s.; after the extensions are completed the capital outlay per kw. of plant will be approximately £51. The number of kw. connected a year ago was 739, now they are 1,092. The maximum demand on February 9th, 1915, was 285 kw.; in the corresponding week of 1916, it was 400 kw.; on December 20th, 1915, the demand reached 465 kw. Recently a further 215 kw. of possible load was connected, and Mr. Munro adds that the load cannot obviously be carried with the present 500-kw. plant with no spares.

Dredbury and Romiley.—The U.D.C. has consented to the granting of an order to the Stockport Corporation to supply electricity in its area. The draft order provides that whenever the Dredbury and Romiley Council can satisfy the Board of Trade that it is in a position to supply electricity in its own district, the order can be revoked.

Brighton.—**REVISED CHARGES.**—The T.C. has given effect to a revision of charges for electricity as from the March 1915 meter readings, as follows:—First 1,000 units, 63d. per unit; per unit reduction for each extra 1,000 units to 3,000, and 4d. per unit for all above 3,000 units. Flat rate outside the city is to be 63d. per unit; by prepayment meters in the borough 1 unit and outside, 63d. per unit. Power 13d. per unit, first 10 units, beyond 14d. per unit.

Brimsley.—**PRICE INCREASE.**—The Electricity Company has increased the charges for electricity for ordinary lighting from 34d. to 35d. per unit; for heating and domestic purposes from 14d. to 15d.; and for traction from 1'20d. to 1'25d. The old rates for power remain, except that the charge will be plus 10 per cent. and 5 per cent.

Chichester.—**PLANT.**—With reference to the inauguration of new three-phase H.T. plant, which has been installed by the Corporation electricity department, this had become necessary on account of the growth of the demand in one section of the town. A sub-station was erected at Holmby Street, and two 1,000-kw. rotary converters with transformers, switchgear, &c., installed. This plant is fed at 6,600 volts, three-phase, from a 1,000-kw. Westinghouse turbine set at the generating station. The turbine is at 3,000 R.P.M. on steam at 160 lb. pressure, and is equipped with a surface condenser and turbine-driven pumps. Two 600-kw. rotary converters are installed to link up the A.C. and D.C. plant.

Burton-on-Trent.—**LOAN REFUSED.**—The L.G.B. has refused sanction to the borrowing of £3,500 for works in connection with the electricity undertaking. The Board further stated that it was of the opinion that the cost of additional transformers and switchgear would be met out of revenue.

Colchester.—The Electricity Supply Committee reports that the total output of electricity for the month of January was 1,000 units, as compared with 186,084 for January, 1915. The number of consumers was 2,773, as compared with 2,686.

Continental.—**ITALY.**—At a meeting of the Consiglio Municipale of Rome, in October last year, a loan to the amount of £1,000,000 lire was sanctioned for public electric lighting improvements. Of this sum, 1,137,580 lire has already been spent in new installations and in the conversion of the previously existing oil and gas lighting to electricity, and a further 237,565 lire has been disbursed in the erection of two 1,500-C.P. lamps; 101 600-C.P. half-watt lamps; and 750 200-watt, 100-watt and 60-watt glow lamps in some of the principal streets of the city and suburbs. It is the intention of the electric light department to proceed with the further extension of the public electric lighting service, and a further sum of 410,000 lire is to be spent on the installation of 53 600-C.P. lamps and 2,047 glow lamps.

Dartford.—**PRICE INCREASE.**—The U.D.C. has decided to hold a special meeting to consider the Electricity Committee's report and recommendations. A deficit of £3,000 is estimated on the year's working of the undertaking, and the Committee, in view of the increase in cost of coal, recommends that the charges for lighting and power be increased by 20 per cent. from April 1st. The U.D.C. is to be asked to sanction the borrowing of £1,076 to meet expenditure over the amount sanctioned for the extension of the electric light station and plant, and to cancel the unexpended £1,076 in connection with the overhead cable.—*Dartford*

Derby.—The Electricity Committee reports that with the contracts for coal now being concluded, it is hoped to ensure a supply for the ensuing 12 months. While the lighting requirements have fallen off, the demand for power has increased during the 12 months ended December 31st with a profit increase of 10 per cent. in the 10 per cent. advance charges realised £2,600 during the nine months.

Felixstowe.—**MR. R. P. WILSON,** the Council's electrical engineer, reports that it is necessary to install a booster, &c., to meet the pressure in part of the district. The Council has submitted to obtaining the consent of the L.G.B. to a loan, to enable the money, estimated at £140, for the work.

Guatemala.—According to the *Journal of Electricity*, the result of the war is that Ocos will lose its electric light. Nine years ago, the Kosmos liner *Sesotris* was beached on the coast, and the chief engineer, left in charge, supplied the town electricity from the ship's installation. Now the price of shipping has reached a point where it appears to be profitable to dig a canal and float the ship back to sea.

Hastings.—Owing to the restricted lighting, the Corporation Electric Lighting Committee estimates a deficiency of 80f

India.—**ELECTRIC HEATING.**—The Simla municipality is encouraging the use of electric heaters by offering special rates, bringing the cost down to, approximately, that of coal fires, and electric heating by electricity has become very popular in the winter. The high cost and difficulty experienced in obtaining satisfactory radiators, &c., from England led to the local electrical engineer experimenting in this direction, with

the result that radiators, water-boilers and several other types of heating apparatus have been constructed to suit individual requirements. The local made heaters are favoured to such an extent that the municipality cannot nearly keep the supply up to the demand. Several types have been standardised, and they are produced at a cost of half to one-third that of imported heaters. The elements used are manufactured in the country and the design has been patented by the inventor. The public has the option of either purchasing the heaters or of hiring them. A special tariff, which includes both the hire of the heater and current, has also been introduced. These appliances are stated to be the invention of Mr. F. L. Milne, of the Simla electricity department.—*Indian Engineering.*

With reference to our note on page 202 on the subject of Calcutta charges, which was based on the statement of an Indian contemporary, we understand that the statement that the Calcutta Electric Supply Corporation charges 81. and 4d. respectively per unit for lighting and power is incorrect, as the company allows a discount of 25 per cent. off these prices to all consumers. Consequently, it would be more correct to state that the prices charged are 6d. and 3d. respectively per unit for lighting and power. Further, the company allows a gradual scale of additional rebates to large consumers, reducing the prices down, in some cases, as low as 34d. per unit and 2d. per unit for lighting and power respectively. The supply to the Government is at the rates charged to ordinary consumers. The only advantage to the Government is that it is allowed to aggregate its consumption at the different Government establishments for the purpose of getting the maximum rebates. Large consumers for power purposes at factories are supplied with alternating current at a pressure of 6,600 volts, at very low prices.

Japan.—According to a report from Tokio, occasional interruptions in the operation of the high-tension transmission lines in Japan have been found to be due to the fact that reptiles climb the masts and enjoy a sun bath on the cross arms, and, in the course of their walks abroad, create short circuits.

Kendal.—The estimated net deficit on the electricity undertaking, for the 12 months ending March 31st next, amounts to £370.

Leeds.—The local Chamber of Trades is leading a vigorous protest against the suggested increase of prices for electricity supply by the Corporation. One ground of protest is that large advances of salary have recently been granted to officials.

London.—**MR. H. W. BOWDEN,** referring to the use of coke breeze under the boilers at the South Metropolitan Electric Light and Power Co.'s station, mentioned at the company's meeting recently that the results obtained over a period of nearly 12 months showed a considerable saving, notwithstanding excessive repairs due to design and stressed conditions. Although, owing to the demands on the plant, the experiment had been abandoned, he saw no reason to prevent the exclusive burning of coke breeze (unassisted by coal) in a boiler house properly designed and ventilated. This was important when using forced draught with a sulphurous fuel. He further mentioned that the new H.T. transmission lines and 3,000-kw. sub-station at Crayford, about 10 miles from the power house, had been brought into use. During the year about 1½ million units were sent over the feeders; the maximum load was 6,250 kw., and the coal cost was 37d. per unit. New turbo-generator and boiler plant was expected to be in commission during the month.

BATTERSEA.—The Electricity Committee recommends that owing to the restricted lighting an allowance of £1,000 be made in the next financial year from the total amount which would have been charged for public street lighting at the current rates.

L.C.C.—The Finance Committee recommends the County Council to sanction the borrowing of £3,000 by the Hackney B.C. for mains and switchgear, and of £2,000 by the Poplar B.C. for its share in linking-up costs.

MARYLEBONE.—The revenue statement of the B.C.'s electricity undertaking, for the December quarter, shows a total income of £69,991, an increase of £5,832 over December, 1914. The expenditure amounted to £21,636, an increase of £2,197, i.e., 1'042d. per unit as against 1'012d. in 1914. The net result is a balance of £44,168 available for capital charges, an increase of nearly 11 per cent., as compared with December, 1914. The output sold for the respective December quarters of 1915 and 1914 was 4,982,454 and 4,614,801 units. The Electricity Committee has refused a request for increased wages by members of the Amalgamated Union of Enginemen, &c.

The Metropolitan Electric Supply Co., Ltd., is increasing the charges for electricity for lighting, heating and cooking by a further 10 per cent., from the end of the present quarter.

HACKNEY.—The engineer recommends the installation of an auxiliary battery for excitation purposes at the generating station, at an estimated cost of £465. Hitherto the alternators have been excited from the main battery, but recently owing to a short circuit on the D.C. bus-bars and the consequent drop of pressure on the battery terminals, the excitation of an alternator was reduced so that the converters were able to send a reverse rush of power into the alternator and operate the reverse current relays, leading to a temporary shut down.

ST. PANCRAS.—The Electricity Committee has reported on two or three fires which occurred in a reserve coal store in December and January. The chief engineer held that the pouring of water on the coal by the fire brigade had caused spontaneous combustion, although the fire brigade authorities did not agree to this view. It is estimated that the loss to the undertaking in cartage, labour, and calorific value is about £1,300.

Manchester.—The Electricity Committee, owing to the great demands on its plant, has been compelled to refuse a supply to a proposed new works, whose requirements would have been "equal to the whole of the lighting in Manchester" (says the *Manchester Evening News*). Ald. Walker, in referring to the loss of these works to the city, pointed out the absurdity of the opposition of the Ratepayers' Association and others to the proposals of the Electricity Committee, through which he does not doubt that the city has suffered considerably.

Nuneaton.—INSURANCE, &c.—The T.C. has decided to obtain quotations for insuring the electricity works against damage by aircraft, for a total indemnity of £12,000. In respect of restricted lighting for nine months ending December, 1915, the Electricity Committee has allowed a rebate of £150.

Ripon.—E.L. PROPOSALS.—The City Council has adopted the Electricity Committee's recommendation that inquiries be made of the Harrogate Corporation as to what price it would supply electricity in bulk, at the city boundary, and also on what terms the Thirsk authorities would give a supply.

Shaldon.—E.L. SCHEME.—At a meeting on March 2nd an E.L. scheme for the district, to be carried out on co-operative lines, was submitted by Dr. Purves, of Exeter, and a motion in favour of the project was adopted. The company interested proposes to supply current at 3d. per week per 25-c.p. lamp, or 2½d. per unit, if consumers do their own wiring.

Sheffield.—LOAN SANCTIONS.—The formal sanctions of the L.G.B. have been received to the borrowing of the following amounts for additional plant at Neepsend:—£3,100 for reservoir pipe work and circulating water discharge pipes, valves, and bends; £1,250 for cables for connections and auxiliary boards; £49,742 for new plant and foundations, switchgear, and accessories; £45,050 for three new boilers, sludge pump and pipe work, screens, motor pump and housing, boiler foundations, sub-station equipment and transformers; £12,500 for cooling towers and foundations, coal shoots.

Southampton.—ASH PLANT.—The T.C. has adopted a scheme of the electrical engineer for removing the a-see. clinker, &c., at the works, by other means than the existing coal conveyor. The total cost of the work is put at £500, which will be defrayed out of revenue. This includes £300 for a lift, for which it is proposed to obtain tenders; the remainder of the work will be carried out by direct labour.

Southwold.—PRICE INCREASE.—It is announced that the Electricity Co. has increased the price of current (7d. per unit), by 20 per cent.

Wigan.—Mr. S. L. Pearce, the city electrical engineer of Manchester, has been appointed to report exhaustively upon the Corporation's electricity undertaking.

TRAMWAY and RAILWAY NOTES.

Aberdeen.—The Corporation Tramways Committee has instructed the manager to try for six months a new type of ventilated motor for the cars.

Australia.—The Melbourne, Brunswick and Coburg Tramways Trust is entering into negotiations with the recently-formed Fitzroy, Northcote and Preston Tramways Trust for the construction and the running of the latter system. It is understood that there is a good opening for the economical running of the two systems under one management.—*Melbourne Age*.

SYDNEY CITY RAILWAY.—The N.S.W. Minister of Works forecasts the successful working of the City Railway from the commencement of operation, which is assumed to be in 1920. The first year's working is estimated to give a net surplus of £125,000, and for 1925, the net surplus is estimated at £369,000. The total cost of the work, which is to be commenced this month, is estimated at £7,000,000. Two types of car are under consideration, with accommodation for 100 passengers seated and 166 standing, and 98 seated and 100 standing respectively.—*Sydney Telegraph*.

Blackpool.—Commencing on April 1st, soldiers are to be allowed to use the Corporation tramcars on payment of half-fares, this applying to all routes except the circular routes.

Bristol.—TRAMWAYS PURCHASE.—At the annual meeting of the Bristol Tramways and Carriage Co., on March 2nd, Sir George White referred at some length to the negotiations which have taken place with the Corporation in connection with the proposal of the latter to acquire the tramway undertaking. In this connection, the correspondence between the Corporation and company, from October, 1914, to January, 1916, was published in the *Western Daily Press* of March 3rd, which, in an editorial, points out that the economic situation has completely changed during the war, and that the new situation has been used by the directors in the interests of the shareholders. Two years ago the situation favoured the exercise by the Corporation of its option; it could have raised money at 3½ per cent.; it could not now raise any money in the open market, and the Tramway Co.'s offer to find

the money at ½ per cent. above current Government rate, would mean that the city would have to pay 5½ per cent., which, with the provision for sinking fund, gives the proposal quite a new complexion. Our contemporary sums up the matter by indicating what appear to be three courses open:—(a) The acceptance of the offer of the Tramways Co. to sell to the city the tramways system and the motor-omnibuses on the financial terms which the present situation would require; (b) the acceptance of certain concessions (not as valuable as the Option Committee hoped to secure) on the condition of waiving the option of purchase for 14 or 21 years; and (c) to let the whole matter stand over until 1922. It further hints that the choice, under the circumstances, may lie between (b) and (c).

Continental.—ITALY.—La Società Tramvie Campidano-Poetto is the name of a new company which has been formed in Cagliari, with a capital of £52,000, to acquire and electrify the Campidano and Poetto steam tramways.

SPAIN.—A concession has been granted to the Sociedad Tranvia del Ete de Madrid for the construction and working of an electric tramway in Madrid (Monte del Pardo district).—*Board of Trade Journal*.

SWITZERLAND.—The *Electric Railway Journal*, quoting a Continental source of information, states that bow collectors are to be substituted for trolley collectors on all the Zurich tramway cars. A great reduction in delay, due to trolley wheels jumping off the wire, and repairs, has been found on a route experimentally equipped with bow collectors.

Darwen.—SCHOOL RETURN TICKETS.—The Tramways Committee has decided to issue return tickets for school children for one penny, available for the journeys to and from school.

Edinburgh.—Several important notices of motion referring to tramway affairs have been tabled by the T.C., including a proposal to consider the expediency of appointing a tramway manager and establishing a tramway department, the advisability of appointing a tramway engineer to attend to the interests of the Corporation during the remainder of the lease, and a proposal to consider "as to the advisability, in the public interest, of adopting legal proceedings to terminate the lease between the Corporation and the company, in respect of its failure to implement its undertaking to provide an adequate service of cars in the city."

Lancaster.—The T.C. has decided to purchase and run three motor-buses, for the accommodation of the workers at the new works now being erected in the town.

London.—At a recent inquest on the driver of an electric train, whose body was found in the tunnel at the Crystal Palace, it was mentioned that a wedge was found in the compartment of the train which he had in some way got out of, which might have served to render the so-called "deadman's handle" inoperative. The attention of the guard was drawn to the fact that something was wrong, by the train running at high speed through a stopping station, and he subsequently applied the brakes and stopped the train.

Northampton.—A statement as to the working of the tramways undertaking for the year to March 31st next shows an estimated balance of £4,594, which it is proposed to appropriate as follows:—To reserve fund, £2,600; to relief of rates, £1,500; balance to be carried forward (or the actual amount), £494. Application is to be made to the B. of T. to extend the period for exercise of the powers relating to trolley vehicles and tramway extensions not already carried out, as contained in the Corporation Act of 1911, for a further period of 12 months.

U.S.A.—The *Electric Railway Journal* states that the Interborough Rapid Transit Co., of New York, has ordered from the Westinghouse Co. a 70,000-kw. turbo unit for its Seventy-Fourth Street power station. The unit will be in three sections, one high-pressure and two low-pressure, and on light load it will be capable of operation at high economy with the high pressure and one low-pressure cylinder. The three electric generators of the unit will be of equal s.z., and at about 60,000 kw. will divide the load equally. The steam pressure to be used will be about 225 lb., and the superheat approximately 156° F.

The *Journal of Electricity* states that the electric towing "mules" at the Panama Canal have been modified, to allow of the two main induction motors being operated in cascade at half the speed for which the machines were designed; the speed of the "mules" is thus reduced from two to one mile an hour.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—SYDNEY.—May 1st. Two 300-kw. turbo-alternators, condensers, switchboard, &c., for the pumping station at Ryde, for the Metropolitan Board of Water Supply and Sewerage at Sydney.*

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-kw. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.), from the Engineer's office, 61, Hunter Street, Sydney.*

MELBOURNE.—April 26th. Electrical equipment and accessories for sub-station for the Sandingham-Black Rock tramway.*

Aberdare.—March 11th. U.D.C. Electrical stores for 12 months. See "Official Notices" February 18th.

Belfast.—March 15th. Tramways and Electricity Committee. Stores, including a number of electrical items. See "Official Notices" February 25th.

Dundalk.—March 21st. U.D.C. Engine-room stores, cables, lamps, &c., for the Electricity Department. See "Official Notices" February 25th.

Dundee.—March 29th. Corporation. Electrical stores, meters, &c. Electricity Department, Dudhope Crescent Road.

Heston and Isleworth.—March 11th. U.D.C. Electrical supplies, including cables, meters, &c. See "Official Notices" February 25th.

Heywood.—March 15th. Electricity Committee. Stores, including some electrical items, for 12 months. See "Official Notices" February 25th.

London.—WESTMINSTER.—B. of G. Six months' supply of electric lamps, fittings, &c. Mr. W. J. Lickley, Clerk, (Guardians' offices, Princes Row, Buckingham Palace Road, S.W.)

Manchester.—March 22nd. Electricity Committee. 6,600-volt three-phase switchgear, for Stuart Street station. See "Official Notices" to-day.

Merthyr Tydfil.—March 18th. Electrical accessories for six months for the B. of G. Mr. F. T. James, Clerk, 134, High Street.

New Zealand.—DUNEDIN.—May 17th. City Council. (1) Tramcar bodies; (2) electrical equipment. Plans, &c., from the Town Clerk, Dunedin.

Wanganui.—May 9th. Borough Council. Gas producer plant, gas engine, generator and switchgear.

Pontypridd.—March 13th. U.D.C. Twelve months' supply of electrical stores for the Electric Light and Tramways Department. See "Official Notices" February 18th.

South Africa.—March 20th. S.A. Railways and Harbour Administration. 5,106 train-lighting cells.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London

CLOSED.

Barrow.—Corporation. Rotary converter and switchgear, British Thomson-Houston Co., Ltd., £2,760. The contract for 80 tons of coal per week—Pope & Pearson's washed smalls—at 19s. per ton delivered, has been extended for six months.

Croydon.—Corporation tramways. Wotan, tantalum, and carbon filament lamps for the year. Siemens Bros. Dynamo Works, Ltd.

Horsham.—U.D.C. Tender of the Electrical Apparatus Co., Ltd., for D.C. house-service meters for 12 months, accepted.

Leyton.—The Tramways Manager has purchased 10 tons 13 cwt. of steel tramway rails for £128. Messrs. B.I. & Helsby Cables, Ltd., have received a contract for trolley wire.

London.—BATTERSEA.—The Electricity Committee recommends acceptance of the following tenders:—

Oils, with the exception of turbine oils.—Price's Co., Ltd. Packings.—Beldam & Co. Consumers' fuse boxes.—British Insulated & Helsby Cables, Ltd. Electrolytic meters.—Reason Manufacturing Co., Ltd.; Bastian Meter Co., Ltd. Mercury meters.—Chamberlain & Hookham, Ltd.; Ferranti, Ltd. Box compound.—Dussek Bitumen Co. Troughing, conduits, beltings, &c., and way-bridges.—Callender's Cable and Construction Co., Ltd. Coal.—Shipley Bright small nuts, Myers, Rose & Co., Ltd.; Pooley Hall small nuts, Foster & Co.

The Committee also recommends that no contracts be entered into at present for house-service boxes, &c., and watt-hour electricity meters.

BERMONDSEY.—The Electricity Committee recommends the renewal of the following contracts for annual supplies:—

Carbon brushes.—Morgan Crucible Co. Cable.—C. Macintosh & Co., with the addition of 24 per cent. Insulating box compound.—Dussek Bitumen Co., subject to an increase of 8s. per cwt. Conduits.—T. Wragg & Sons, with certain exceptions. Joint boxes.—Stokes & Sinden, plus 10 per cent. Quotations for rubber and certain other cable and cut-outs will be obtained as required.

The Committee has purchased 30 tons of Welsh and picked steam coal out of contract from C. Penlan, at 37s. per ton for the Welsh and 38s. 6d. per ton for the steam coal, and has accepted the quotation of Babcock & Wilcox, Ltd., for the four tubes, fire bars, &c.

L.C.C.—The Highways Committee has received the under-mentioned tenders for the supply of 500 driving-wheel tires and 250 pony-wheel tires:—

	Driving-wheel tires.	Pony-wheel tires.
H. Bessemer & Co., Ltd.	£38 10s. a ton, less	£25 10s. a ton, less
(accept 4)	24 per cent. dis.	24 per cent. dis.
Cammell, Laird & Co., Ltd.	£38 10s. a ton.	£25 10s. a ton.

The cost of the tires is estimated at £2,300.

HACKNEY.—The Electricity Committee has received the following tenders for an auxiliary battery, &c.:—

	BATTERY.	Price.	10 years' maintenance at per annum.
Hart Accumulator Co., Ltd.	(accepted)	£251	£17 16 0
Tubor Accumulator Co., Ltd.		254	18 10 0
Chloride Electrical Storage Co., Ltd.		257	18 10 0
D.P. Battery Co.		250	18 8 0
	CHARGING BOOSTER.		
Electromotors, Ltd.	(accepted)		54 0 0
Crypto Electrical Co., Ltd.			55 0 0
Siemens Bros. Dynamo Works, Ltd.			58 0 0
J. H. Holmes & Co.			62 0 0
	SPECIAL SWITCHGEAR.		
Nalder Bros. & Thompson, Ltd.	(accepted)		93 0 0

ST. MARYLEBONE.—The Electricity Supply Committee recommends the acceptance of the following tenders:—

New economiser. £1,242. E. Green & Son, Ltd. Repairs to artesian well pump. A. C. Potter & Co. Re-linking chain grate stoker. £115.—Babcock & Wilcox, Ltd. Coal.—Charrington, Sells, Dale & Co., 1,600 tons of Langwith and Glapwell nutty slack, at 2s. 6d. per ton, during the four months March to June inclusive. A. Blackmore & Co., 11,000 tons of Low Lathes Yorkshire washed nuts, at 28s. 9d. per ton, at the rate of 1,000 tons per month from August, 1916.

The Committee does not think it desirable to enter into contracts for general supplies for 12 months to March, 1917, and has limited the inquiries to supplies which will be required for six months only. As regards small house cable, flexible cords, rubber goods and insulating material, the Committee considers that it would be advantageous to buy in the open market as and when required.

Underground cables.—B.I. and Helsby Cables, Ltd. The Committee has taken advantage of the high prices ruling in the metal market to dispose of a quantity of scrap cable and also of some surplus stocks at profitable rates. Prices cleared: copper £106 per ton, lead £82 per ton, and sundry small cable (unstripped) £36 per ton.

METROPOLITAN WATER BOARD.—St. Helens Cable and Rubber Co., Ltd., V.I.R. cable and flex, £40; Simplex Condrite, Ltd., electric light fittings, £28.

WANDSWORTH.—The Guardians will not this year invite tenders for the supply of electrical fittings, &c., for set periods, but quotations will be obtained as required.

Southampton.—The Tramways Committee. Messrs. Edgar Allen & Co., points and crossings, £196.

Sunderland.—Electricity and Lighting Committees. Accepted tenders:—

Metallic packing.—Penman Metallic Packing & Engineering Co. E.T. switchgear.—Ferranti, Ltd. Governor valves.—Willans & Robinson, Ltd. Creosoted wood troughing, &c.—Armstrong, Addison & Co.

Winchester.—Corporation electricity works. Alexander Duckham & Co., Ltd., engine and cylinder oils for a year.

FORTHCOMING EVENTS.

Physical Society of London.—Friday, March 10th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. Experiments illustrating "The Flow of Heat in Conducting Sheets," by Mr. S. Skinner; "The Absorption of Gas by a Quartz Vacuum Tube," by Messrs. R. S. Willows and H. T. Gordon.

Manchester Association of Engineers.—Saturday, March 11th. At the Grand Hotel, Aytoun Street. Paper on "India-rubber and Balata Belting as Conveyor and Power-transmission Belts," by Mr. J. Tinto.

Royal Institution of Great Britain.—Saturday, March 11th and 18th. At 3 p.m. At Albemarle Street. Lectures (I and II) on "Radiations from Atoms and Electrons," by Prof. Sir J. J. Thomson. Thursday, March 16th. At 8 p.m. Lecture on "Organic Chemistry in War: Organic Products used as Propulsive and Explosive Agents," by Prof. H. E. Armstrong, F.R.S.

Belfast Association of Engineers.—Wednesday, March 15th. Paper on "Civil and Military Engineering under the Roman Empire," by Mr. A. McIl. Cleland.

Faraday Society.—Wednesday, March 15th. At 8 p.m. At the Institution of Electrical Engineers, Victoria Embankment, W.C. Informal discussion on "Methods and Appliances for the Attainment of High Temperatures in the Laboratory," opened by Dr. J. A. Harker, F.R.S.

Nottingham Society of Engineers.—Wednesday, March 15th. At 7.30 p.m. At the Welbeck Hotel, Milton Street. Paper on "Brass Foundry Practice," by Mr. H. L. Reason.

Institution of Electrical Engineers.—Thursday, March 16th. At 8 p.m. At Victoria Embankment, W.C. Paper on "The use of Continuous Current for Terminal and Trunk Line Electrification," by Mr. N. W. Storer.

Students' Section.—Wednesday, March 15th. At 7.45 p.m. At the I.E.E., Victoria Embankment. Adjourned discussion on "Suggested Applications of Science in Warfare."

(Birmingham Local Section.)—Wednesday, March 15th. At 7 p.m. At the University, Edmundo Street. Mr. J. S. Peck will read Mr. N. W. Storer's paper on "The use of Continuous Current for Terminal and Trunk Line Electrification."

(Scottish Local Section.)—Tuesday, March 14th. At 8 p.m. At 27 Bath Street, Glasgow. Kelvin Lecture on "Terrestrial Magnetism," by Dr. C. Chree.

Chemical Society.—Thursday, March 16th. At 8 p.m. At Burlington House, Piccadilly, W. Ordinary scientific meeting.

Institution of Mechanical Engineers.—Friday, March 17th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. Paper on "The Composition of the Exhaust from Liquid Fuel Engines," by Second-Lieut. R. W. Fenning, R.E.(T).

Greenock Electrical Society.—Friday, March 17th. At 7.45 p.m. At the Temperance Institute, 18, West Stewart Street. Papers on "Some old Diagrams of Connections," by Mr. D. Angus, and "Heating and Ventilation," by Mr. W. A. Toppin.

Electro-Harmonic Society.—Friday, March 17th. At 8 p.m. At Holborn Restaurant. Smoking concert.

NOTES.

L.C.C. Committees.—The L.C.C. is recommended to confirm the appointment of the members of the following Committees for 1915-16:—

Highways Committee.—Sir John Benn, D. Davies, G. M. Gillett, A. O. Goodrich, W. Haydon, D. Hazel, T. F. Hobson, G. H. Hume, W. Hunt, H. Marks, Capt. T. Prestige, A. H. Scott, P. C. Simmons, W. J. Squires, H. Ward and A. W. Yeo.

Stores and Contracts Committee.—W. H. Ecroyd, W. Haydon, W. C. Johnson, Miss A. S. Lawrence, O. Lewis, H. Marks, H. Parsons, I. Salmon; the Education, Fire Brigade, Highways, Drainage, and Parks Committees have each to elect a representative.

Foreign Trade.—THE FEBRUARY FIGURES.—The following are the electrical and machinery figures given in the official returns for February:—

IMPORTS.

Electrical goods and apparatus, excluding machinery and unsulated wire	Month of February.	Inc. or dec.
... ..	£96,494	+ £27,416
Machinery	613,691	+ 10,168

EXPORTS.

Electrical goods and apparatus, excluding machinery and unsulated wire	298,638	+ 124,768
Machinery	1,524,653	+ 238,785

The Electric Vehicle Committee.—At a meeting of the Electric Vehicle Committee on February 18th, the increasing circulation of the official publication was commented on. The Committee had before it a letter from the secretary of the Electric Vehicle Association of America, offering every assistance in helping forward the movement.

The Committee has accepted an invitation by the Society of Motor Manufacturers and Traders to nominate a representative to sit upon the Tire Research Committee, which has recently been appointed to investigate all technical matters concerning rubber tires.

The Committee considered a communication from the Accumulator Manufacturers' Section of the B.E.A.M.A., stating that it was prepared to agree to the standard sizes and ratings as set forth below. These will be known as E.V.C. standards, but it is hoped that, in due course, the British Engineering Standards Committee may give them the mark of approval by adopting them as British standards.

"E.V.C." Standard Rating.—This shall be the capacity in ampere-hours obtained by a continuous discharge at a uniform rate for a period of five hours until the voltage of the cell falls to 7. Example: If a battery is specified to have an "E.V.C." standard rating of 180 ampere-hours, it means that the battery will give this capacity when discharged at a continuous rate of 6 amperes for a period of five hours, at the end of which time the voltage per cell shall have fallen below 1.7 volts.

"E.V.C." Standard Plates.—Height, $8\frac{1}{2}$ in.; width, $5\frac{1}{2}$ in.; lug centres, $4\frac{1}{2}$ in.

"E.V.C." Standard Overall Sizes.—For all sizes the width of the cell shall be $6\frac{1}{2}$ in. and the overall height, including connector, $4\frac{1}{2}$ in. The length of the smallest size, i.e., that with seven plates, shall be $2\frac{1}{2}$ in., with the addition of $\frac{1}{8}$ in. for each pair of plates above seven plates.

An exception is made in the case of the Chloride Accumulator Co.'s "Ironclad-Exide" type of cell, in connection with which the length of the seven-plate size is $2\frac{1}{2}$ in., with the addition of $\frac{1}{8}$ in. for each pair of plates above seven plates.

"E.V.C." Standard Inspection Plug.—Shall be that which will fit a hole in the cover of the cell $1\frac{1}{2}$ in. in diameter.

"E.V.C." Standard Charging Voltage.—Shall be that which is suitable for charging 44 lead-acid cells, i.e., 85 to 120 volts.

The Committee has had brought to its notice difficulties which are being experienced in a few of the districts bordering upon the London area by electric delivery vehicles, operating from London along delivery routes, in getting boosting charges. The difficulties consist in either delay in getting connected up for charging owing to there being no permanent connection for the purpose, or, on the other hand, the exorbitant price charged for the service. The Committee appeals to all central station engineers to note, where they have not already done so, the Committee's standard tariff of 1d. per unit for "off peak" charging, with a minimum of 2s. per charge (24 units at 1d.), to include all connecting-up and disconnecting. At first, all that is necessary is a permanent (for the time being) connection from the switchboard to bars through a D.P. switch and fuses, or a maximum overload circuit-breaker, through an adjustable wire resistance to a British standard charging-plug. If, perchance, there is a booster set, or exciter in the station, giving about 120 volts, that can be used for this purpose when required, so much the better. The proper permanent charging plant can be put in when the first car is fitted to permanent use in the district.

Glass Telegraph Poles.—According to the *Journal of the Telegraphic Engineers*, reinforced glass telegraph poles are being made in many for use in the Tropics and elsewhere, as being immune from the attacks of white ants, &c., and proof against climatic influences, and more lasting than wood. The poles are cast in moulds, in which is a fine network of steel, the combination giving a product of great strength.

Red Cross Concert.—In the streets of London the afternoon of Saturday last was cold and raw, but in the King's Hall of Holborn Restaurant was warmth and light and friendliness, for the Junior Institution of Engineers were gathered for a Bohemian concert "in aid of the funds of the Red Cross Hospital of the City of London Branch of the British Red Cross Society." Sir Boverton Redwood, Bart. (Past President), was in the chair, supported by the Lord Mayor. The artistes were as follows:—Soprano, Miss Ethel Williams; contralto, Miss Mary Williams; baritone, Mr. Archie Anderson; elocutionist, Miss Frances Edmunds; royal campanologist, Mr. Wilfrid Alderton; cornet soloist, Mr. Chas. Leggett; living marionettes, Mr. Arthur J. Hill; character sketches, Mr. Ernest Cherry; humorous songs, Mr. Walter Montagu. Accompanists, Mr. R. Cooper and Mr. Fred. Froud. Hon. musical director, Mr. Geo. T. Bullock. The thanks of the Institution were proffered to Sir Boverton Redwood by Mr. Tooke. The Lord Mayor arrived early, and made, just before the interval, a brief speech. He introduced Mr. Richard Davies, Chairman of the City of London Branch of the Red Cross Society, who had a silent and very attentive and sympathetic audience to listen to his interesting account of the hospital, and his tactful appeal for aid. Although not in the programme, mention must not be omitted of a bevy of nurses in blue and white with the Red Cross badge, who dispensed programmes in return for donations to the hospital funds. The audience numbered 646.

Institution and Lecture Notes.—The Faraday Society.—The Society will hold an informal discussion on "Methods and Appliances for the Attainment of High Temperatures in the Laboratory," on Wednesday, March 15th, at 8 p.m., at the Institution of Electrical Engineers, Victoria Embankment, W.C. Dr. J. A. Harker, F.R.S., of the National Physical Laboratory, will open the discussion, over which Sir Robert Hadfield, F.R.S., the President of the Society, will preside. Workers interested in the subject, and particularly those prepared to speak on the results of their personal experiences, are invited to be present and take part in the discussion. Further particulars may be obtained from Mr. F. S. Spiers, secretary to the Society, 82, Victoria Street, London, S.W.

Institute of Metals.—The sixth annual May lecture will be delivered, on May 4th, by Prof. W. H. Bragg, the subject being "X-rays and Crystal Structure, with Special Reference to Certain Metals."

The Institution of Electrical Engineers.—On Wednesday an "informal general meeting" of Corporate Members was held to consider the question of the expulsion of alien enemy members from the Institution. There was a large attendance. After reading a number of letters from provincial members supporting the proposal, and others on the contrary, the President stated that before calling a special general meeting to vote on the question of altering the Articles of Association, the views of the members as a whole would be ascertained by a post-card plebiscite—not a postal ballot, which was not practicable. The meeting then proceeded to discuss the various aspects of the subject at considerable length, the sitting lasting for 2½ hours. The main difficulty centred in the question whether a differentiation should be made between naturalised members of alien enemy origin and unnaturalised alien enemies, owing to the uncertainty as to the bona fides of naturalised Germans, who, if naturalised since January 1st, 1914, may, under a new German law, retain their German nationality. Eventually the President put a series of questions to the vote:—Should the voting be by ballot? Should subjects of enemy countries be expelled? Should naturalised aliens who had retained their original nationality be expelled?—all of which were carried by show of hands with hardly any dissentients. The question whether naturalised British subjects who had been subjects of a State now at war with this country, but were able to prove to the satisfaction of the Council that they had lost their original nationality, should be expelled, was answered by an overwhelming majority in the negative, and the question whether subjects of enemy countries should be barred from election in the future was carried by two to one. A Committee of Members, consisting of Messrs. Atkinson, Swinton, Gill and Rider, was then appointed to meet the Vice-Presidents (Messrs. Highfield, Russell, Smith and Wordingham) and decide upon the form of a resolution to embody the principles which had thus been laid down.

At the meeting of the YORKSHIRE LOCAL SECTION on Wednesday last a paper was read by Mr. Henry Joseph on "The Hire and Maintenance of Continuous-current Motors."

The Committee of the WESTERN LOCAL SECTION has put forward the following nominations for the vacancies which will occur at the end of the present session:—Chairman, Dr. David Robertson, Bristol; vice-chairman, Mr. R. Howard Fletcher, Cardiff. Seven nominations to fill five places on the Committee:—Messrs. F. S. Carter, Port Talbot; W. D. A. Madden, Bath; T. Mills, Melkham; C. G. M. New, Cardiff; C. F. Proctor, Cardiff; H. I. Rogers, Bath; A. L. Stephens, Stroud.

Diesel Engine Users' Association.—At the February meeting a discussion took place on the use of tar oils as fuel for Diesel engines; Mr. W. Batho, of Messrs. Sulzer Bros., and Mr. L. W. Johnson, of Messrs. Banks, Warner & Co., Ltd., who had been specially invited to attend, contributed detailed statements on the subject, and in the discussion which followed stress was laid on the importance of rendering users of Diesel engines in this country independent of the use of imported petroleum fuel oils, and of utilising the mineral resources of the country. The next meeting will be held on the 23rd inst.

A Diary of Electric Railway Operation.—A recent issue of the *Railway Review* contains an abstract of a memorandum in diary form of the inauguration of electric service between Three Forks and Dier Lodge, Mont., by the Chicago, Milwaukee and St. Paul Railway.

Reference occurs under date, December 2nd, 1915, to the running of a 1,016-ton train from Butte to Three Forks; it was calculated from the electric locomotive meter readings that the cost of handling this train from Butte to Dismal, for power, was \$1; on the same basis the amount of power returned to the line from regenerative braking between Dismal and Piedmont amounted to \$5, leaving the net cost of handling the train from Butte to Piedmont at \$4.

Under date December 7th, it is mentioned that a constructional pipe in Tunnel 11, being too near a 3,000-volt feeder, a short circuit resulted burning off one feeder, steel messenger, and two trolley wires about 800 ft. from the tunnel entrance. While attempts were being made to find the trouble, a freight train passed through the tunnel, caught the loose ends of the overhead structure and practically tore the whole thing down. Twenty men repaired this during the next 24 hours.

On December 8th, a comparison was made between two electric locomotives hauling 3,000 tons and three steam locomotives hauling 2,200 tons; the former maintained an average speed of 16 M.P.H. on a 1.66 per cent grade, while with the latter on the same road the speed was estimated to be between 9 and 10 miles an hour. The maximum A.C. demand noted during the test was 6,200 K.W., and the maximum D.C. demand, 5,400 K.W. showing an efficiency of combined motor generator sets of 87 per cent.

The memoranda cover the 10 days prior to opening the line for regular service, and the only other troubles worth recording were changing sliding members of pantograph owing to wear by trolley wire, due to its being roughened with soot and smoke; also damage to overhead structure and pantograph owing to the latter passing a trolley wire terminal. Regular operation commenced on the tenth day.

Tahiti.—According to the *Journal Télégraphique*, the French Government is installing a temporary wireless station at Tahiti, in the Society Islands, which will shortly be opened for traffic. The installation will be provided with plant of 10 KW., and will be able to communicate with New Zealand, Fiji, and Samoa. As soon as the temporary station is ready, work will be commenced on a permanent station of 300 KW., which will probably be able to communicate with Cochinchina, South America, Honolulu, San Francisco, and Sydney.

Volunteer Notes.—ENGINEERING INSTITUTIONS' V.E.C.

—Orders for week commencing March 13th, 1916.—By Lieut. Col. C. B. Clay, V.D., Commanding.

Saturday, March 11th.—Parade, Patney Bridge Station, 3 p.m.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Monday, March 13th.—Sections 1 and 2, Technical; Sections 3 and 4, Lashings and Trestle Bridging, Signalling Class and Recruits.

Tuesday, March 14th.—School of Arms, 6 to 7 p.m.

Thursday, March 16th.—Shooting for Sections 3 and 4.

Friday, March 17th.—Sections 3 and 4, Technical; Sections 1 and 2, Lashings and Trestle Bridging; Signalling Class and Recruits.

Saturday, March 18th.—Adjutant's Instruction Class at 2.30 p.m.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. G. Eastwood (Commandant), Thursday, March 9th, 1916:—

Week-end Parades.—*Saturday*—The Battalion will parade at Wembley Park at 3.15 p.m. for drill under Company Commanders. 'D-riv' Recruits are invited to attend.

Sunday—The Battalion will parade at Liverpool Street Station (low-level entrance, G.E.R.) at 9.30 a.m., and proceed by train for Entrenching duties. Members will carry their own lunch. The Battalion will return to town about 6 p.m.

Musketry.—There will be a shooting match at Bisley on Saturday next, the 11th inst., between Sergeant R. C. Davis's "A" Company team, and Acting Company Sergeant-Major Harper's "B" Company team. Targets will also be available at Bisley for other members of the Corps desirous of shooting.

All men proceeding to Bisley should report themselves to Sergeant Cotter, at the barrier of No. 6 Platform, Waterloo Station, at 12.45 p.m.

A. G. JOINER, Major and Adjutant, O.B.C.

Electric Power in Russia.—It is reported from Petrograd that a special commission, composed of representatives of the Government, commerce and industry, will meet shortly to examine the Bill prepared by the Ministry of Commerce to facilitate the development of the use of electric power in works and factories. The Bill has been prompted by the frequent crises in connection with the supply of coal in the country.

Appointments Vacant.—Shift engineers, junior engineers and attendants, station fitters, engine drivers (steam, oil and petrol), stokers and trimmers, linemen, wiremen, mates and labourers, for the Northern Command: engine driver, Llandudno electricity works; switchboard attendant, Borough of Nun-eaton electricity works; resident assistant engineer, 3 & 4 for the Bethnal Green Military Hospital. See advertisement pages to-day.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—A smoking concert was recently held in the banqueting-room of the City Hall, Cape Town, for the purpose of making a presentation to Mr. W. F. LONG on his retirement from the position of city electrical engineer. The Town Clerk presided, and was supported by many of the City Councillors. The presentation took the form of a magnificent piece of plate. In connection with Mr. Long's retirement and the promotion of Mr. S. J. CLUNAS, the present station manager, to the position of acting city electrical engineer, Mr. PURVIS, who has been Mr. Clunas's assistant for some years, has been appointed station manager.

Winchester T.C. has appointed Mr. REGINALD AYTON engineer and manager of the electricity undertaking at £400 a year, increasing by £50 a year. For five years he has been resident engineer under the consulting engineers.

The Belfast Corporation has adopted the recommendation of the Tramways Committee that Mr. A. NANCE be relieved of his duties as general manager of the Corporation tramways undertaking as and from September 1st, 1916, and appointed as consultant to the undertaking at a salary of £500 per annum.

Mr. J. W. DUGDALE, general manager of the Oldham Corporation tramways, has resigned his post.

Nelson Corporation has advanced the salary of Mr. Wm. THOMPSON, station superintendent.

Peterborough T.C. has increased the salary of the acting electrical engineer from £3 10s. to £4 per week.

General.—Mr. W. H. PATCHELL has just removed his offices to 64, Victoria Street, London, S.W.

The prize of £10 and a silver medal, offered under the Peter Le Neve Foster Trust by the Royal Society of Arts, for an essay on "Zinc, its Production and Industrial Applications," has been awarded to Mr. J. C. MORLEEN, A.R.S.M., M.Inst.M.M. Honourable mention has also been awarded to Mr. E. A. SMITH, A.R.S.M., M.Inst.M.M., Deputy Assay Master of the Sheffield Assay Office.

Sub-Lieutenant JOHN KAYE, an electrician in the R.N.V.R., was married at Dunfermline last week to Miss Margaret Summerville, of Viewfield, Dunfermline. Sub-Lieut. Kaye formerly held a position at the Ashton electricity station, and recently was engaged at Dunfermline.

It will be remembered that the members of the board of the Manchester Chamber of Commerce resigned in a body a fortnight ago upon the rejection of a report expressing the views of the board on the question of trade after the war. For the new board 29 names have been nominated for 22 seats, and among them is Mr. HARRY VERNON KILVERT, electrical engineer, of the Lancashire Dynamo and Motor Co., Ltd.

In the list of aliens to whom letters of naturalisation were granted during February are the following:—W. B. ROMMEL (U.S.A.), London, consulting engineer; A. SILD (Russia), London, electrical and mechanical engineer.

Mr. S. McFADEN, traffic manager at the Norwich Telephone Exchange, who is leaving to take up an appointment at Bournemouth, has been presented by the staff with a china cabinet.

Mr. T. GRADY, who for the past eight or nine years has had charge of the accessories section of the supplies department of Messrs. Siemens Bros. Dynamo Works, Ltd., 39, Upper Thames Street, E.C., is shortly leaving that firm to take up an appointment as commercial manager with Messrs. Trevelyan & Co., manufacturers of electrical and general engineering accessories, at 155, Bracebridge Street, Birmingham.

Mr. DAKENHAM W. BEATTY has resigned his position as chief engineer to the Laezyo Tramway Co. of Buenos Aires, which he has held since June, 1913, in order to take up the post of chief engineer to the Buenos Aires Underground Railway, belonging to the Anglo-Argentine Tramway Co., of Buenos Aires.

We are informed that the arrangements which existed between Mr. CHAS. PULLAN, consulting electrical engineer, and Mr. C. H. BEST, accountant, both of Bradford, who had been for some time co-operating in connection with a number of village electric supply schemes, came to an end on February 4th. These two gentlemen will in future work quite independently of each other.

SIR H. LLEWELLYN SMITH is to resume active duty as Permanent Secretary to the Board of Trade. Mr. W. F. MARWOOD, C.B., has been appointed Second Secretary to the Board. These changes are consequent upon the departure of Sir G. BERNES for India to take up the position of Commercial Member of the Viceroy's Council.

Roll of Honour.—Rifleman A. J. SCOTT, 1st Surrey Rifles (21st London Regiment), a clerk in the St. Marylebone electricity department, was killed in action on January 23rd.

Torpedoman DOBSON, who was awarded the D.S.M. for gallant service, recently visited his home in Accrington. It will be remembered the *Königsberg* was chased by British warships, and sought refuge in a river. While under fire Dobson (who held the position of electrician on his ship, hav-

ing charge of the lighting, &c.) played a prominent part in preventing the German cruiser escaping.

Private J. HOLLIDAY, who has been killed in action, was employed at Blackburn electricity works.

Corporal P. J. ADAMSON, whose death has occurred, at Cairo, was well known in Rochdale as an electrical engineer. He was formerly employed at generating stations at Radcliffe and Middlesbrough, and on his return to Rochdale joined his eldest brother, Mr. G. L. Adamson, in the Ohm Electrical Works. He met his death in Egypt while engaged in fixing telegraph apparatus on the railway line, being knocked down by a train.

Private LEONARD WOOD, of the 10th Lancashire Fusiliers, who, prior to the war, was employed by the Lancashire Electric Power Co., has been killed in action.

Obituary.—MR. R. A. DAWBARN.—We learn with deep regret that Mr. Robert Arthur Dawbarn, M.Inst.C.E., M.I.E.E., of Westminster, passed away on March 6th at the age of 55 years. Quite recently he suffered a complete breakdown in health, and his death occurred at a nursing home. After serving an engineering apprenticeship, and undergoing training at Glasgow, he, 35 years ago, entered the service of the British Electric Light Co., the owners of the Gramme patents. After three years he was employed on ship lighting work carried out by Mr. Raworth, and next spent a couple of years on Messrs. Siemens's electric light staff at Woolwich. He later returned to Mr. Raworth, who was then superintending engineer to the Brush Co., and while with this company he was responsible for the details of many Brush electric lighting schemes. He did not limit his attentions to this country, for, as a matter of fact, certain of his Brush activities took him to Australia, where he amalgamated several electrical concerns, and studied electrical affairs generally. Some 16 years ago Mr. Dawbarn left the service of the Brush Co. and joined Mr. W. M. Mordey in partnership, in the business of Mordey and Dawbarn, consulting engineers. He was in this capacity engaged at different times upon various public and other electrical projects and works, and the firm's operations frequently took him on visits to South America, South Africa, and elsewhere. Mr. Dawbarn was a man who until quite recently betrayed no signs of giving out, and we must reckon him among those who have succumbed to the stress and strain of trying years before the completion of what seemed to be the allotted span. His death will be regretted by a large circle of friends in the electrical world, and we tender our sympathy to his partner, Mr. W. M. Mordey.

Will.—The late Mr. Z. MERTON (H. R. Merton Co.) left £149,865 gross and £121,889 net.

NEW COMPANIES REGISTERED.

Company of Electric Caterers, Ltd. (143,181).—This company was registered on March 3rd, with a capital of £1,500 in £1 shares, to carry on the business of bakers, confectioners, and millers, dealer in flour, meal, and other breadstuffs, corn merchants, suppliers of refreshments, caterers, manufacturers of and dealers in aerated and mineral waters, tea, coffee, cocoa, and chocolate, grocers, tea dealers, &c., to conduct the business of the company for the benefit of the ticket holders, or associated as well as of the shareholders; to provide a public hall in the parish of Hendon or elsewhere, and to adopt an agreement with H. S. Cooper and A. G. Raymond. The subscribers (with one share each) are: H. Crump, Quarndon, 8, Ashbourne Avenue, Golders Green, N.W., chartered surveyor; J. M. Lickfold, Cross Roads House, Golders Green, N.W., solicitor. Private company. The number of subscribers is not to be less than five or more than nine; the first are H. S. Cooper, A. G. Raymond, W. L. Raymond, H. Crump, B. G. Drummond, H. A. Welch, and J. M. Lickfold. Registered office: The Refectory, Finchley Road, Golders Green, N.W.

Launa British Electric Co., Ltd. (143,140).—This company was registered on February 28th, with a capital of £1,000 in £1 shares, to carry on the business of electrical and general manufacturers and contractors, designers, makers and producers of electrical glow lamps, appliances, fittings, cables, tubes, liquid, and solid compositions, powders, and flexible wires, &c. The subscribers (with one share each) are: D. Schofield, 206, Lauderdale Mansions, Maida Vale, W., advertising contractor; F. O. Langton, 61, Call Lane, Leeds, builders' merchant. Private company. The number of directors is not to be less than two or more than five; the first are F. Dove (permanent governing director) and D. Schofield. Qualification, £20. Secretary: M. J. Dove, 78, Louis Street, Leeds. Registered office: 61, Call Lane, Leeds.

Caton Electric Supply Co., Ltd. (143,150).—This company was registered on February 29th, with a capital of £2,000 in £1 shares (£100 6 per cent. cumulative), to carry on at Caton and elsewhere the business of an electric light and supply company in all its branches. The subscribers (with one share each) are: C. H. Best, 72, Market Street, Bradford, incorporated accountant; J. T. Walker, Brookhouse, Caton, grocer, &c.; T. H. Mattinson, Caton, near Lancaster, boot and shoe store-keeper; N. A. Foster, 1, Cheapside, Bradford, solicitor. Private company. The number of directors is not to be less than two or more than five; the first are C. H. Best and N. A. Foster. Qualification, 25 shares. Solicitors: Gaunt, Foster & Co., 1, Cheapside, Bradford. Registered office: 72, Market Street, Bradford.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Strode and Co., Ltd.—Particulars of £4,000 prior lien debentures, created February 23rd, 1916, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount now issued. Property charged: The company's undertaking and property, present and future, including unsold capital, ranking in priority to £15,000 existing debentures, and a further issue of £2,500 like debentures. No trustees.

CITY NOTES.

Harrow Electric Light & Power Co., Ltd.

During 1915 80 new installations (126 k.w.) were connected. The consumers now number 1,704, taking 1,862 kw. (aggregate), and the output for the year was 530,107 units. The net revenue balance, after deducting debenture interest and the interim preference dividend, was £2,402. The final preference dividend absorbs £375, 5 per cent. is to be paid on the ordinary shares, and £360 carried forward. At the annual meeting on February 22nd, Mr. J. N. STUART, the chairman, said that in spite of the lighting restrictions the sales showed a falling off of only 8,000 units, about 14 per cent., which had been almost compensated for by a slight alteration in the method of charging during the past half-year. As long as the war continued they must be satisfied if they could hold their own. He could offer no great prospects for the coming year; they would do their best to maintain the dividend until brighter days, and therefore brighter nights, came for the country. Mr. G. SPENCER HAWES, seconded, and said that for eleven consecutive years they had maintained their 5 per cent. dividend.

For the year ended January 31st, 1916, the profit, after deducting administration expenses, was £39,819 (last year £39,001). There has been transferred to the credit of reserve account £11,000. The balance brought forward was £14,212, so that the available profit is £43,030, as compared with £40,612 for 1914. After paying 8 per cent. on the ordinary shares, as in the previous year, £17,130 is to be carried forward. The balance of the dividend now being paid is to be paid less income-tax. Additional plant for Weardale power station is making satisfactory progress at the manufacturers' works, and extensions to Grangetown power station will be completed three or four months' hence. The supply of waste heat and gas, and consequently the output of electrical energy, has been less than in 1914. The costs, however, have been less owing to the smaller amount paid to the owners of the collieries and ironworks. The company took up £10,000 4½ per cent. war loan, and exchanged its 3½ per cent. War Loan into 4½ per cent. Annual meeting: March 8th.

Lancashire United Tramways, Ltd.

Presiding at the annual meeting on February 29th, the Hon. ARTHUR STANLEY, M.P., referred to the satisfactory result of the working for the year, notwithstanding the increase in expenditure caused mainly by the extra cost of materials, war bonuses to employees, and amounts paid to dependents of men with the Forces. 130 men were serving in the Colours, but up to the present the usual service of cars had been maintained through the employment of female labour, which was proving satisfactory. Since the early days of the war the staff and employees had made a regular monthly contribution to the funds of the British Red Cross Society, averaging over £25 per month, and amounting in all to over £300. Mr. Stanley (who is Chairman of the Joint War Committee of the British Red Cross Society and the Order of St. John of Jerusalem in England) took the opportunity of publicly thanking all those who had thus so generously helped in the work of transporting sick and wounded soldiers.

British Engine, Boiler, and Electrical Insurance Co., Ltd.

Presiding at the annual meeting, held at Manchester last Friday, Mr. R. C. LONGRIDGE commented on the substantial growth in income from inspection charges and premiums in all the principal departments of business, amounting to £117,112, against £112,465, which, occurring in the first year of management of Mr. Harry M. Longridge, gave great satisfaction, especially having regard to the disturbance of business conditions and the absence of 44 members of the staff with the Colours. The profit showed a slight reduction, outgo being a little in excess of the average owing to the increased cost of repairs and to a war bonus payment to the staff, while the company's charges remained unaltered. Provision was made for carrying £5,000 to reserve for current risks and writing £7,250 off investments and furniture, leaving a balance of £11,521, and after providing for the final dividend, the total funds amounted to £177,925.

Electrical Distribution Co. of Yorkshire, Ltd.

Mr. R. W. WICKHAM, presiding at the annual meeting on February 29th, said that in view of the increased costs, the lighting restrictions, and other difficulties due to the war, the results were very satisfactory. The capital expended during the year was £6,173; the policy of restricting such expenditure would, under the circumstances, be continued. The consent of the Treasury was being sought to make a further issue of capital, and, if approval were obtained, a *pro rata* allotment to present holders would be made. The last issue was over-applied for. They believed that future years would show the same steady progress as in the past. The new lighting restrictions would doubtless further affect the revenue, but their conservative policy would enable them to overcome present difficulties without any serious effect upon the year's trading.

Bournemouth and Poole Electric Supply Co., Ltd.

During the year 1915 the revenue, after deducting generating and distribution costs, rent, rates, taxes, wages, &c., is £38,684, plus £3,820 brought forward. Debenture and other interest absorb £11,375, there is put to reserve for depreciation £8,000, 34 per cent. is paid on the first and 6 per cent. on the second preference shares, also 6 per cent. on the ordinary, £3,607 remaining to be carried forward. The total applications received amount to 10,549 kw., an increase of 885 kw. for the year. The units sold for all purposes numbered 4,061,091. Units generated, 5,182,458; 161 public lamps used 2,034 units. The dividend declared by the Richmond (Surrey) Electric Light & Power Co., Ltd., was 6 per cent. on the ordinary shares.

India-Rubber, Gutta-Percha, & Telegraph Works Co., Ltd.

A circular has been issued to the debenture and shareholders respecting the £400,000 4 per cent. first mortgage debentures, which fall due for payment on March 15th, 1916. It is proposed (the Treasury raising no objection) to make a new issue of 1,000 first mortgage debentures of £100 each at 5 per cent. at the price of 93, repayable at £100 in March, 1926. Holders of the existing debentures will have the preferential right of taking up the new issue to the amount of their present holdings, so that each holder who exercises that right will receive a new £100 5 per cent. debenture and a payment of £7 in cash per £100 now held. The directors ask the shareholders to support the scheme, and point out that it is to their interest to make it a success. It is important that the company should not be hindered in its operations, and it is difficult for any company to raise fresh capital at present.

Northampton Electric Light and Power Co., Ltd.

Presiding at the annual meeting on March 2nd, Ald. F. H. THORNTON welcomed the shareholders to the new offices. The meeting was held in the new demonstration room. The company had experienced a very strenuous year. Twenty per cent. of the outdoor staff and 45 per cent. of the indoor staff had enlisted, and a great deal more work had devolved upon those who had been left behind. The company was supplying more motor power than ever before, and if it had not been for the fact that they were able to install it within 24 hours many shoe manufacturers would not have been able to complete their Government orders. Therefore they had not only served the town well, but also their country. The site for the erection of a new generating station was one of the most important that could have been obtained; it would give river water for cooling purposes, and they would be able to expand as necessity arose. The fact that the Town Council had now consented to allow them to take the mains along the towing path, the nearest route to the town, had saved them several hundreds of pounds. The site was rather subject to floods, but that would be got over by raising the works above the level of the floods. As to when they would go on with the erection of the station, that depended altogether upon circumstances. They had made arrangements to add another large engine to the works, but that could be put in at the present station or at the new one, as was most convenient. Alternating current would be generated at the new station, and it would be transformed at the present station. They did not raise the price of current until nine months after the Gas Co. had raised the price of gas, and not until a long time after many other companies in the country. That was due to the very advantageous coal contracts they had secured. 85 per cent. of the current they supplied was for motor power. The board of directors proposed that Mr. A. E. Marlow, J.P., a prominent beet manufacturer, should be added to their number.

Telegraph Construction and Maintenance Co., Ltd.

At the annual meeting, on March 2nd, Sir JAMES PENDER, who presided, referred to the loss that the board had sustained by the resignation of Lord Selborne consequent upon his having accepted office in the Government. The profit for the year was £108,708, as compared with £109,186 for 1914 and £114,863 for the year before the war. Adding £111,406 brought forward, they had a total of £220,114. After paying dividend and bonus of 3s. per share, in addition to 12s. per share interim dividend already paid, and putting £20,000 to the reserved fund, £10,474 was to be carried forward. The past year had been far from normal. Contracts entered into before the war began had to be postponed on account of urgent Government requirements, and it was not until many months had elapsed after the contract dates that they were able to complete the work which they had undertaken. They had much to which to thank their clients in the way of patience and forbearance in face of the serious inconvenience to which they had been subjected by these delays. They had been working under exceptional difficulties all the year, both on account of scarcity of labour and shortage of supply of materials, and ever-increasing prices of both, but they had managed to keep their manufactured output quite up to the average of previous years. They had done a good deal of work for the Government as well as their ordinary business. Their profits had been comparatively small, rather less than last year, and considerably less than the year before the war, so they would have no excess war profits to return as payable under the Finance Act; in fact, but for

the good rates of interest which they had been getting for money, and the profit realised on the sale of some American dollar securities, they would not have been able to show so good a result. Their ships had been actively employed throughout the year and had often had to carry on their work within the danger zone, but, thanks to the foresight of the Admiralty and their provision of the naval escort which was necessary for protection, the ships had gone through the year without any mishap.

London United Tramways, Ltd.

The gross receipts in 1915 were £200,166. After adding the balance brought forward and deducting all expenses chargeable to revenue, including an appropriation of £25,000 to reserve for reconstruction and renewals, there remains £2,327, which is to be carried forward. The reconstruction of the line between Brentford and Hounslow, commenced in 1911, was completed, and the entire cost of the work has been charged against the reserve for reconstruction and renewals. The car-repair work previously carried out at the Chiswick Depot has been removed to other depots. Passengers carried 63,145,226, as against 61,633,783 in 1914; car miles run 7,744,894, as against 8,996,891; average receipts per passenger 12d., as against 117d. Annual meeting: March 15th.

London and Suburban Traction Co., Ltd.

The revenue for 1915, consisting almost entirely of dividends and interest receivable from the subsidiary companies, amounted to £122,430, as against £118,580 for 1914. After deducting all expenses chargeable to revenue, including debenture and loan interest, and providing for the sinking fund charges on the 5 per cent. debenture stock, £80,755 remains, plus £2,886 brought forward. After paying the full dividend on the 5 per cent. cum. pref. shares, £3,483 remains to be carried forward. During the year £9,317 5 per cent. debenture stock was purchased and cancelled under the operation of the sinking fund provided for in the trust deed constituting the stock, thereby reducing the amount outstanding to £338,683. Annual meeting: March 15th.

Tramways, Light & Power Co., Ltd.

VISCOUNT CHILSTON presided on February 29th at the annual meeting, and said that they had represented in the accounts a full year's trading under war conditions. Notwithstanding the difficulties due to the war, the companies in which they were interested had made progress, but the progress was largely counteracted by progressive increases in the cost of production, and particularly in the cost of fuel. They were of opinion that they had lived through their worst year in 1915. The various undertakings had only to continue the present rate of earnings to show a considerable increase during the current year, and the increase should continue for some time unless, after peace was declared, a very substantial change for the worse came over the country. The Derbyshire and Nottinghamshire Electric Power Co. developed slowly during the year, but the increased receipts were rather more than offset by increased costs, the net receipts being about the same as in 1914. During 1916 increased returns would be derived from this company from business connected last year too late to affect the return for that year. The Leicestershire and Warwickshire Electric Power Co. last year showed considerable improvement, and during the last few months of the year a substantial increase in net earnings. Judging by present results, this property would contribute a substantial increase during the current year to the revenue of this company. Last year he said that a large additional revenue could be earned from the money already expended on the power properties, and this statement had been amply justified during the year, additional consumers having been connected to the Power Companies' mains equal to about £10,000 receipts per annum. Their various properties showed a substantial increase in earnings for the present year to date compared with the corresponding period of 1915. They might reasonably hope, therefore, that the current year, unless something very unforeseen occurred, would show a satisfactory increase over last year.

Metropolitan Electric Supply Co., Ltd.

The capital expenditure during 1915 was increased by £30,142. The gross revenue was £229,201, an increase of £13,656; working expenses £127,150, an increase of £12,538. The balance at the credit of the revenue account before providing for depreciation is £102,051. £27,000 has been set aside as an addition to the depreciation and reserve fund, which, after writing off loss on realisation of certain investments, now amounts to £337,359; the net revenue is £75,051, and adding the amount brought forward, interest and dividends on investments, and other receipts, the total is £87,089. After deducting debenture charges, preference dividend &c., £34,978 remains. Out of this, 3 per cent. for the year is paid on the ordinary shares, and £4,978 is carried forward. New connections during the year represented 50,267 (25 c.w.) lamps (1.778 kw.), making the total 1,197,763. In October, Messrs. G. Blackwell, G. A. Moncrieff, and P. D. Tuckett were elected directors, and in January, Lord Avedbury, Sir J. Pender and Mr. Tuckett resigned. Mr. J. S. Highfield has resigned his position as engineer and manager, and has been appointed consulting engineer. Capt. W. R. Rendell has been appointed general manager. Annual meeting: March 22nd.

Metropolitan Electric Tramways, Ltd.

The revenue for 1915 was £513,561. After adding the balance brought forward and deducting all expenses chargeable to revenue, including a provision of £22,715 for reconstruction and renewals, the available balance is £44,275. There is placed to reserve £13,000; preference dividend absorbs £25,000; a dividend of 1 per cent. is to be paid on the ordinary shares, and £1,532 is to be carried forward. £10,275 4½ per cent. and £1,020 5 per cent. debenture stock have been bought and cancelled. The strike in May last caused a loss in traffic receipts of £16,000. Wages will show a material increase as the result of further concessions granted to the staff in December last under an arbitration award. The output of the North Metropolitan Electric Power Supply Co., in spite of the decrease in the number of units supplied for traction purposes, has been satisfactorily maintained; the total units sold were 39,457,712, as against 36,869,118 in 1914. Owing, however, to the abnormal increase in the cost of fuel, the gross profits of the Power Supply Co. for the year show a decrease of £6,340 as compared with 1914. The company is promoting a Bill in Parliament to extend the times limited by certain Acts. Passengers carried 89,656,054, as against 93,325,170; car miles run 9,686,525, as against 11,479,592; average receipts per passenger 1.23d., as against 1.20d. Annual meeting: March 13th.

Notting Hill Electric Lighting Co., Ltd.

MR W. CROOKES, O.M., P.R.S., presiding at the annual meeting on February 29th, said that, notwithstanding the war, the result of the year's work had been satisfactory. The £1,556 spent on capital was almost entirely for meters and mains for new connections. They had only extended the mains where absolutely necessary, and at present they would keep expenditure on new work at the lowest possible figure. The revenue rose by £330, and the expenses by £779. The increase in revenue was partly due to new business and partly to an extra halfpenny per unit charged on the lighting supply during the last nine months. The total cost of generation and distribution advanced by £1,200, although the units sold were 100,000 less. The increase had been partly nullified by decreased management expenses due to Mr. Schultz's retirement; the secretary now combined the offices of manager and secretary. The net result was a drop of £450 in the profit for the year. The balance available for dividends was lower by £1,185, owing to the heavy increase in the income-tax. The total of the Kensington and Notting Hill Joint Debenture Stock sinking fund was £72,920 held in trustee securities. In view of the alarming fall in such securities, owing to the war, they had recently investigated their position in this respect. Owing to the fact that the bulk of the stock purchased was terminable, and was due to be paid off at par at maturity in or about 1931, and that that was the date at which the joint debenture stock had to be redeemed, although present-day prices showed considerable reduction, it would make no difference to the fund, as they would not have to sell the stocks, but just to encash them at par. In the case of the irredeemable securities, of which they had but a small amount, there was a loss estimated at about £1,900, so that they suffered very little by the shrinkage of value. The sinking fund was now being invested in the War Loan. The number of houses connected had risen from 4,293 to 4,358; the units sold fell from 2,539,412 to 2,436,496; the revenue rose from £45,591 to £45,921, and the expenses from £21,370 to £23,304. They had added the equivalent of 4,373 30-watt lamps to the system, and the profit was £22,617, against £24,221. They paid the same dividend as for 1914, but carried forward only £336, as against £655. They had suffered considerably owing to the restricted lighting, and although they had managed to maintain their revenue in the past he was not certain that they would be able to do so this year. When peace was proclaimed their output should largely increase, owing to the removal of restricted lighting regulations and the new lamps that were being constantly added. Expenses must necessarily be high for some time to come, and they were swollen to some extent by increases of wages and payments to employés with the Forces. They had now obtained delivery of the new steam turbine for Wood Lane works; it would save coal, and in a large measure counteract the high price of fuel. The company was doing its share in connection with the war. He hoped that a satisfactory peace would be obtained before their next meeting, and when that time came the company would maintain its prosperity. If the war were prolonged the temporary set-back in their accounts should not be serious. The chairman alluded to the debt of gratitude owing to the special constables who had guarded their stations.

Rushden and District Electric Supply Co., Ltd.—Presiding at the annual meeting, held at Northampton on March 2nd, Ald. F. H. THORNTON said that few people realised what go-ahead places Rushden and Higham Ferrers were. The company were supplying many factories and workshops with power. Six boot factories were now completely lighted with electricity. The number of customers had been increased from 79 to 123. The revenue from sale of current had increased from £463 to £1,699, and the output had been doubled. For the first proper working year, he thought the company was doing well in being able to pay 3 per cent. interest.

Minehead Electric Supply Co., Ltd.—The directors report that 1915 was a difficult year. Public lighting restrictions led to a considerable reduction in lighting units sold. There had, however, been a good increase in units sold for heating and cooking, and the total units sold were 230,416, as against 224,629 in 1914. Units generated, 360,079. The average price obtained fell from 3.54d. to 3.40d.; there had also been an increase in cost of materials and working expenses, so that there was some reduction in profit. The result was, however, satisfactory. The profit on trading, after paying debenture interest, &c., was £1,753, plus £145 brought forward. After paying the preference dividend and 8 per cent. on the ordinary (less income-tax), and placing £1,000 to depreciation and reserve, £112 was to be carried forward.

British Electric Traction Co., Ltd.—The directors have declared the dividend on the 6 per cent. cumulative preference stock for the half-year ended September 30th. This dividend must be accepted as a payment on account of the dividend on the 6 per cent. cumulative participating preference stock to be issued in place of the 6 per cent. cumulative preference stock of the company upon the confirmation of the scheme of arrangement and reduction of capital by the Court.—*Financial News*.

Bruce Peebles and Co., Ltd.—The total profit for 1915 was £14,916, and after deducting administration expenses, interest on mortgage debentures, and allowing for interest on the unsecured debentures, the net profit is £7,096. Having regard to the abnormal times and difficulties, the results are considered satisfactory. £4,661 has been charged to profit and loss in respect of repairs and maintenance of buildings, plant, and machinery. Annual meeting: March 10th.

W. T. Henley's Telegraph Works Co., Ltd.—The directors recommend a final dividend on the ordinary shares of 10 per cent., less income-tax, making 15 per cent. for the year, and also a bonus of 10s. per share, less income-tax, as compared with 15 per cent. and a bonus of 5s. per share for 1914.

Dublin and Lucan Electric Railway Co.—For 1915 the gross receipts were £7,511, increase £144. Expenditure increased by £208. After providing for debenture interest, £528 is to be carried forward. Payment of the cumulative preference dividend is postponed for the present.

North Metropolitan Electric Power Supply Co.—According to the *Financial News*, the directors recommend a dividend of 6 per cent., with a bonus of 4 per cent., making 10 per cent. for the year. £15,000 is put to renewals reserve, and £6,043 is carried forward.

Midland Electric Corporation, Ltd.—Dividend of 3 per cent. on ordinary shares for 1915. £9,719 is put to depreciation, £4,275 to writing off new issue and construction expenses, and £8,932 is carried forward, subject to excess profits tax.

British Insulated and Helsby Cables, Ltd.—The dividend on the ordinary shares for 1915 is made up to 15 per cent., plus 2½ per cent. bonus. For 1914, 15 per cent. was paid. £98,500 is placed to reserve, and £160,000 carried forward.

Canadian General Electric Co., Ltd.—Quarterly dividend of 1½ per cent. for the three months to March 31st on the common stock.

Manila Electric Railroad and Lighting Corporation, Ltd.—Dividend of 1½ per cent. for the quarter ending 31st inst. on the common capital stock.

Globe Telegraph and Trust Co., Ltd.—Interim dividend 2s. per share, free of tax, on ordinary shares for the quarter.

Brazilian Traction, Light and Power Co., Ltd.—Quarterly dividend 1½ per cent. on the cumulative preference shares.

British Electric Transformer Co., Ltd.—Dividend on the ordinary shares 7½ per cent. for 1915.

STOCKS AND SHARES.

TUESDAY EVENING.

The three principal factors in the Stock Exchange market at present are the battle of Verdun, the calling up of the Derby groups, and the new British War Loan. Such fierceness on the part of the enemy as he is displaying at Verdun is taken as a sign of his desperation to effect something brilliant in order to bring in subscribers to the latest German war issue, and to achieve some success that will cheer his people at home, sick of slaughter as they must be, and growing restive as they are beneath the burdens of taxation and privation. The enactment of the further Derby groups checks Stock Exchange business from a large part of the community which provides it as a rule; while, as to the third factor, there is no need to emphasise its importance.

Taking them all round, markets are surprisingly firm; and amongst electricity sections, the splendid results secured by the Henley's Telegraph Works and the British Insulated and Helsby Cables Companies have led to further appreciation in the prices of the shares. Electric lighting issues are slightly easier. Falls of ¼ in Brompton ordinary, of ½ in Charing Cross preference, and of 1/16 in South London shares, are the outstanding movements of the week.

The South London report shows that the company did satisfactorily last year. The sale of current was higher, but gross revenue went down a trifle, and net income, at £27,200, is £2,000 down on the year, net profit being £11,900, or £1,500 less than in 1911. The dividend is maintained at 5 per cent., as already noted; and the carry-forward of £2,000 is about the same as before.

The County of London Electric Supply Co. has issued an excellent report. Gross receipts have risen £24,000 to £268,300, but these were countered by extra expenses, and the net revenue of £159,000 is £11,000 less. The dividend is maintained at 7 per cent., the same as that of the previous twelve months; and the carry-forward of £14,500 is £2,000 more than that of a year ago. The report shows that during 1915 supply was commenced in Romford, and that the company is now giving supply in bulk to Sutton, Carshalton, Wallington, and Chessington. Increased expenditure is beyond the power of any management to control at a time like the present, and the County of London shareholders may be congratulated upon the skilful way in which their company is being steered through so trying a period.

The new orders with regard to the lighting of London come into force at the end of this week, but it is not thought that they will have much effect upon the output of the electric lighting companies.

The domestic troubles to which we referred last week, in connection with one of the principal London companies, are made plainer; and it is expected that the meeting of the Metropolitan Electric Supply shareholders may show a "certain liveliness," to quote the Admiralty's classical phrase.

The W. T. Henley Co. has raised its dividend and bonus from 20 per cent. to 25 per cent., and the shares are nominally 10s. higher at 14½. In point of fact, however, it is extremely difficult to get the offer of any shares at all, which, in the circumstances, is not surprising. Having regard to the dividend accrued in the price, the return on the money is getting on for 9 per cent., allowing for the fact that the distribution is made free of income-tax.

The British Insulated & Helsby Cables, Ltd., has declared a dividend of 10 per cent., making 15 per cent. for the year, with a bonus in addition of 2½ per cent., and here again, although the nominal price is 11, the difficulty is to get the offer of shares. In both concerns the appropriations are large, and assist substantially in fortifying the financial positions of the undertakings.

The market for Manufacturing issues as a whole is naturally a good one, in view of these fine results. British Westinghouse preference recovered 6d. to 44s. 6d., and British Aluminium ordinary are 9d. better, although there is not much change in other shares. India-Rubber ordinary are not affected by the notice just issued to holders of the company's 4 per cent. first mortgage debentures, who can exchange into new debentures, bearing interest at 5 per cent., at the price of 95. Holders of the existing debentures will have the preferential right to take up the new issue, as they are offered £7 per cent. in cash upon their making application to the company. Having regard to the nature of the security, we should imagine that there will be little hesitation on the part of the holders in exchanging their old 4 per cent. into the new 5s.; and the return of 5½ per cent. on the money is raised to 6 per cent. by the new debentures being redeemable at par in 11 years' time.

The various stocks of the Underground Electric Railway companies keep comparatively steady, but attract little attention from investors speculative or otherwise. It is noticeable, however, that a good many people are picking up low-priced railway stock, particularly that of the District order, regardless of dividends, evidently with the intention of putting it away to await a rise in price (that shall be equivalent to a dividend) after the conclusion of peace.

Underground Electric income bonds at 81½ are ex their £3 dividend, and the shares are a trifle easier, as will be noticed in our usual list of electricity stocks and shares.

Brazil Traction have receded to 50½, and the Mexican group is still decidedly dull. British Columbia preferred is rather harder. Of the Colonial issues, Melbourne Electric debenture stock is wanted, and has been done at 95½. The Anglo-Argentine Tramways group is steady. Rio Tramways first mortgage bonds are firm at 88½, and the seconds are changing hands on the basis of 74.

The telegraph list is unusually free from fluctuation. Indo-Europeans are ½ higher at 19½. Anglo-American Telegraph deferred went back 1, and this is the sum of the changes on the week. American Marconi's hardened to 15s. 9d. For New York Telephone ½ per cent. bond the Government bid is still 100½. The Eastern group is firm, with little stock on offer; and the Globe issues hold their previous improvements.

The Stock Exchange followed with keen interest the suspension of dealings in the base metals used in connection with the war, and the Government action in re-establishing the market after-wards came as something of a relief, inasmuch as the House was slightly apprehensive lest the same sort of treatment might be meted out to itself. The copper group is a little heavy. In rubber shares there is continued animation and strength. Business is not on quite as large a scale as it was a fortnight ago, but the rubber market is the busiest section of the Stock Exchange, and all classes of shares are wanted by the speculative investor as well as by the speculator pure and simple.

WHAT TO DO WITH OUR CANALS.

By W. N. STEWART.

In the coming trade regeneration of the nation it is certain that a reform of existing methods of internal transport will be a question demanding serious consideration, as present conditions too seriously handicap the business and industries of the country. With railway rates for goods traffic from three to six times greater than similar rates in America and on the Continent, with unused canals and with common roads not utilised to their full value, it is small wonder that British trades have fallen far behind their rivals in the race for commercial supremacy, especially when they have had to compete with nations in which the study of transportation problems has reached the dignity of an exact science.

Before considering the matter which is the subject of this article, let us study the transportation problem as it affects one small community which is typical of thousands of others throughout the land.

The present writer lives in a market town located some 35 miles from Manchester, which, for the purposes of this article, we will call by the name of "X." This town is modern and up-to-date in all its municipal undertakings, has a population of some 18,000, and is both a manufacturing and agricultural centre. Its principal market is Manchester, the great distributing point for Midland trade. "X" is served by a single railway system and by a canal belonging to the railway company, this canal being so little used that it scarcely counts as a factor in the transportation problem. Therefore, the inhabitants of "X" and the towns round about, including several large cities, have to pay toll to the railway on nearly everything they buy, sell or consume, this toll amounting to £2 6s. 8d. on each ton of goods sent, *at owner's risk*, by passenger train to or from Manchester, and from 15s. to 30s. per ton by goods train, according to class of goods. Parcels of limited weight, by passenger train, are delivered in from four to eight hours after sending, while merchandise sent by goods train may arrive in from two to four days after dispatch. To make this situation clearer, it may be fairly considered that it costs as much to send a ton of provisions from Manchester to "X," a distance of 35 miles, as it does to send the same ton from New York to Manchester, a distance of 3,000 miles, that is, at pre-war rates. The charge in the first case is due to the action of a monopoly, while in the second case the seas are free to all, and competition follows the natural law.

How can the canals be best used to reduce these excessive costs, to eliminate the question of monopoly, and to secure the modern requisite of greater speed in delivery?

In the report of the late unlamented Canal Commission, as published in the ELECTRICAL REVIEW at the time, it was shown that the best system of canal electrification now in use is one in which rails are laid on the towing path of the canal, electric locomotives supplied with current from generating stations through trolley wires being used to tow boats at a preferable speed of *two miles per hour*; that such a system would cost something like £8,000 per mile to establish, and that an average traffic of at least two million tons per annum would have to be obtained in order to pay expenses. These estimates evidently did not take into full consideration the fact that in many places British canals would have to be entirely reconstructed, as in some places no towing paths exist through tunnels, while to propose a speed of two miles per hour in this twentieth century smacks a bit of the farcical. The principal difficulty, however, was never even considered, and probably was not even discerned, by this sapient Commission, and that is that a canal system, like a railway system, does not do the *whole* work of transportation be-

tween the producer and the consumer, but only forms one link in the chain. For example, in order to send a ton of groceries from the wholesale dealer in Manchester to the retailer in "X," the goods must be loaded on a lorry in Manchester, then unloaded at the goods station in Manchester, then loaded on boat or train, then unloaded at "X" goods station, then loaded on a lorry, then unloaded at the premises of the retailer. That is, the ton of groceries has had to be handled *six times* over, and if the transit over the streets of Manchester and "X" has been effected by means of horsed vehicles, this part of the work has cost *more than twice* the cost of that part of the work performed by rail or canal, a cost which, of course, comes out of the pocket of the man who consumes the tea, sugar, or bacon so transported.

There is, however, thanks to the growing understanding of modern methods, a much better system.

Let us at once drain the canals and abolish their use as water-ways. Then pave them for use as motor roads, filling in the locks in such manner as to form gradients not exceeding one in twenty. Let the value of the canals be suitably appraised, and to this value add the cost of necessary alterations, which would not exceed £800 per mile, this sum to be found by the Government. From each vehicle using these roads exact a toll varying with the load capacity of the vehicle, this toll being divided between the owner of the canal and the Government on an equitable scale, thus avoiding an actual expropriation of the canals and giving their owners a substantial income in place of the small return at present obtained. Then confine the use of the canal roads to *electrically propelled commercial vehicles only*, pleasure, passenger, and petrol cars being absolutely excluded. The reasons for this exclusion are that the roads would be intended for commercial purposes only; that it is inexpedient to interfere with the passenger and long-distance goods traffic of the railways; that the scheme is intended to benefit British trades and not to fill the pockets of the Standard Oil or other foreign petrol producers; and, last but not least, because experience in the use of electrically propelled vehicles has conclusively demonstrated the fact that their cost of operation is far below that of petrol cars, and their reliability greater. As the use of the canal should be based on sound economic principles, the cheaper power must be employed. Plenty of statistics are available as to the relative economy of petrol and electrical systems, but with these the present article need not be cumbered.

In the operation of such a system, the Manchester wholesaler would load the electric truck at his warehouse, and using the streets of Manchester, the canal road and the streets of "X," the truck would unload at the door of the retailer in "X," the goods thus being handled *twice* in place of *six* times as at present, while in some cases the retailer would be able to deliver goods to the actual user without any rehandling. During the greater part of the journey from Manchester the vehicle would run on the almost dead level surface formed by the canal bed instead of having to climb the terrible hills prevalent in this part of England, the former condition being almost ideal for accumulator traction. The time of transit from Manchester to "X" would not exceed four hours, giving quicker delivery than is now usually obtained from the passenger train service, while the cost would vary from 6s. to 15s. per ton, in place of the £2 6s. 8d. now paid for small parcels by passenger train, and from 33s. to 60 per cent. less than what is now paid for the slow service by goods train.

Another advantage of this proposal is that the Government would in no case be called upon to face an enormous expenditure, such an expenditure being only justified by absolute knowledge in advance that sufficient tonnage would be available to enable the scheme to pay its way. In the scheme above outlined, the heaviest cost—that of the vehicles—would

be borne by the users thereof and be incurred gradually as the economy secured became known, the large firms buying their own vehicles and smaller ones combining on the co-operative system. The Government would, therefore, contribute only the small cost of making the road on a bed already graded. As the roads would be national and free to any electrical commercial vehicle paying the toll, no traffic monopoly could be established, as is now the case at sea. And as Britain's external trade has been built up on this freedom of the seas, which freedom Britain has latterly been at some cost to maintain, so would internal trade be built up by a system of transit which could not be monopolised. This is true because goods would not only be transferred from Manchester and other distributing points, but manufactured goods, farm produce, etc., would be carried to the distributing and shipping centres, the canal roads forming the arteries of a vast collecting and distributing system, the common roads—reaching every hamlet and every farm in the land—forming the veins.

The effect on the electrical industry would be most salutary. Thousands of workmen would find employment in the construction of motors, vehicles and batteries, while the generating stations, municipally owned or otherwise, would find "peak" loads a thing of the past. In fact, it might prove that the sale of current for lighting would become quite subsidiary to the sale of current for charging accumulators.

But over and above the interests of any one industry, the welfare of the nation should be first considered, and efforts should be made by Chambers of Commerce, municipal authorities, and trade societies in general to show our rulers that *Great Britain now has in existence the finest system of highways in the world*, ready excavated, graded and tunnelled, which can, at insignificant cost and with minimum delay, be made available for the use of the *cheapest known form of traction*, and one which does the *whole job* of transport between manufacturer or wholesaler and retailer or consumer. And not only home trade would get the advantage of these roads: export business would likewise benefit by cheap transit from factory to dock, thus helping to maintain British trade supremacy over seas.

CONTINUOUS-CURRENT RAILWAY MOTORS.

By E. V. PANNELL, A.M.I.E.E.

(Abstract of paper read before the INSTITUTION OF ELECTRICAL ENGINEERS.)

THE railway motor is a piece of machinery liable to very severe usage, and its design and construction in accordance with its service conditions form an interesting study.

The object of this paper being to consider general tendencies in design, the curves and tables should be regarded as representative of such tendencies rather than of precise quantities.

In the last few years considerable improvements have been effected in design. In figs. 1 and 2 the dotted curves represent the average weight of the railway motors in general use up to about the year 1909, whilst the full lines show the weights of motors of similar output designed since this date and in operation to-day. The latter are almost all of the commutating-pole type.

Dead-weight is an objectionable feature in the motors where these are suspended directly upon the trucks. The nose form of suspension in general use throws about half the weight of the motor upon the axle without any intervening springs. Moreover, owing to the motor armature rotating from three to four times as fast as the wheels, the energy stored up in it during the accelerating periods will be very considerable, and for this reason minimum weight and armature speed are desirable. A typical calculation for the value of this momentum has been worked out by Mr. E. W. Carter.

A motor introduced in 1910, rated at 48 kw., weighed 2,735 lb., or 800 lb. less than a motor of the same output, but six years older.

This reduction has been secured partly by the increase of

rated speed made possible by the adoption of commutating poles, but to a greater extent by the use of more carefully chosen material of higher weight efficiency, and a ventilated structure; moreover, owing to its ventilated design the new motor will have a sustained capacity not less than 50 per cent. in excess of that of the older type of machine.

A closer investigation of the curves in fig. 1 will show the desirability, from the weight-efficiency point of view, of employing a few motors of high capacity, rather than a greater number of low capacity. The total cost is also much less in this case.

The best practice is to employ the largest motors which can be economically loaded on the lightest service. Rheostats, contactors, reversers, and train cables require to be duplicated for every additional pair of motors; the disparity in costs of the complete equipments is therefore far greater.

The limitations of linear dimensions are of even more strict a nature than those governing the weight. On the standard rail-gauge of 4 ft. 8½ in. the maximum distance between the inside of the wheel flanges is 52 in., which positively limits the length of the motor casing. In the other direction the wheel diameter is the limiting feature; the size in use on the majority of electric suburban, elevated, and subway railways is 33 in. Recently there has been a more liberal tendency in this direction, and wheels of 36 in. to 42 in. will become standard except where tunnel limitations are too severe. With the 33-in. wheel the maximum armature diameter is 20 in., and the maximum practical length of core for a 600-volt motor of about 200-kw. rated capacity is about 15 in.

In fig. 3 curve A represents a series of interpole designs worked out by the author, whilst the points indicated refer to machines in actual service. The step at the end of the curve relates to motors with duplex gears. It is interesting to compare the curve relating to railway motors with that plotted for stationary machines; the great disparity is due mainly to the system of rating employed.

Railway motors, being invariably series wound, attain high rotational speeds at light loads; the free-running speed in service usually coincides with about one-third the rated load, and is nearly double the rated speed. 600 A.P.M. is a good average value for satisfactory designs.

In general the efficiency of the high-speed motor is better at rated load and inferior at light loads as compared with the lower-speed design.

Practically all motors of 100 kw. and over are designed for one armature turn per segment in order to reduce the reactance per coil, but even with the most careful design the reactance voltage at rated load is of the order of 9 or 10, or four times that of a reasonably good generator.

A device which has found universal adoption is the grooving out of the commutator mica to a depth of about 1/16 in. below the surface of the copper. This avoids any trouble due to high mica and has a remarkable effect in keeping the commutator surface clean and cool. With the hard carbons in common use centrifugal force is found quite sufficient to keep the slots free from particles.

Commutating-pole motors are now being regularly supplied with 2,400-volt insulation and 1,200-volt commutators for running two in series on a 2,400-volt line. The broad advantage obtained by the use of interpoles is the greatly reduced chance of flash-overs. The reactance voltage being practically neutralised, and the sparking proportionately lessened in severity, there remains little to start an arc from brush to brush or to frame. The commutating-pole machine therefore becomes a stronger type of motor, capable of heavier short-time overloads and higher speed and voltage, whilst its maintenance charges are greatly reduced.

It is found that the traction motor is no larger and, as already seen, is lighter than the pre-interpole machine. On the Moselhütte mineral line in Lorraine, the locomotives are operated at 2,000 volts, the pressure on each motor being 1,000 volts. The gauge of the line is only 39½ in., notwithstanding which it has been found possible to equip the locomotives with motors rated at 120 kw., the armatures being of 26 in. diameter with a core length of only 6½ in.

It is frequently the case that a certain type of motor will be called upon to perform widely different classes of service, possibly interchanging local service with as many as two stops per mile with express schedules running five miles or more without a stop. The use of sectional or tapped field control affords one method of effecting the compromise and operating a system of diverse characteristics with one type of motor. More valuable still is the use of field control for nothing up on the controller during acceleration. A motor designed for this principle will probably have at its full field a speed 10 per cent. lower than the average machine, whilst with the short field this speed is increased by some 25 per cent. The motor is thus able to run upon either of two speed curves at the will of the motorman.

The commutating characteristics are so improved in the interpole machine that reduction of the main field by 50 per cent. does not appear to affect the collection of current. Typical speed curves for a field-control motor are shown in fig. 4.

Speeds of 450 R.P.M. for the rated load speed at full field, and 550 or 600 at short field, are typical of what has been found most satisfactory practice for a 200-kw. motor. Too great a disparity in the speeds at any given armature current leads to a pronounced current "kick" when changing, and would probably tend to induce flashing over.

The field-control motor provides a shorter rheostatic period and a much longer period of motor speed-curve running. The lower the full-field speed of the motor the quicker will the rheostats be cut out, and the less the rheostatic losses for a given acceleration rate. On one of the suburban railways in Christiania, Norway, the field windings of the 1,200-volt motors are not only divided for short and full fields, but are grouped for series and parallel connections. This gives four different running speeds all with the motors directly on the line. By this means nearly half of the controller notching may be performed free of rheostats, and a good approximation to alternating-current tapped-transformer control is effected. The mere tapping-off from a single point near the middle of the field winding is becoming standard practice, however, in view of the simplicity of the necessary controller connections.

The overall efficiency of a motor allows for losses in the copper, core, and commutator, together with gear and bearing friction and windage. As factors in the temperature rise, all

The basis of both the American and European methods of rating railway motors is the 75 deg. C. temperature rise in a 1-hour run on the test bed with covers removed and no artificial ventilation. Without having been standardised in England, this system is in very general use here and might quite well be officially adopted. It is usually recognised that the 1-hour rating represents the maximum desirable current input for acceleration, and that the average load for a complete day's running should not exceed 30 per cent. rated load for

FIG. 1.—WEIGHTS OF CONTINUOUS-CURRENT RAILWAY MOTORS AT 600 R.P.M. RATED SPEED.

FIG. 2.—UNIT WEIGHTS OF RAILWAY MOTORS CORRESPONDING TO FIG. 1.

but the gear losses are effective. In the short 1-hour heat run these are absorbed in the mass of the machine, there being little radiation with heavy motors. The output of a railway motor at rated load is, however, being superseded as a criterion of its service capacity. What is far more important than the 1-hour rating is the capacity for continuous operation of five or six hours or even longer periods.

From the curves in fig. 5 it will be seen that although two different machines may have exactly the same rated 1-hour output, efficiency, and possibly weight, their performance on runs of longer period is radically different. Motor A will take much heavier loads to reach its 75 deg. C. rise than motor B, two, three, or four hours' running. The former is representative of the recent ventilated designs, and the latter of the totally enclosed carcass motors which are only

unventilated, or 50 per cent. rated load for ventilated, machines.

In more than one instance on electric railway systems in America ventilated motors rated at 50 kw. are doing the same work as the 80-kw. non-ventilated machines which they have superseded, with a net saving of 50 per cent. on the equipment weight and of 30 per cent. on its cost. Ventilating motors have been found to operate satisfactorily even under the most adverse circumstances of dusty and gritty ballast.

In recent designs radial ducts in the core have been quite abandoned in favour of longitudinal passages. Recently, multiple fans have been introduced by which the air is all

FIG. 4.—SPEED AND TRACTIVE-EFFORT CHARACTERISTIC FOR A 45-KW. MOTOR ON SHORT (S F) AND FULL (F F) FIELDS.

just being superseded by type A. The heating in actual service may be assumed to be some 15 per cent. lower on account of the positive draught produced by the motion of the train.

In fig. 6 are shown the approximate values of the losses in a 180-kw. railway motor, and fig. 7 shows the thermal characteristic of the same machine running on stand test. The preponderating factor in the temperature rise at rated load is the copper loss, and at light loads the core and stray losses; consequently a motor for frequent stops and accelerating service should be designed with a view to the lowest possible copper loss, whilst the machine which is expected to run for one or more hours continuously at about one-third rated load should have the lowest possible core loss in order to operate within its temperature limitations.

It is impossible to specify for a railway motor on the basis of its 1-hour rating alone. Specifications should call for the value of the various losses at two or three different loads, particularly for the average load at which the motor is expected to operate in service.

FIG. 5.—TIME TAKEN TO ATTAIN 75 DEG. C. TEMPERATURE RISE ON HOTTEST ACCESSIBLE PART.

(A) Ventilated; (B) Non-ventilated motors.

FIG. 6.—LOSSES IN A 180-KW. MOTOR.

drawn in at one end of the carcass through all the passages in parallel and expelled at the other end.

The air circulation is effected by an exhaust fan of very compact type, usually of aluminium or pressed steel, which is bolted to the armature core and actually forms the end core-plate. The velocity imparted to the air is sufficient to retain in suspension any dust which might enter the casing and to carry it out again. The drawback to the earlier semi-ventilated motor was that no positive velocity was given to the air, and also that the structure of the machines provided dead-ends and pockets into which the dust, grit, iron oxide, and other particles were driven and permitted to accumulate. The present type of motor with its strong induced draught

and clean-cut and direct air passages overcomes these drawbacks entirely.

Forced ventilation by means of air compressors does not seem to be justified except where it is required to force the output of a motor beyond that obtained by internal ventilation. The device is at present almost wholly confined to locomotives.

The increase in rated voltage to values higher than 600 followed immediately upon the introduction of commutating poles into railway-motor design; commutation was thereby so much improved that an increase of 100 per cent. in the average volts per commutator segment was found permissible.

FIG. 7.—THERMAL CHARACTERISTIC OF 180-KW. MOTOR (see fig. 6) FOR 75 DEG. C. TEMPERATURE RISE.

The practicability of pressures of 1,200 or 2,400 volts has greatly broadened the limits of continuous-current working. Where these high pressures are employed it is generally for fairly heavy service of the interurban or extra-suburban order demanding powerful motors; this is a favourable feature, as in common with other classes of electrical machine the high-voltage traction motor becomes a more economical proposition with increasing outputs. There is a perfectly definite limit to the pressure which can be applied to the motor terminals, and this would appear to be about 2,000 volts for car motors of the type under review.

FIG. 8.—SECTION OF 200-KW. 1,200-VOLT VENTILATED MOTOR FOR FIELD CONTROL.

With increased voltage the current to be commutated is reduced, consequently the commutator can be shortened in almost the same proportion. Every inch by which the commutator is reduced may be added to the core length, thus immediately securing an increase in the effective flux passing through the armature. This very nearly compensates for the reduced armature loading consequent upon the low space factor in the slots, and leads to the conclusion that with given dimensions the higher-voltage motor needs to be designed for a stronger field and weaker armature. This is just the tendency required for a satisfactory design.

The two limits governing commutator design in high-pressure motors are the maximum permissible voltage per segment and the minimum segment width. The minimum allowable width of bar including mica is about 0.16 in., the limiting desirable average voltage per segment is believed to be 20 for a reasonably good field distribution.

If these conditions are complied with, the design and manufacture of a satisfactory 1,200-volt motor is a simple matter, and that of an 1,800-volt machine, whilst being a slightly more heavy and costly proposition, is very little more so. Higher pressures than this do not seem necessary in view of the practicability of connecting groups of two or four motors permanently in series.

The same motor carcass which will give 200 kw. at 600 volts will yield 180 kw. at three times this potential. Fig. 8 shows a longitudinal section of the 1,200-volt motor.

CHATTERING WHEEL SLIP IN ELECTRIC MOTIVE POWER.

A PAPER on this subject was read at the Midwinter Convention of the AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS, New York, by Mr. G. M. EATON, of which the following is an abstract:—

The fundamental difference between the running gear of steam and electric motive power is that in the steam locomotive, the only moving parts having relatively high moment of inertia are the driving wheels.

In an electric locomotive, the moment of inertia of the rotors, especially when operating through a gear reduction, may be as great as or greater than that of the driving wheels.

The combined inertia of connecting rods, cross-heads, piston rods and pistons is practically negligible in so far as it affects acceleration of driving wheels after slipping starts. In an electric locomotive, when slipping occurs, the sequence of events is as follows, regardless of the type of drive:—

Current is applied to the motor and the rotor starts to turn. Clearances in the entire transmission mechanism are first eliminated. Then, as the torque is increased, the metal of the transmission, framing, &c., is bent and twisted, or otherwise deflected. This stressed metal becomes a storage battery of energy. Finally the tractive effort reaches a value sufficient to overcome the existing adhesion at the rail (coefficient of friction of repose), and the wheel starts to slip. The instant relative movement occurs between wheel and rail, the coefficient of friction drops from that of repose to that of relative motion. There is, therefore, an opportunity for the stressed metal to start discharging its stored energy, since part of the resisting force has disappeared. This energy is expended in

FIG. 1.

accelerating the wheels ahead of the angular position they occupied relative to the rotor at the instant slipping started.

It is necessary next to analyse independently the two divisions of the rotating system, namely, rotors and wheels.

Since the wheels are being accelerated ahead of the rotors, the rotors are losing their lead and will tend to speed up. This is true not only of motors of series characteristic, but also of induction motors when running below synchronism, as will ordinarily be the case in traction work when the wheels slip. In fact, the induction motors, because their generated counter E.M.F. with increased speed is less than with series motors, will hold up their torque better and, therefore, accelerate faster.

Analysing next the other division of the system, the adhesion at the rail will decrease as the velocity of the wheel tread relative to the rail increases. The effort being transmitted through the transmission system, however, will decrease very rapidly, due to expenditure of stored energy, and as soon as this effort, which is tending to accelerate the wheels, becomes less than the adhesion at the rail, which is tending to retard the wheels, the wheels will evidently start to slow down.

There are, then, two sets of rotating masses mechanically coupled, the masses at one end of the system accelerating, and those at the other end retarding. As soon as clearances in the transmission are taken up, there is liable to be a jolt on the mechanical system, accompanied by a recoil. This gives the setting for chattering action, and such action has been experienced in practically every type of electrically-driven rolling stock where the motors are sufficiently powerful to slip the wheels at high adhesion.

In the case of a geared freight and passenger locomotive, the quill arms at the point marked A hit against the wheel spokes at the point marked B (fig. 1), and more or less break-

age of these arms occurred, but this was traced to defective castings.

In later locomotives in the same service equipped with two motors per axle, the change in armature inertia eliminated this striking.

The same characteristic is occasionally observed in city and interurban cars, although this is much less frequent than in heavy hauling electric locomotives.

In the case of freight locomotives where the motors are geared directly to the axles the same phenomenon has been observed.

On the Norfolk and Western locomotives, chattering slip occurred in the running gear shown in fig. 2. After the locomotives had been in service for some months, evidences of failure were detected in the crank pins. The cause was traced to chattering slip by means of a rough oscillograph. The brakes were set on three trucks, and the oscillograph frame

FIG. 2.

was set up on the fourth truck. The characteristic diagram of the chattering slip was obtained, as shown in fig. 3. The analysis in the figure is self-explanatory.

To check the oscillograph figures, extensometers were arranged, as shown in fig. 4, by means of which the connect-

FIG. 3.—OSCILLOGRAPH RECORD SHOWING MOTION OF WHEEL DURING CHATTERING SLIP.

ing rods indicated their own stresses. The extension and compression of the rods were recorded by means of the compression of blocks of lead.

The two methods checked within a very few per cent. On the basis of the results, new rods, pins, &c., were applied on the locomotives. These have proved adequate for the service.

This chattering slip was more evident on the Norfolk and

FIG. 4.—EXTENSOMETER TO INDICATE CONNECTING-ROD STRAINS.

Western locomotives than could have been anticipated, since this was the first time electric haulage had been applied in service where such extremely high tractive efforts were required.

In all heavy hauling electric motive power, this problem must be considered, with every type of drive. The great number of variables entering and the wide fluctuation of certain of these variables render broad experience necessary in securing a successful solution of the problem.

IMPORT TRADE OF CEYLON.

The following figures, showing the value of the imports of electrical and allied material into Ceylon during 1914, are extracted from the recently-issued official statistics. The values for the previous year are given for purposes of comparison, and notes added of any increases or decreases:—

	1913. Rupees.	1914. Rupees.	Inc. or dec. Rupees.
<i>Manufactures of copper.—</i>

(N.B.—15 Rupees = £1.)

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

SIERRA LEONE.—A Sierra Leone Ordinance has been passed imposing increased duties on certain articles imported into the Colony, with effect from January 1st, 1916. Electrical machinery and apparatus (and all parts and appliances thereof) consisting of a combination of moving parts or mechanical elements which may be put in motion by physical

or mechanical force, and admitted as such by the Collector of Customs, remain free of duty; the duty on all other electrical apparatus has, however, been increased from 12½ per cent. *ad valorem* to 15 per cent. *ad valorem*.

SWEDEN.—The exportation of the following, among other articles, has been prohibited from Sweden as from January 18th:—Asbestos, unworked; manufacture of asbestos, not specially mentioned; insulating compositions (for protection against heat or cold) with or without admixture; also manufacture of such insulating compositions, such as slabs, segments, and other shaped pieces.

FRENCH INDO-CHINA.—A concession which cannot fail to be of the greatest assistance to British traders who export goods to Indo-China has recently been announced. Hitherto, British goods, in order to obtain the benefit of the "Minimum" Tariff rates on importation into Indo-China, have had to conform to the condition that the goods be transported *direct* to that country. The official announcement, however, states that as an exceptional measure, and for the period of duration of the war, goods of British origin will be entitled to the "Minimum" rates *even if the goods are transhipped en route* at Singapore, subject to the production of certificates of origin as required by the regulations.

MOROCCO.—The Board of Trade have received a copy of a Tariff showing the valuations of the principal articles of merchandise imported into Morocco. These valuations form the basis on which duty is to be assessed by the Moorish Customs Administration during the first half of 1916. It should be remembered that, with certain exceptions, goods imported into Morocco by sea are subject to duty at the rate of 10 per cent. *ad valorem*, and also to the special tax of 2½ per cent. *ad valorem* imposed as a temporary measure by Article 66 of the Algeiras Act. The new valuation tariff may be inspected at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

UNITED STATES OF AMERICA.—The following decision respecting the application of the United States Tariff Act of 1913 has recently been rendered by the Board of General Appraisers:—

Metal Flash-light Cases.—The outer casings of electric flash-lights, composed wholly or in chief value of metal, lacking only batteries and light bulbs to render them complete articles, valued above 20 cents (10d.) per dozen pieces, are not like articles to those enumerated in paragraph 556 of the Tariff, and are, therefore, not within that paragraph. They are properly dutiable as manufactures of metal not plated with gold or silver, under paragraph 167 of the Tariff, at the rate of 20 per cent. *ad valorem*.

VENEZUELA.—In virtue of a Presidential Decree, dated December 17th, 1915, pocket and portable electric lamps when imported into Venezuela are to be declared in the Consular Invoice, and to pay duty, as follows:—

Declaration for Consular Invoice.	Class of the Tariff under which dutiable.	Total import duty (including surtaxes).
Lámparas eléctricas portátiles y de bolsillo	IV, plus 30 p.c. specific.	1.526 bolívars per kilogram (gross).

It is important to preserve the exact (Spanish) wording shown above in the "Declaration for Consular Invoice." (Bolívar = 9.6d.; kilogram = 2.2046 lb.)

GAMBIA.—A new Customs Ordinance (No. 21 of 1915) came into force on January 1st, 1916, in the colony of the Gambia, which makes provision for the levying of import duties differing in many instances from those formerly in operation. Among the articles *exempted* from import duty may be mentioned electrical plant and apparatus, and industrial and manufacturing machinery for use in connection with the preparation of any natural product of West Africa, and spare parts imported at the same time; scientific and surgical instruments and apparatus; telegraph materials imported for the use of the African Direct Telegraph Co. The duty on all goods not specified and not exempted from duty has been increased from 5 per cent. to 7 per cent. *ad valorem*.

In spite of the prevalence of war conditions, the Institution of Electrical Engineers has found time to carry out a revision of its wiring rules, and issued the 7th edition last week. The Wiring Rules Committee is a Standing Committee of 20 members, on which all the interests involved are represented, including the fire insurance companies, and we are glad to be able to state that *all* the latter have now adopted the rules; these are also accepted as standard practice by most of our electricity supply authorities, so we may congratulate the Institution and the industry on the excellent progress that has been made towards the universal acceptance of a single standard code, in place of the heterogeneous and chaotic mass of local regulations with which the contractor was confronted some ten or twelve years ago. The rules have been extended to include medium pressures (up to 650 volts)—a very necessary step in view of the amount of power that is supplied from the outers of three-wire systems and on three-phase networks at pressures between 400 and 500 volts—and it is interesting to note that provision has been made for the use of conductors with "tough rubber compound protection," under which disguise may be detected cab-tire sheathing. A table showing the capacity of conduits forms a very welcome addition, and an attempt is made to secure uniformity in the use of colours for distinguishing the conductors. Where possible, too, the work of the Engineering Standards Committee has been utilised.

The wording of the rules has evidently been very carefully revised, with great advantage in precision and lucidity, and numerous minor changes have been effected. One very commendable change is the abandonment of the definition of grade of insulated cable in terms of its insulation resistance—a misleading system, which was also to a great extent meaningless, owing to the wide range of values of the megohms per mile between the large and small sizes of cable. In place of this, v.r. cables are now to be graded as "I.E.E. 250-volt cable," and "I.E.E. 650-volt cable," a much more reasonable system.

Many changes have been introduced into the definitions and rules regarding conductors, etc., in the direction of greater safety and reliability; thus the size of insulated wire above which stranded conductors must be employed is reduced from No. 14 to No. 16 s.w.g., and in the case of flexible conductors No. 36 s.w.g. is made the minimum instead of the maximum size for each wire; for medium pressures heavy-gauge screwed conduit is specified;

switches having a handle projecting through an open slot in the cover are forbidden; the use of "hard metal" for fuses is no longer recommended, nor is it suggested that soft metal fuses should be soldered to metal plates; the "Home Office" pattern of wall plug is recommended, and the use of a cord grip for flexibles connected with wall plugs is specified, while it is advised also on portable appliances in no fewer than three identical clauses on three consecutive pages; and heaters consuming over 1,000 watts—as will the majority in future—must be fitted with double-pole switches.

The printing of the wire table in the rules instead of on a separate sheet is a distinct improvement; the only other change in it appears to be the elimination of the superfluous figures in the column giving the resistances of conductors per 1,000 yards, which were formerly carried to four significant figures—a useless refinement, seeing that a variation of 2 per cent. is allowed; in most cases two digits, and in the remainder three, are now employed, and are sufficient for all practical purposes.

On the whole, while the rules are not yet beyond criticism, we must congratulate the Wiring Rules Committee upon the results of its last revision; the wording, the composition, and the arrangement of the rules have been very greatly improved, and the changes that have been introduced in the regulations are such as will, we believe, command general approval.

"To Be Wound Up."

To all who desire to see success attend the British fight against German trade, the *London Gazette* has been of abundant interest during the last few months. Several issues have contained lists of companies, firms, and individuals with whom it is permissible to trade in China, where German scheming during the war has been extremely active. The reader naturally draws his own conclusions as to what his connections should be with those whose names do not so appear. In another issue, as we recently stated, there appeared lists of persons and bodies of enemy nationality or associations in Greece, Morocco, Netherlands, Norway, Portugal, Portuguese East Africa, Spain, and Sweden, with whom or which trading is prohibited. In these lists a number of electrical names are condemned. But last of all we have a number of issues of the *Gazette*, publishing the names of businesses in this country which, under the Trading with the Enemy Amendment Act, have been ordered by the Board of Trade to be wound up. Here, again, a number of electrical and allied names are recorded. We have quoted such of the 44 companies as appear to interest our readers, in our "War Items," but the announcement which will be welcomed most of all by the electrical trade is that which concerns the Electrical Co., Ltd. So long as the law permitted a business in which practically the whole of the capital was German owned, and the main purpose of which was to represent the Allgemeine Elektrizitäts Gesellschaft, to continue trading, the matter was one of extreme difficulty, but it was, nevertheless, a blot on our escutcheon. We have watched the A.E.G. activities in this country, so far as it was possible to keep track of its operations, for many years. Its representatives came over here at a time when they were not viewed either with suspicion or with serious misgiving, and they laboriously and enterprisingly built up an

organisation at great cost, which resulted in millions of pounds' worth of contracts being sent out of the country. Our industry was not in a state to resist the competition. The A.E.G. agents went in and out amongst us as respected gentlemen, notwithstanding all that we say to-day about the Teuton of these days not having the word "gentleman" in his vocabulary. They were, or seemed to be, Germans of the "old school"—if we may use the expression. We hope that, when the anti-German sentiment is so strong within us all, we shall not be misunderstood for stating these facts, for among other things that this disappearance of a company from our registers suggests to us, is the illustration that it affords within our own industry of the gross stupidity and shortsightedness of the Prussian scheme for world domination. There will not be a British electrical man who will regret the passing into oblivion of a concern which stood for the letters A.E.G. in England while that vast German organisation was engaged in manufacturing war supplies of so many kinds for the enemy. The senseless mutterings of its head, Dr. Walther Rathenau, recorded in our pages, about war being waged in the old Roman way, and the desires held in that quarter for making war on the British Empire, have not been without their effect upon the British electrical mind. They will not soon be forgotten after the war. Much blood has flowed on the Continent, and a record of infamy and shame has been written which has shocked the world. The Colonies are as determined as we are that neither this nor any other German organisation shall have things so much its own way in our markets in future as it has had in the past. The announcement now made gives final dismissal to A.E.G. activity in this country so far as it was represented by the Electrical Co. Parts of its organisation may have passed into other hands, and some of its staff and employees may be employed by indisputably British and neutral concerns, but the Electrical Co., Ltd., as such, in its capacity for earning profits whether on the sale of British or other goods, for German capital, is ended. The company's doings formed the subject of a good deal of correspondence in these pages a short time ago, and those who took part therein will not be disappointed at the course that events have taken. Further, those who were legally bound under contracts to supply goods to them will, doubtless, feel relieved that by the process of forced liquidation they are freed from their contractual responsibilities. The question that will naturally occur to many minds will be: Will the A.E.G., after the war, be permitted to "raise its head" again in the British Isles or in the Colonies? We wonder!

British Finance for Italian Trade.

BRITISH observers in Italy have been very definite in their warnings to British manufacturers that unless they take swift advantage of the opportunity, it will slip through their fingers. Italian buyers who long for freedom from Teutonic economic influence, and are determined that, if they have it in their power to decide, German penetration in Italian commercial and industrial affairs shall never again be what it was before the war, have shown signs of impatience with us because we have talked so much of bold intentions, but have seemed to delay the taking of appropriate action. But all movements are not shown upon the surface, and plans are often maturing for many months before the outside world knows anything about them. We believe that it will gratify our Italian brothers-in-arms as much as it will please the British commercial and industrial world, to learn that two of the best English banks—(the London County and Westminster, and Lloyd's)—as representatives of what is described as a "financial group," have entered into an agreement for the formation of an Anglo-Italian Bank for the purpose of developing the economic relations between the two countries and promoting commercial and industrial undertakings in Italy. The new concern will be made up of two companies—the British Italian Corporation in this country, and the Compagnia Italo-Britannica in Italy; the former will have a capital of

£1,000,000 and the latter £400,000. The financial group which is acting in the matter is very strongly backed. This move on the part of our financial leaders should give great encouragement to all who are desirous of assisting as traders in the fostering of commercial relations. And more than that, it augurs well for the strengthening of British financial facilities, and a more general co-operation with industry, in other countries where enlightened finance is unquestionably going to be one of the most important factors assisting us to be even with Teutonic competitors when the world is open to them again.

Lead.

THE position of pig-lead has again been the subject of considerable interest lately.

The price of this metal has kept at a very high level for some considerable time past, and most consumers were rather inclined to believe that this was partly the result of aggressive speculative buying. Recent developments, however, have certainly tended to dissipate that impression. With the intervention of the Government in placing lead, like most other metals, under the Defence of the Realm Act, thus eliminating all speculative transactions, business was naturally brought for a time to a complete standstill until the metal market was reopened under the new regulation. The market was then put to a test, and in a temporary absence of inquiries the price was depressed to the extent of 25s. a ton to about £31 15s., but there were not many sellers near that level, and the law of supply and demand reasserted itself to an extent which has soon resulted in the price being restored to the level at which it stood prior to the Proclamation. The strong underlying conditions having thus been more readily recognised, the ease with which the recent fairly large supplies were taken care of has tended to stimulate the covering of prospective needs over the spring. The market was in rather an excited condition in the course of the past week, with successive jumps in the price to about £34 a ton for next month shipment, the highest figure recorded since the years which followed the Napoleonic wars, and there was a further rise early this week. The price is admittedly extravagantly high, but it is well to bear in mind that the enormous war requirements now absolutely dominate the position. Never before in the history of the trade has there been so much lead wanted as at the present time, in spite of the comparatively reduced industrial requirements on this side. The present lofty level of values certainly affords every inducement for producers to push mining operations, but there is, of course, a limit to the forcing of the output, while, at the same time, efforts in that direction are liable to be frustrated by labour troubles as happened in the early part of this year in Australia. Operations in that quarter are now again running pretty smoothly, but labour tribulations have lately occurred in one of the chief mining districts in Spain, and this has not been without effect upon the temper of the market, though the latest news regarding the Spanish strike is a little more hopeful. In the course of the past year, the unusually large American surplus diverted to this country, following upon the huge increase in the American output in 1914, had the effect of keeping prices down for a time, but the American position is now much stronger. Domestic consumption has been considerably on the increase, so that the exportable surplus has been correspondingly reduced. The British market is thus more dependent upon the shipments from Spain and Australia in order to keep pace with the huge requirements largely in connection with munition work. Our imports for the first two months of this year were over 7,000 tons short of the same period last year, this deficit representing the shortcomings from America and Spain. The fact has to be remarked that the total Spanish exports for the past year show only an increase of about 9,000 metric tons against the previous year's returns. The position of lead has undoubtedly been complicated by shipping difficulties and labour scarcity in this country which tend to handicap smelters' operations, and Government action in that direction would possibly assist in affording some relief from the present stringent conditions.

THE ENGINEER IN THE TROPICS.

By GEO. R. ARCHDEACON, A.M.I.E.E.

It not infrequently happens that "in search of that bubble reputation" the electrical engineer penetrates the deadly swamps and forests of Africa, India, South America, or the Malay Straits. Before finally deciding upon the acceptance of an appointment in any tropical district the young engineer (who has been hitherto full of the wild desire to get out of England), when faced with the grave decision of accepting or refusing what at first sight seems a very tempting offer, will probably be troubled by such matters as (a) The high death rate obtaining in that particular district; (b) The outfit necessary; (c) The cost of living; (d) Social life.

The author has frequently been faced with these posers, and oftentimes has found his geography too weak to enable him even to locate the place offhand. To the untravelled engineer the tropics are wrapped in an atmosphere of mystery and death, and all his future success therein seems to hang upon the odds whether he will manage to live three years, or die within three months. The prospects of success and affluence are alluring, yet provokingly indefinite.

Upon one occasion, when a lucrative position in South America was offered to the writer, the managing director said, "If you stay in England you will have a fair amount of comfort and bread and butter; if you come with me you will have plenty of discomforts, but you will have jam upon your bread."

Let the young engineer bear this well in mind; in the Tropics he will not only have "jam on his bread," but he will live a freer life, and find unbounded opportunities for experience and progress. He will occupy a higher social position than a similar berth would carry at home, and the opportunities for saving are considerably greater than at home; but there are many pitfalls for the unwary. To save a reasonable percentage of one's salary necessitates a very strong will, and the exercise of that will must never be relaxed, for nowhere in Europe are the temptations so manifold as in the Tropics, coupled to which is the effect of a bad climate, which is constantly working upon one's health, and so reducing the vitality that gradually one's power of resistance decreases.

The question of total abstinence, or moderate indulgence in alcoholic drinks, in the Tropics, is perhaps one of the most vexed questions of the day. Each side has its strong adherents; each side possesses its convincing and conclusive statistics. The author does not pose as an authority on this subject, but, from personal observation and experience in various tropical districts, he advises total abstinence from all alcoholic liquors between sunrise and sunset; after sunset a moderate indulgence usually does no harm, but seems to act as a necessary stimulant.

The care of one's health in any tropical country must at all times occupy a serious portion of one's thoughts. Constipation at all times has evil effects, but in a tropical country its effect is simply deadly. Try and imagine the effect of the climate upon the average young Britisher who has all his life been used to cold fresh breezes, when he is suddenly dumped down, say, in the malarious and malodorous district of the river Amazon, where the temperature in his bedroom throughout the night is about 90° F., while the hydrometer shows about 85 per cent. to 95 per cent. humidity. One can well understand that living under those conditions one loses all desire for movement or exercise, and only cares to lounge about in pyjamas, with a long iced drink at hand. Exercise must be the watchword, and plenty of it, yet that is just the thing that one does not feel inclined to indulge in. This, again, is the occasion when the strong will must be exercised.

Another vexed question is quinine. Should one fortify oneself against malaria by taking, say, five grains per day, or not? If one takes quinine each day, trouble arises in the administering of it if one does (in spite of being charged with the drug) contract malaria. Here, again, we find the experts taking sides on this grave issue. Beyond doubt a daily consumption of quinine does appear to reduce the risks of malaria; therefore, on the principle of

"prevention is better than cure," the author is of the opinion (in spite of slight deafness frequently caused by the habit), that one should never neglect the daily dose of quinine when in a malarious district.

As regards the most suitable "first aid" remedies to carry, it depends largely upon what district is being considered—tropical diseases vary very much in the various districts; for example—

Yellow fever in Brazil, but never in India, Malay Straits or China.

Sleeping sickness and blackwater fever in West Africa, but never in Brazil, China, or India.

Malarial fever, however, is found in all tropical countries. Perhaps the most useful items to be observed are:—Vaccination against smallpox; inoculation against enteric fever; chlorodine for cholera and dysentery; quinine for malarial fever; corrosive sublimate for wounds and scratches; ice-cap in case of sunstroke.

Apart from the mosquitoes, chills are the most fruitful causes of illness, and they frequently lead to serious results. It is most important to avoid chills; many a man has gone to his grave through kicking off his sheet during the night and sleeping with the fan blowing a draught of cool air on to his body. A cholera belt should *always* be worn during the night.

The all-important question of clothes will, doubtless, require a considerable amount of thought. Again, local conditions must be inevitably the guide. Many districts have a fierce tropical summer, yet during the winter it is necessary to wrap up in thick furs and have a roaring fire in the bedroom. The style of one's clothes must be carefully considered. In India, Africa, and Malay Straits, white patrol jackets buttoned up to the chin are usually worn, whereas in Brazil, Hong-Kong, and Shanghai, white jackets cut in a similar style to our lounge jackets at home, showing white soft shirt, collar and tie, are considered the only possible wear for a gentleman.

To sum up the whole subject, life, to be fairly certain and healthy in the Tropics, should be (with a few reservations) maintained in a manner similar to that followed at home. The most important items to be observed are:—Plenty of exercise, plenty of sleep, plenty of good food, and plenty of optimism.

THE TESTING OF UNDERGROUND CABLES WITH CONTINUOUS CURRENT.

MR. O. L. RECORD's paper on this subject was read before the MANCHESTER LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS on February 8th. An abstract of the paper appeared in our issue of February 18th. In the discussion the Chairman (MR. B. WELBOURN) said that the present knowledge of insulating materials dictated that A.C. overhead lines could only be constructed for a maximum pressure of 150,000 volts, but the information given in the paper would suggest that D.C. pressures of even 300,000 volts would be practicable for overhead lines. It would be interesting to know the highest limit of D.C. pressure which could be used.

MR. C. J. BEAVER said the distribution of stress with continuous current was quite different to that with alternating current; it depended upon different factors, viz.: resistance in the former case and capacity in the latter, therefore the effects would be quite different. The object of testing cables after laying was mainly to ensure that any damage incurred in laying was rectified. He did not entirely agree that there was no relation between the dielectric strength and the insulation resistance. The only advantage in size and weight of the Delon transformer lay in the fact that it had only to be designed for a small current. Sound dielectrics were not affected by pressures several times the working pressure, and the factors of safety employed ensured that the dielectrics were far removed from any such effects. Dielectric fatigue was simply the reaching of the limit of disruptive voltage of some component of the dielectric. The fatigue stage would, therefore, be far removed from any effect which could be brought about by such voltages as were likely to be applied to the cable under working conditions. A manufacturer might show some disinclination to take the responsibility for a cable suffering from things over which he had no control, but otherwise it would not interest him very much if the cable were tested repeatedly at twice working pressure. The most important question in connection with the D.C. apparatus was whether it would satisfactorily burn out faults. Wet cables were extremely difficult to break down, and the more water-logged the cable the more difficult the task.

Prof. E. W. MARCHANT said the relationship existing between the breakdown strength of material tested by direct current and alternating current was one of the most remarkable phenomena met with in electrical work. A cable having a non-uniform dielectric would have an entirely different distribution of stress in the two cases, the D.C. case depending upon the specific resistance of the material, and the A.C. case depending upon the specific inductive capacity. This was one of the reasons why the direct-current method of testing could not be regarded as entirely satisfactory. A number of tests had been made at Liverpool on the dielectric strength of ebonite, with the object of determining the amount of fatigue, which in ebonite appeared to be extremely small. He had tried to find what might be styled "mechanical fatigue," but the tests had failed to reveal it. He described a Wimshurst machine designed by Mr. Watson for direct-current testing, and giving an output of 4 or 5 milliamperes at 150,000 volts. Mr. Watson had also designed a special voltmeter reading up to 100,000 volts. The instrument was of the reflecting type, and was only a foot in diameter, the moving parts being arranged in a chamber filled with compressed air at 200 lb. per square inch pressure.

MR. H. A. RADCLIFF thought the continuous-current test did not meet the requirements of a test under working conditions on alternating-current cables. The application of an excess alternating pressure was undoubtedly the correct method of testing A.C. high-tension cables before being put into service, and where possible it was advisable, before applying the excess pressure, to warm up the cables for several hours by circulating through them the maximum load current. This could easily be done using a suitable low-voltage transformer. Any test which ignored the effect of dielectric losses was necessarily incomplete. He agreed that there was no definite relationship between dielectric strength and insulation resistance. Insulation resistance or excess pressure tests were in themselves insufficient, and in future all tests of any value would include accurate measurements of the dielectric losses. In the case of sample lengths tested at the manufacturers' works, the pressure should be applied for several hours, and, if possible, a superposed low-voltage current equal to the maximum load should be passed through the conductors, all tests being made at normal working frequency. Whilst a high insulation resistance was not necessarily an attribute of a good high-tension cable, it greatly facilitated the location of leaky joints and fittings. The difficulties of testing with alternating pressure seemed rather magnified, as 12 miles of cable would never be tested at 40,000 volts with portable equipment. Tests after laying were usually made in lengths of about a mile, and after locating defects and making the joints, excess pressure was applied to the full length from the generating station or sub-station. Such a final test was required by the Board of Trade, and despite the energetic opposition of the cable makers it was likely to be repeated. He could not understand how a continuous pressure could ever be regarded as the equivalent of an alternating one.

MR. F. FERNIE considered that the curve showing the relation between breakdown voltage (A.C.) and duration of test was not always true. A certain paper-insulated cable broke down under test at 91.5 kv., but when 90 kv. was applied to another portion of the same cable for some hours there was no breakdown. The pressure was again applied and raised steadily until 91.5 kv. was recorded, and the cable again broke down. Other cables tested at the same time gave similar results. Similarly, the statement regarding the decrease of breakdown voltage with increase of frequency was not true for frequencies below 100; any decrease which did occur would certainly be under 5 per cent. Nearly all statements regarding dielectrics were to be accepted as true for a specimen rather than a substance.

MR. H. M. CRELLIN said that experiments had shown that heating a cable to the temperature of boiling water did not perceptibly reduce the breakdown voltage. In the case of a cable damaged in laying, assuming the dielectric to be partially cracked so that it was composed partly of air and partly impregnated paper, with D.C. pressure the drop across the dielectric would be directly proportional to the resistance of the layers. It might easily happen with continuous pressure that the potential gradient would so adjust itself across the dielectric that the presence of a crack would remain undetected. On the other hand, with alternating pressure the voltage drop across the dielectric would be fixed by the capacities of the layers, and not the leakage current. Impregnated paper had a dielectric constant approximately three times that of air; consequently, as the potential gradient was inversely proportional to the capacity, the alternating pressure would easily spark across the crack, and so break down the fault. Regarding the ratio of D.C. to A.C. pressures referred to in the paper, it was not generally realised that the ratio of secondary to primary pressure of a transformer was considerably increased by the charging current of a cable due to the effect of the leading current on the magnetic leakage of the transformer.

MR. J. L. LANGTON said the Delon apparatus would have a good application to the testing of line insulators *in situ*. His experience during the past year had shown that cracks due to temperature variations, expansion of cement, &c., were really the cause of the so-called fatigue in porcelain. Defects in insulators, which would break down with the usual transformer test, would not be disclosed by the Delon apparatus.

The smallest crack required alternate stress and heating in order to develop into a distinct fault. In air and in a solid insulation of mineral origin there was no relation between insulation resistance and dielectric strength. In the case of a solid insulation of vegetable origin, however, there seemed to be some relation, as moisture was a predominant factor when present in fibrous material. An increase in temperature would drive out moisture and increase the insulation resistance, but diminish the dielectric strength. Regarding the effect of frequency on dielectric strength, his experience with solids of mineral origin showed no difference between 33 and 100 cycles.

Mr. H. Alcock referred to the statement that the tests in question were only intended to show up faults produced in laying cables. The provision of a metallic test sheath interposed between the conductor and the lead sheathing already achieved this object, and further refinements seemed quite unnecessary.

Mr. J. W. RECORD thought the word "rectified" should be substituted for "continuous" in the title of the paper. The use of the cables instead of small condensers might easily involve a transformer of 300-k.v.a. capacity, such as was required in testing with alternating current. If such a test as was described should appear advantageous in future, it could only be put into operation after some competent authority had established the relationship between d.c. and a.c. pressures. The author's figures might certainly be laid down provisionally.

The AUTHOR, in a brief reply, said that in the case of cables for voltages at present in vogue, the margin of safety was so great that the question of fatigue was negligible. He cited a case where a 10,000-volt cable was subjected to 80,000 volts, after which the engineer had no qualms of conscience in testing at 20,000 volts, i.e., double working pressure, every time there was trouble with the joints. With 50,000 or 60,000 volts the margin of safety was much smaller, and special precautions had to be taken. He did not advocate replacing the a.c. test altogether by the d.c. test. The capacity of the transformer was 3 k.w., and this was actually effective power in the case of the d.c. test. Considering the extremely low power factor in the case of the a.c. test, it would be obvious that, in spite of the large capacity of the testing transformer, the effective power would be very small.

REVIEWS.

The Principles of Dynamo-Electric Machinery. By B. F. BAILEY. London: Hill Publishing Co. Price 12s. 6d. net.

Much may be said in favour of the principle that professors and lecturers should expand their lecture notes into a text-book for the use of their students. When the lectures and text-books are co-ordinated in this way, advantages of uniformity of method and terminology in the instruction are much facilitated. If the resulting text-book is of sufficient originality and merit, it may prove valuable to a larger class than the one which is more immediately addressed by its author, and its wider publication is fully justified.

We take the work before us to be of the type which represents in somewhat expanded form a course of lectures on elementary electrical engineering addressed to a class of the author's students. Judged from this standpoint, the book is well written, and will doubtless serve a useful purpose. When regarded from the wider aspect of the more general public, it is more difficult to foresee a sphere of usefulness.

While it may be regarded as a well-written text-book for elementary students, there seems to be no marked characteristic or originality in treatment which is likely to render it more helpful to the ordinary student than the several excellent text-books covering similar ground which have been published in this country at a fraction of the price of Prof. Bailey's book. In fact, the reviewer would not feel justified in advising any student to invest so large a sum as the price asked for this volume on a purely preparatory text-book, unless he is more than usually fastidious in the matters of binding and typography—both of which are excellent in the present case.

Turning to the contents of the book, the author believes that the material which it contains will satisfy the needs of students who do not intend to follow electrical engineering as a profession, while he also anticipates its utility as a first course for students who expect to proceed further in the subject. Sparing use has been made of mathematical demonstration, and the author has generally explained his subject by reference to physical principles and employed methods of general reasoning, rather than rigid proofs. In this manner he has covered the field represented by the most important types of electrical generators, motors, and transformers, and has succeeded in conveying an idea of the main principles underlying their behaviour and use. His diagrams are clear, and where illustrations of actual machines and instruments are introduced they are generally well chosen and helpful.

It is obvious that when such a large amount of material is dealt with in a book of 300 pages the treatment of many portions is necessarily very slight, and it would be unfair

to find fault with many omissions. It seems, however, a pity that no reference is made to magnetic leakage when dealing with field systems—especially as the student is asked to make calculations on the ampere-turns necessary to produce a given armature flux.

In view of the non-analytical treatment adopted in most parts of the book, it seems of doubtful utility to approach the principles of the alternating circuit in such an academic manner as is done in Chapter XII. Indeed, in this chapter the author seems to have departed somewhat widely from his plan of emphasising physical conceptions and avoiding such demonstrations as depend only on abstract mathematics and are wanting in appeal to the physical sense.

A good deal of the conventional mathematical treatment at this stage seems misplaced in a book intended mainly for the general and non-mathematical student, and such quantities as impedance and reactance need not have been introduced for the first time in the form of mathematical symbols and without any reference to their significance in practice. There seems to be no particular need to introduce the subject of electrostatic capacity and conditions for resonance at this stage, especially if the student is not distinctly warned against supposing that capacity and inductance are equally important factors in determining the impedance of the electrical circuits met with in the later chapters of the book.

Again, a certain number of rather advanced subjects are introduced, but treated in such general and superficial terms that the wisdom of referring to them at all seems open to question. One example of this is the single-phase induction motor, which is dealt with in three pages; even this short discussion seems to the reviewer to be lacking in clearness, which, it is only fair to add, is unusual in Prof. Bailey's book as a whole.

The reviewer's general impression is that for the non-electrical student the book may prove useful in conveying a general knowledge of the most important principles involved in electrical machinery; though, for the non-expert user of electrical machines, the treatment adopted is hardly the best. For the electrical student who hopes later to proceed further in his studies of electrical machinery, the book suffers from the fact that it deals too exclusively with principles and general statements, and provides an insufficient basis of concrete examples and definite results to enable the beginner to lay a good foundation for future studies.

The reviewer refuses to believe that it is wise to present the serious student with "the principles of dynamo-electric machinery" in a compass of 300 pages, especially when mathematical aids to abbreviation are little used.

Relativity and the Electron Theory. By E. CUNNINGHAM, M.A. London: Longmans, Green & Co. Price 4s. net.

This little work is one of the series of monographs on physics edited conjointly by Sir J. J. Thomson and Prof. F. Norton. As the author states, it is an attempt to set out as clearly and simply as possible the relation of the principle of relativity to the generally-accepted electron theory, showing at what points the former is the natural and necessary complement of the latter. Mathematical analysis has been omitted as far as possible with the object of rendering the account useful to the general reader, especially to the experimental physicist.

Of course, to the practical man the principle of relativity has very little bearing. He is apt to consider it and allied subjects as mere abstractions suitable as a study for those who have nothing better to do. Nevertheless, there are many desirous of keeping up-to-date with modern conceptions, and to such this little book of 90 odd pages can be commended.

The author, after discussing space and time in Newton's dynamics and the relativity of Newton's dynamics, goes on to show that time is not an absolute or independent concept. He then traces the advent of the ether theory and mentions Fresnel's convection-coefficient, and describes Fizeau's verification of Fresnel's hypothesis. The Michelson-Morley experiment is described and discussed at some length.

Towards the end of the work there is an interesting chapter on Minkowski's four-dimension vectors. Minkowski speaks of space by itself and time by itself as being mere shadows, and of only a kind of blend of the two as existing in its own right. He thinks of his four-vector as a single entity, just as we think of force as a single entity. The components of a force do not exist of themselves. They are only convenient means of specifying the force, which is one and definite. So space and time co-ordinates are to Minkowski only particular, complementary, and inseparable means of specifying a single fact or occurrence. Analytically, Minkowski transports himself to a space of four dimensions, in which the distinction between space and time vanishes. In this four-dimensional region the whole of space and time is portrayed in one construct.

The A.S.E.—The membership of the Amalgamated Society of Engineers has increased by 2,560 during the month of February to 208,825. This is a record for the society, which has secured about 30,000 new members since the war.—*Times*.

THE IMPORTS AND EXPORTS OF SWEDEN.

The following figures, showing the imports and exports in 1913 into and from Sweden of electrical and similar goods, are extracted from the official trade statistics which have just been issued. Unfortunately they are not as up-to-date as we should desire, the detailed 1914 figures not yet being available, but they are of interest as showing the course of Swedish business just before the war.

Insulating Tapes.—We have received from the Wholesale Electrical Co., Ltd., of 54-56, Oxford Street, W., samples of the insulating tapes made by the Canfield Rubber Co., for which they are sole agents in this country. The "Voltite" rubber jointing strip is stated to be superior to pure rubber for insulating joints and requires no rubber solution, the warmth of the hand sufficing to make a perfect union between the layers; it is a highly elastic material, and certainly appears to adhere to itself very tenaciously. Another sample of standard black adhesive tape has equally clinging propensities, and is closely woven and well coated with compound.

THE INSTITUTION OF ELECTRICAL ENGINEERS AND ALIEN ENEMY MEMBERS.

THE informal meeting of Corporate Members to discuss the question of expulsion of alien enemies from membership of the Institution was held on Wednesday last week; there was again a good attendance, though many of the provincial members who attended the previous meeting were unable to be present. The President, Mr. C. P. SPARKS, read a number of letters from members for and against the proposal, and stated that before calling the special general meeting to consider the resolution, the Council would ascertain the views of all the members by a post-card plebiscite.

Col. R. E. CROMPTON, who had to leave early, was the first speaker; he said he thought that the proposal to take the matter out of the hands of the Council indicated a want of confidence in the Council, and showed signs of hysteria, of which he was ashamed; they could afford to take the slight risk involved by having Germans amongst their members, but they could not afford to take the risk of displaying timidity or cowardice. He then left the room.

Mr. J. S. HIGHFIELD said he regarded the question as of intense importance; they might take hasty action now of which they would be ashamed in the future. The Council had not the power to expel aliens, but ought to be provided with such power. They had alien members who had become British subjects, and no *bona-fide* British subject should be ejected. Under the old German law, after a period of residence abroad for ten years a German automatically lost his original nationality, and, similarly, he lost it on taking out letters of naturalisation abroad; but a law was enacted in 1913 under which a German might obtain the permission of his Government to become a naturalised British subject and yet retain his German nationality; such a person was the worst kind of alien, and should certainly be expelled. He agreed with Col. Crompton that the powers of the Council should not be curtailed.

Mr. J. H. RIDER, after reading a letter from Sir JOHN SNELL expressing his approval of the proposal, said that genuine naturalised British subjects ought not to be expelled; but alien enemies should be expelled, and never re-admitted. He disclaimed the possession of hysteria. He would have supported the original resolution if it had clearly covered all subjects of an enemy State without dispute. He concluded by proposing a resolution to expel all enemy subjects, and to exclude them permanently, also placing the onus of proof that he had ceased to be an enemy subject upon the shoulders of an applicant for membership.

Mr. C. H. WORDINGHAM, declaring that the Council was by no means pro-German, said that they must consider only the interests of the Institution as an Institution. To him it was an offence to have to associate with a German; if not all Germans had committed crimes, at any rate, no German had dared to protest against them, or would refuse to commit them if ordered to do so. He would exclude all Germans, now and after the war, until the present generation had had time to die out. Some naturalised Germans unquestionably ought to rank as Englishmen; but there were no means of finding out whether a German had been denaturalised or not. Those who got naturalised in order to work for their own country were infinitely more dangerous than avowed Germans who were not naturalised. If a man became naturalised for the purpose of gain, was he worth having? Most naturalised Germans were closely connected with Germans in Germany, and it might be necessary to sacrifice the genuine in order to make sure of removing the traitors. There was no hysteria about him—he had always felt an aversion to Germans. Let them show signs of repentance; then we might consider the question of forgiveness. They should beware lest the trouble were allowed to recur.

Mr. W. RUTHERFORD sympathised with the proposal, but felt that they must differentiate between those who had done many years' good work for this country and others who had not. He asked what was to be done about "neutrals" who were working in Germany against us, and pointed out that an Englishman was regarded as innocent until he was proved to be guilty.

Mr. A. GAY raised the question of voting by ballot on the resolutions, and proposed that all aliens of enemy origin, even though naturalised, should be expelled. He would not trust any German.

Mr. W. L. MADGEN drew attention to the benefits which this country had derived from alien immigration, but supported the proposal to expel subjects of enemy States.

Mr. L. B. ATKINSON said that the most hysterical speaker was Col. Crompton, and it was not fair that he should run away from the meeting. As for taking power out of the hands of the Council—the Council had not adequate powers at present to deal with the matter, and there was no question of want of confidence; they wanted an automatic process of exclusion. He would retain naturalised members if they were also denaturalised in Germany. His aim was to show that they would not associate with people who were hand-in-glove with this "den of thieves."

Mr. A. A. CAMPBELL SWINTON also maintained that a really naturalised alien who retained no allegiance to his native country could not be expelled. Mr. L. JOSEPH thought that all enemies should be dealt with, including neutral members

known to be working against us in Germany, and that it was important to keep them out of the Institution. Mr. BARKLEY suggested that all of enemy origin might be swept out, and those afterwards reinstated who were worthy. Mr. W. M. MORDEY pointed out that a large meeting could not possibly settle a form of words; it would be better to agree on principles and leave it to the Council to embody them in a resolution.

Mr. J. C. WIGHAM protested against the whole of the proceedings, which he thought would not help to end the war; would the amenity of Europe never be restored? and should they imitate the Germans in petty actions, rather than risk retaining one or two dangerous members? Mr. IRWIN also advocated moderation.

Mr. FRANK GILL supported Mr. Mordey's proposal, and asked whether they were legislating for the present war only, or for every future war. He would prefer to leave the matter in the hands of the Council. Reading the letters of naturalisation, he pointed out that the question was a very difficult one, but that it would be better to suffer some injury than to tear up the agreement made with naturalised aliens. Britain had entered the war because Germany broke her agreement with Belgium.

Mr. J. E. KINGSBURY thought they should abide by the laws, and obey the rules by which the Institution was governed. The German nation was not a member of the Institution; they had to deal with individual Germans. To expel naturalised Germans, he thought, would be improper and unlawful. A middle course was advisable, and was provided in the resolution that had been put before them at the previous meeting.

Mr. G. W. PARTRIDGE thought that not the Council, but the members should decide what ought to be done. Dr. S. F. THOMPSON associated himself with Mr. Kingsbury and Mr. Mordey, and thought that they should not deal with aliens *en bloc*, but should give power to the Council to act. He believed that there were no German members who had been naturalised since January 1st, 1914. The whole thing was, in his opinion, a petty matter; but he would support the resolution if the responsibility of acting was left with the Council.

Mr. T. O. CALLENDER said that Dr. Thompson's remarks to some extent justified the suggestion that the Council was pro-German. The members clearly wished to relieve the Council of the necessity of picking and choosing aliens for attention.

The PRESIDENT pointed out that at the previous meeting he represented the Council, whereas on this occasion he had called upon individual members of the Council to speak, and would also speak for himself as a Corporate Member. Most divergent views were held inside the Council. Personally, he would not vote for the exclusion of naturalised members; he drew from history arguments in support of the *bona-fide* immigrant. He then put to the meeting in rotation the various points that were in question, taking the resolution which Mr. Rider had prepared as the basis. First, voting by ballot was almost unanimously rejected; the expulsion of subjects of enemy countries and of "naturalised" aliens who had retained their original nationality was approved by an enormous majority; it was decided that naturalised aliens who were formerly subjects of a State now at war with this country, but who could prove to the satisfaction of the Council that they had lost their alien nationality, should not be excluded, and finally, by a majority of 2 to 1, it was agreed that no subject of an enemy country should be eligible for election to membership of the Institution in the future.

On the proposal of the PRESIDENT, it was agreed that a committee consisting of the Vice-Presidents, Messrs. Highfield, Smith, and Wordingham, and Dr. Russell, and four members should settle the wording of the final resolution to be submitted to the Institution, and Messrs. Atkinson, Swinton, Gill, and Rider were nominated for this purpose. The meeting was then adjourned.

CORRESPONDENCE.

Letters received by us after 5 P.M. on TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

After the War: British Engineering Trade with China.

THE ELECTRICAL REVIEW of December 24th, 1915, reached Hong-Kong only a couple of days ago. It arrived on New Year's Day, Chinese Calendar (our February 3rd). In the Far East, China New Year's Eve is the most important day of the year; not only in business, but in family circles. For on that day every debt transacted during the previous twelve months must be settled. The Chinese shopkeeper is most patient concerning credit at all other times of the year, but he does expect, and demands, payment on, or before, China New Year's Eve. The reaction follows. During New Year's Day, and almost for a week afterwards, all business is suspended. A perfect orgy of cracker firing and feasting marks the beginning of the holiday. If you are fortunate enough to have friends among the Chinese, you pay numerous calls in the morning of their New Year's Day; then, when that duty

is done, you may enjoy that greatest of all delights for the exact engineer, read and digest the technical papers from "home."

During the morning of February 3rd the writer called upon some prominent local Chinese. In all cases the conversation flowed mainly along trade channels. It had been a good settlement. There was plenty of money about. It seems that the Chinese are anxious to invest their money in British companies in Hong-Kong and Shanghai. There has been a most extraordinary "boom" in shipping. The Chinese are born gamblers, and they rush to the fluctuating share market. Shipping and rubber companies have been entertaining them in a manner which causes them ecstasy. My friends, who are fortunate, tell me of shipping shares which have trebled in value in the past year. Even that staid and steady institution, the Hong-Kong and Shanghai Bank, which we Britishers think as stable as the Bank of England, even that has presented to the Chinese opportunities for gambling or speculation, whichever you like to call it. When the war commenced there was a fall in the shares. If, in that August of 1914, you had faith in the British Empire and bought "Banks" at 700 dollars, you can sell them to-day for 820 dollars. Which, together with the demand for, and rise in, the shares of the British shipping companies, goes to show that faith in the British Empire has greatly increased in the Far East. It must be very annoying to those Germans who are spending all of their Boxer indemnity money, and a good deal of their own spare cash, in proving to the Chinese that the British Empire is a back number.

It is quite useless to expect the Chinese to do any work during their New Year holiday. If they were at war they would most certainly refuse to fight at such a time. There is an enforced vacation, not only for students, but for all contractors and mechanics. Since the writer is employed, normally, either in teaching Chinese students the hidden mysteries of British machinery, persuading contractors to install the same in his laboratories, or seeing that mechanics and coolies keep it in working order, he took a compulsory holiday from such things. Having paid his respects to his Chinese friends, he spent the rest of the vacation with those best of all English companions, the technical papers. And it seemed that wherever his eyes wandered, the home journals were full of trade problems and discussions.

In the issue of the ELECTRICAL REVIEW mentioned above, the following, from the list of contents, proved of an enticing nature: First of all came the article "British Business Methods which must go." Then "Trade Statistics of the Straits Settlements." Next "Exports and Imports of Electrical Goods during November, 1915." Finally, the two pages devoted to "After the War," which gave the views of members of those two very dissimilar British institutions, the House of Lords and the B.E.A.M.A. Although the report of the discussion by members of the B.E.A.M.A. was only awarded small type, it seemed more entertaining than the opinions of Earls and Viscounts.

The first-mentioned article deals with problems of finance as applied to engineering schemes. So much has been written on this subject with reference to the market in China that little else remains to be said. It may be of interest, however, to repeat that the Chinese people do not like to pay in advance. One reason why the theatre does not flourish in their country is that they don't like paying for an entertainment of whose value they are uncertain. There is the story of the German who introduced a cinematograph at Chengtu, a place many hundreds of miles inland. It is situated in the province of Szechuan, which European geologists and mining engineers report as containing in abundance almost all the minerals used by engineers. When the picture show commenced no one would patronise it. "Fancy paying money for a thing you cannot see before you part with your cents," they said in amazement. Finally the thing succeeded; but only because money was lost at first. The astute Touton gave a few free performances, and probably collected his money as the people left the entertainment, well pleased with themselves and the show.

The "Trade Statistics of the Straits Settlements," which give the imports of electrical and other materials into the various Straits Settlements during 1914, are important, for the people who have made the Straits Settlements are the Chinese, aided by the British Government. The latter has ensured for the former a fair field and just taxation. The former have developed the natural resources of the place. The largest individual donor to the Hong-Kong University is a Chinese millionaire in the Straits Settlements. He emigrated from a place about 100 miles away from Hong-Kong, with less than the proverbial sixpence. A combination of stable government, undeveloped natural resources, and the amazing industry which is a characteristic of the Chinese, has made this man a millionaire. One of my students tells me that even he, a great example of up-to-date enterprise in the Straits, uses the most elementary methods for working his valuable tin mines. Apparently, nearly a quarter of a million pounds' worth of electrical machinery and similar materials was sent from Great Britain in 1911. A great deal was sent from other countries. It is the Chinese who are creating the demand

much, and Hong-Kong is the distributing centre for South China. Again, the Straits Settlements took more than Hong-Kong. Japan and Korea took more than twice as much as the Straits. It is very probable that a great proportion of the goods for Japan were re-shipped to North China. The writer has evidence of the Japanese buying quantities of expensive surveying instruments in England for use on Chinese railways. These places, in the Far East, took 10 per cent. of the British exports of electrical goods, despite the fact that, during the same month, Russia took 20 per cent. of the total. After the war . . . it seems feasible that, with all of the money available at China New Year, 1916, with knowledge of the fact that money is to be made in engineering enterprise in the Far East, with the natural resources available and undeveloped—it is feasible that after the war the electrical imports to the Far East will increase.

The report of the discussions under the title "After the War" shows that, despite the terrific strain of the awful struggle in Europe, our Statesmen and our business men are really thinking out these problems of overseas markets. "Viscount Haldane . . . prophesied that when peace came we should be found less prepared for it and its problems than we were for war." But were we really so unprepared for war? It apparently took our Statesmen several months to reach a conclusion which Mr. Lloyd George announced with all the pride of a man making a wonderful discovery. "This is an engineers' war," he said, months and months after the technical papers had reminded their readers of what every engineer knew instinctively in August, 1914. The Statesman will be unprepared for the realisation that when the fighting in Europe is over there will be another war in the markets of the world. That, also, will be an engineers' war.

At the B.E.A.M.A. meeting Mr. Lee Murray put the great problem which must be solved by Britishers in a dozen words: "Having got the equipment," he said, "it was necessary to get the foreign market." This was perhaps a less explicit way of saying what Mr. T. C. Elder pointed out earlier in the meeting: "British engineering had given an amazing example of industrial development. Its productive capacity had increased enormously during the past 15 months, and the shock of peace would be more staggering if the industry did not make timely preparations. The capital invested, the plant laid down, and the workers trained, to meet war needs, must all be utilised." This is a real problem which needs carefully thinking out. The solution involves the development of the natural resources of other parts of the world. It dazzles the imagination to think of the trade boom which will come about when the natural resources of China are utilised for the use and convenience of man. Mr. Dunlop was not strictly accurate when he said "Japan had secured virtual control of Chinese internal trade." There is still plenty of opportunity for British manufacturers. The market must be cultivated.

We have seen the seamy side of German morality, even in the Far East. We have read of the Bryce Commission, the *Lusitania*, and the other infamies. In 1912—two years before the war—the writer spoke about the need for Britishers to combine against these traders. We know their brutal outlook, and we loathe them. But, just as we have copied their lead in the matter of high explosives and machine guns, so must we copy some of their enterprising methods to secure trade.

When the German Government established themselves in Shantung Province, North China, they quickly discovered that the Chinese farmers were poor. They found out that the soil was worked out, and fertilisation was done in an elementary and crude fashion. They sent out fertilisers from Germany. They notified manufacturers, and they provided a market for them. German moneylenders supplied the necessary credit. When the money came in from the first crop, which was a splendid one, they obtained good interest. Thus the Chinese farmer benefited; so did the German manufacturer of fertilisers, the German moneylender, the German shipping company. The prestige of the German increased with his trade.

Just as in this war in Europe, the British engineering manufacturer is overhauling, and will finally smash, Krupp's, so will he obtain his full share of the trade which must be obtained when the war is over. He has done well in the past, but he will do much better in the future.

Wherever you go in China you will find the seven cent Mei Foo (amiable and trustworthy) lamps of the Standard Oil Co. These lamps have created an enormous demand for kerosene, so that all over China you find the kerosene tin used as a receptacle for the household fluids. A certain firm of tobacco manufacturers are as ubiquitous. Just at present China has awakened to the advantages of electric light. The metallic filament lamp is competing with the seven cent Mei Foo, even in places where they seldom see a white man. The heat of the steamship and motor-boat is heard on the inland waterways. It is all pioneer work, but it is encouraging to those who believe in progress. It was Great Britain who first saw the possibilities of trade with China, in the days of King George III. We have sufficient faith in the British manufacturing engineer to believe that he will reap a good crop in the Chinese market after the war. He will do so because he will make the necessary effort.

C. A. Middleton-Smith, M.Sc.

Hong-Kong University, February 6th, 1916.

The "Exports and Imports of Electrical Goods during November, 1915," show, as a feature, the large Russian business. China and Siam, where the Chinese also flourish—took about the same as Canada. But Hong-Kong took nearly twice as

An Engineer's Wages.

I have read with interest the remarks passed under the above heading in your current paper, and as a graduate of similar qualifications as the advertiser in question, I wish to state since the conclusion of my college training, that is last June, I have been unable to obtain a suitable position, whether of a technical or practical character.

Twice my applications were not favoured even with a formal reply. All I am offered is a mechanic's work with "low wages," and I have come to the conclusion that experienced, mostly practical, men are those wanted, while qualified technical men, fresh from the college, find little encouragement in their work.

London, March 12th, 1916.

Experience.

"Wireless Wiring."

I see in your issue of the 3rd inst. that you have reproduced my letter to Mr. F. Miller, of the G.E.C., and I only hope that those who read it will not be led away with the idea that we are having a time of all play and no work. The original intention was to give an entertainment to our own men at Christmas, and to run the show for three evenings, but owing to the huge appreciation it met with we continued for the week. Afterwards we were commanded to run a week at each of two other places where English troops were congregated. This we did, and, I am pleased to say, gave a pleasant evening to an aggregate of over 15,000 men. . . .

I have been out here since the very commencement and am fairly well hardened, but am looking forward to that much-spoken-of period—"after the war."

Arthur E. Watts (Corpl.).

[Corpl. Watts need have no misgivings; our readers will know that their friends and brothers at the Front are not out there for fun, and there is not one who would grudge them the pleasure of an entertainment on the rare occasions when Corpl. Watts and other enterprising and able organisers have the opportunity to provide it. We only wish such opportunities were more frequent, and we congratulate our correspondent upon the striking success of his efforts.—EDS. ELEC. REV.]

Meter Transformers.

I should be extremely obliged if you or any of your readers could tell me the name and publisher of any book dealing exhaustively with the design and special characteristics of small current and potential transformers for meter work only.

Meter Engineer.

The I.E.E. and Allen Enemy Members.

The signatories to the following letter addressed to the Institution prior to last Wednesday's meeting will be obliged if you will be kind enough to publish it in your next week's issue.

[Copy.]

W. T. Anderson.

P. F. ROWELL, Esq., Secretary,
The Institution of Electrical Engineers,
Victoria Embankment, London, W.C.

DEAR SIR,—Several members of the Institution who cannot attend your meeting in London to-morrow feel that it may assist those present to arrive at a satisfactory resolution if they have before them a copy of the addition to the rules of the Engineers' Club, Manchester, which was adopted when the members had the same problem before them. The rule in question reads:—

"No one of German, Austrian, Turkish, Bulgarian, or other alien enemy birth or nationality, whether naturalised or not, may be introduced into the Club, either as a member or as a visitor."

It is agreed that this wording is not suitable for the Institution, but they suggest it might be modified somewhat as follows:—

"No one of German birth or nationality, whether naturalised or not, may remain a member of this Institution after (date) or be introduced into the Institution in the future, either as a member or a visitor."

Further wording will be necessary to bring this rule into general conformity with the existing Articles, but this may safely be left to the Council's legal advisers.

(Signed) S. L. PEARCE,
W. WALKER,
H. T. WILKINSON,
H. ALLCOCK,
W. T. ANDERSON.

Manchester, March 7th, 1916.

Reflectors for Half-Watt Lamps, Etc.

In your issue of December 17th, 1915, we offered for sale by fig. 8 a pattern of reflector for half-watt lanterns, subsequently alleged by the Benjamin Electric, Ltd., to be an in-

fringement of one of their Registered Designs. At the time of said issue we were unaware of the existence of said registered design. Without prejudice to any rights we may have, we entirely withdraw said pattern fig. 8, and all lists which may contain said pattern. Said lists by numbers 6,811-2, 6,819-20, 6,808 and 6,809 also show additional patterns alleged by the Benjamin Electric, Ltd., to be infringements of certain of their registered designs, and these additional patterns we also, without prejudice, entirely withdraw.

Townsend's, Ltd.,

E. TOWNSEND, Director.

Birmingham, March 10th, 1916.

WAR ITEMS.

Exemption Applications.—The Trafford Park Estates Co., Ltd., appealed to the Stretford Tribunal last week for the exemption of a consulting electrical engineer on the ground that he was employed in an occupation in which it was in the national interest that he should be retained. He had attested, and was in group 21. In answer to the Tribunal, he said he resided and had his business in London, but for the greater part of each week he was in the service of the company in Manchester. The point was raised whether the attested man, being a consulting engineer, was an employee of the company, and one member suggested that the point might be referred to the Central Tribunal in London. In the end, however, the claim was disallowed.

Among a number of conscientious objectors to military service, who appeared before the Oldham Tribunal last week, were two men employed as instrument makers at the electrical works of Messrs. Ferranti, Ltd. They said they had not left their employment because they were on civil work, and the meters they made were for private houses. It was pointed out to them that they could not tell whether the work was civil work or not, and that the logical position for them was to have left their employment and found other work which they could be certain had nothing to do with the war. The members of the Tribunal made it clear that they did not suggest that the men were doing wrong in working at the electrical works named, but it was suggested that they were not acting consistently. The men were referred for non-combatant service.

At the Wigan Tribunal application was made by Mr. H. Bull, assistant electrical engineer, for the exemption of a meter inspector and repairer and tester of installations. It was stated that his services were of great value. There were men doing twelve hours' shifts in several of the departments, and if they left it was not known how they would be replaced. The electricity department had already lost 25 to 30 per cent. of its employees. Three months' postponement was granted.

The Cardiff Tramways and Electric Lighting Committee was asked to consent to an appeal being made to the Tribunal for three lighting attendants. The request was made on the ground that the department was already much depleted in staff, and that male labour could not be obtained for the work, which was unsuitable for women. The Committee declined to appeal for the men, and Councillor J. Taylor said that if the need came and the work must be done, Councillor F. W. Blower and himself were prepared to help to do it.

At the Herne Bay Tribunal Mr. A. R. J. Creasey, electrical engineer, asked for absolute exemption on business grounds, and because he was doing work of national utility. On his application the case was heard in private. On the re-opening of the court the Tribunal allowed a fortnight's exemption, adding: "This will give you, with the two months which you have got under the Act, ten weeks in all."

The "Times" states that, at the County of London Tribunal, an assistant electrical fitter and storekeeper, whose firm is engaged on an Admiralty contract, was allowed a month's postponement so that he may complete the job on which he is at present engaged.

At the Darlington Tribunal an application by an electrician, carrying on business on his own account, was refused. It was stated that since his case was heard on a previous occasion he had made no effort to wind up his business.

At Eastbourne an electrician claimed that he was in business for himself, and if called to the Colours he would have to "close down." His application was refused.

At the Bury St. Edmund's Tribunal application was made on behalf of the manager of the electricity works, and exemption granted so long as he remains in his present position. Exemption was sought on behalf of the chief working electrician employed at the works, and in his case also exemption was granted so long as he continued in his present employment.

Before the Eleton Tribunal the electrical engineer engaged by the Urban Council applied for exemption in respect of an electrician and switchboard attendant. The application was based on the grounds that the man was

employed in public service as a temporary substitute for an enlisted man, that it took seven months to train him for the work; and that the staff at the electricity works was already reduced to a minimum. Exemption was granted conditionally on the man remaining at the present occupation.

Before the Hampstead Tribunal, an electrician engaged in business at Kilburn applied for exemption for an employee. Asked whether his application was made on the ground of national importance, he replied that he would have to give up the whole of his business. He had tried to get somebody else to do the work, but mechanics could not be found. The Tribunal said that no appeal on the ground of national importance had been made, and exemption was not granted.

The "Times" states that a manufacturer of dry batteries applied to the Islington Tribunal for the exemption of a young man to whom he had imparted his trade secret. The applicant said the making of dry batteries was largely a German business, and there were only two manufacturers besides himself in this country who had been successful in making the proper article. He had three sons at the front. He was negotiating for Government contracts. Rather than instruct another stranger in his secret he would give up the business, which employed 80 to 100 people, and sacrifice £70,000. The Tribunal decided that the applicant must get a badge for the man if he was to be exempted.

The Wolverhampton Tribunal granted a three months' extension to the managing director of a firm of manufacturers. The applicant stated that he had discovered to some extent a secret process in the treatment of steel for electrical purposes, which had been previously exclusively used in Germany.

The Imperial Tramways Co., Ltd., applied to the Stockton-on-Tees Military Tribunal for the exemption of the company's chief storekeeper and cashier on the ground of indispensability. One hundred and ninety-eight members of the staff had joined the Forces, and there was not now an unattested man of military age in the company's employ. The Chairman granted postponement for three months, with liberty to apply again.

At Nelson Tribunal, on March 9th, the Tramways Committee appealed in respect of the traffic clerk, Captain Smith (for the military) said the clerk was not fully experienced, and was only put in the position recently. The Tramways Committee could put a rejected man in his place. The tramways manager said the trams would have to stop if the man went. It was absolutely impossible to go on working. The department had been reduced materially. Only 13 were employed on work similar to that they did before the war. A month's exemption was granted.

At Blackpool Tribunal, on March 9th, Mr. Furness, electrical engineer, appealed for four single men employed in his department. The Mayor said the men were indispensable. There were 107 men at the beginning of the war, and 43 had enlisted. Mr. Furness had been one of the keenest recruiters on the committee. These were technical men whom it would be impossible to replace. Mr. Furness said the men were sub-heads of departments. He was not there on personal grounds, but as representing the Corporation. One was engineer-in-charge, and when on shift duty was responsible for all the machinery. If he could replace them with married men or men unfit for service he would do so. It was beyond human endurance to expect men to go on week after week doing two men's work. There were 30 to 50 advertisements appearing every week in the electrical papers seeking engineers and offering them war badges as a protection from military service. He would not keep any man out of military service if his place could be filled. Conditional exemption was granted.

At Southport, last Friday, Messrs. F. W. Smith & Co., Ltd., electrical engineers, of Southport and Manchester, sought exemption for James W. Smith, the manager of the Southport office and a director of the firm. It was urged that he was in a "starred" trade, but the military representative said that he could find nothing in the list of reserved occupations except relating to electricians connected with public electricity supply works. Postponement to May 1st was granted.

Electrical and other Companies to be Wound Up.—Further orders, issued by the Board of Trade under the Trading with the Enemy Act, 1916, require the following businesses to be wound up:—

Electrical Co., Ltd., 122-124, Charing Cross Road, London, W.C. Controller: Maurice Jenks, 6, Old Jewry, London, E.C.

Balashol Belting Co., Ltd., 13, Lambton Street, Sunderland. Controller: William Swan, 31, Mosley Street, Newcastle-on-Tyne.

British Graetz Light, Ltd., 26-36, Chapter Street, Westminster, S.W. Controller: Thomas Wise, Bassishaw House, Basinghall Street, E.C.

Jaeger Bros., 9, Rathbone Place, Oxford Street, W., manufacturers and suppliers of electric lighting accessories. Controller: Maurice Jenks, 6, Old Jewry, London, E.C.

Hanover Rubber Co., 105, Goswell Road, London, E.C., rubber goods merchant. Controller: Geoffrey Bostock, 21, Ironmonger Lane, E.C.

Exports to China.—The "London Gazette," of March 10th, contains a further list of seventeen bodies or persons to whom articles to be exported to China may be assigned.

Women in Industry.—The President of the Board of Trade, after consultation with the Home Secretary, has appointed an advisory committee with the following terms of reference:—

1. To advise the Board of Trade and Home Office on questions arising from time to time out of measures required to be taken by those departments to give practical effect to the policy of His Majesty's Government of extending the employment of women in industrial occupations so as to enable essential industries to be maintained in spite of the depletion of their supply of male labour by recruiting for war purposes; and

2. To watch and report from time to time on the progress made in different localities and industries in the extension of the employment of women.

Mr. F. Lavington, of the Board of Trade, and Mr. M. H. Whitelegge, of the Home Office, have been appointed joint secretaries to the committee.

Birmingham and Enemy Contracts.—At Birmingham City Council last week Sir William Bowater, replying to a question, stated that the Manchester resolution urging that no contracts should be entered into with enemy firms, had been discussed by the General Purposes Committee, but it was not considered necessary to deal with the question. "Some councils in the country," he added, "seem to have time to pass abstract resolutions, but we have not here." The General Purposes Committee thought the best thing to do was to order the resolution to lie on the table.—"Morning Post."

An Edison Piano.—A concert was recently held at the Edmonston Military Hospital, at which a piano, stool, and invalid chair were presented by the Edison staff and employees. The idea of the presentation originated with Miss F. Wootton, a member of the Edison staff at Ponders End, who started a collection amongst the staff and employees of the company, a grand total of £33 being got together. The talent on the occasion of the concert was chiefly contributed by those in the service of the Edison and Swan Co.

An Electrician!—At the Richmond (Yorks.) Tribunal, an electrician applied for exemption on conscientious grounds. Replying to questions, he declared that he would do nothing to oppose the landing of Germans in England, and expressed the opinion that he would be as well off under German as British rule. If women were violated he would not interfere, but would look upon such incidents as accidents. At this stage the Tribunal declined to listen further, and refused the appeal.

Enemy Trade in Egypt.—The "Times" correspondent at Cairo says that the Egyptian Government has appointed a special Commission on Commerce and Industry to examine the extent to which the industries and commerce of the country have been affected by the war, and to propose measures for opening up new markets for Egyptian products and for replacing articles formerly obtained from enemy countries by articles either locally produced or imported from non-enemy countries.

War Relief Funds.—Since September, 1914, the employees of the India-Rubber, Gutta-Percha & Telegraph Works Co., Ltd., at Silvertown, have been contributing to various funds, and the total is now £1,300. Nearly £700 has been sent to the Prince of Wales's Fund, nearly £350 to the British Red Cross Society, £260 to the Belgian Relief Fund, and lately contributions to the Serbian Relief Fund and the Anglo-Russian Hospital at Petrograd, have been started.

"No Room for Germans."—This is a familiar battery of our Australian brothers in their fight against German trade influence, and we read that the Sydney Legislative Assembly has passed the first reading of a Bill to disqualify, during the period of the war, all enemy-born subjects from voting at municipal and parliamentary elections.

The Foreign Trade Department.—The daily press states that a list of business men to act in an advisory capacity has been submitted, at the request of the Foreign Trade Department, by the London Chamber of Commerce.

Swansea Corporation Contracts.—A special committee of Swansea Corporation has resolved that no contract shall be entered into with any person of German or Austrian birth, or with any firm controlled by such persons.

Russia and the Trade War.—More than a thousand members of the Russian War Industries Committees have assembled in Petrograd to report progress and to concert more intensive action.—"Times."

No German Members.—The Council of the London Chamber of Commerce has resolved that no German or Austrian born subject, naturalised or not, shall be eligible for election as a member of the Chamber until otherwise determined by the Council.

Electric Motor Vehicle Construction in the United States.—According to a report lately issued by the U.S. Bureau of the Census, in Washington, the number of electric motor vehicles constructed in the United States during the year 1914 was 4,715, an increase of 22.9 per cent. over the output in 1909.

Electrical Trades Benevolent Institution.—The annual meeting of this Institution will be held at the Institution of Electrical Engineers, on Monday, 27th inst., at 2.30 p.m. The report and accounts for the year will be submitted, and members of the Committee of Management and the auditors will be elected.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Lineman's Shoe.

An American company has developed a new insulating shoe for electrical workers; throughout their entire life a pair of these shoes, the manufacturer states, will provide the wearer protection against circuits at pressures up to 20,000 volts, and will not cause the discomforts of many rubber shoes.

The shoes contain no cement and have no seams, but are vulcanised into a solid piece under high pressure on aluminium molds. No hand work is employed in the process.

The white soles are made of a rubber composition like that employed in certain types of coal miner's shoes, which have been found to give 18 months of constant wear. When this white sole wears through, a layer of red rubber, which will itself withstand a pressure of 20,000 volts, is exposed. The appearance of the red rubber is a signal or reminder to the wearer that, although his shoes will still withstand 20,000 volts, a new half sole should be immediately cemented or vulcanised in place. No metal is used in any part of the shoe.—*Electrical World*.

Western Electric Interphones.

The WESTERN ELECTRIC CO., LTD., of Norfolk House, Victoria Embankment, W.C., have brought out a neat and well-made pattern of intercommunication telephone, as illustrated in fig. 1.

The case is of walnut, with plated fittings, and the hand microphone switch is arranged so that the same instrument can be adapted for use either as a table set or wall pattern; pressing the button of the line required, both selects the line and rings up the station, and to answer it is only necessary to remove the hand-set from the switch. Replacing the hand-set automatically restores all the keys to the normal. The system is arranged for central-battery working, so that only two batteries are required, one for speaking and the other for ringing. Standard sizes are made for 6, 12, 18 and 24 buttons. It is claimed that by the judicious combination of light metal framework, light woodwork, and ornamental plated fittings, an instrument strong enough to stand the heaviest service, and yet neat in appearance and of small dimensions, has

FIG. 1.—WESTERN ELECTRIC CO.'S INTERPHONE.

been devised, and certainly we can find no fault with the result, either inside or outside the case. For convenience of examination and adjustment, the top cover opens on a hinge, and, for access to the cabling, the whole body is hinged to the backboard. The hand-set is fitted with a capsule transmitter and a bipolar receiver.

Electric Invalid Chair.

There has recently been illustrated in the *Daily Mirror* and elsewhere, an electrically-propelled invalid chair of a type which is excellently adapted for the use of convalescent patients in hospitals, and, indeed, for use on the sea-front promenades around our coast and at inland health resorts.

This chair, which has been constructed by the ELIENSON ELECTRIC TRACTION CO., of 85, Newman Street, W., and is the invention of Mr. C. P. Elienson, is equipped with an Elienson 40-volt traction battery, carried under the seat, which supplies current to a low-speed motor, of about $\frac{1}{2}$ H.P. rating, which is fitted under the hood in front of the vehicle, and drives by means of a vertical shaft and worm gear, giving a 20 to 1 speed reduction, the two front wheels of the chair. The occupier of the chair controls its movements by a small lever placed on one side of the chair, which gives four speeds, and in a fifth position applies a band brake sufficiently powerful to hold the vehicle on a hill. A small interlocked reverse switch near the control lever provides for the same speeds, &c., being obtained by the latter in a reverse direction.

The chair weighs roughly $2\frac{1}{2}$ cwt., the battery accounting for

60 lb., and the apparatus over the front wheels about 80 lb., of which the motor weighs 35 to 40 lb.

On a normal charge the carriage will travel some 20 miles on a level surface, the battery discharging at the rate of 4 or 5 amperes

FIG. 2.—ELIENSON ELECTRICALLY-PROPELLED CHAIR.

under such conditions and the speed being 4 or 5 miles an hour. We illustrate in fig. 2 the electrically-propelled chair, with the inventor, Mr. Elienson, at the helm; we understand that the vehicle attracted considerable attention at one London hospital where its capabilities were informally demonstrated, and judging by the interest taken in the first announcement of its appearance, there should be a considerable future for it.

LEGAL.

THE WAR AND GERMAN TELEPHONE CONTRACTS.

IN the King's Bench Division, on Monday, Mr. Justice Bray had before him an action brought by the Birmingham Private Telephone (New System) Co., Ltd., against the Deutsch Privat Telefon Gesellschaft and H. Fould & Co., of Frankfurt-on-Main, and Mr. Alfred Gunz, formerly chairman and managing director of the plaintiff company, and now interned as an alien enemy, for a declaration that three contracts, dated January 4th, 1911, were determined by the outbreak of war, and ceased to be binding.

MR. DISTURNEL, K.C., appearing for the plaintiffs, said that they were an English company incorporated in August, 1911, and carried on business as dealers in private telephone installations. The company was promoted by Mr. Gunz to take over and work in the Midland Counties three contracts between himself and the German company, by which he held the exclusive right to dispose of the German company's goods in the counties of Stafford, Worcester, Warwick and Salop, and agreed not to buy or deal in any other apparatus than that sold by the German company. The contracts were to last for 35 years, and they were terminable by six months' notice. Mr. Gunz also undertook to form a company to take over the obligations and benefits of the contracts. Though the plaintiff company was formed in 1911, Mr. Gunz did not make a formal assignment of the benefits and obligations of the contracts before the outbreak of the war, but the companies worked together as if such an assignment had been made and the plaintiff company had been substituted for Mr. Gunz. In November, 1914, however, he purported to execute an assignment of the contracts to the plaintiff company. Mr. Gunz had since got rid of his shares in, and ceased to be a member of, the company, which was now being worked with English capital and by English directors. But it was impossible for the company to carry on business unless it could enter into contracts for the purchase of goods from English manufacturers. Therefore, the company came to the Court and asked for a declaration that the contracts between Mr. Gunz and the German company were determined by the outbreak of the war.

MR. F. T. JACKSON, managing director of the plaintiff company, said that the capital of the company was £2,500. Up to the outbreak of war the plaintiff company had disposed of about 2,000 instruments and the average price was about 55s. each. Since the war Mr. Gunz had ceased to be a director and shareholder of the company. The present directors and shareholders were all British subjects. There were about seven similar companies in this country.

MR. HOGG (for Mr. Gunz) said his client had no interest in the contracts, and did not want to do anything to interfere with any right the plaintiff company might have to any declaration his Lordship thought fit to grant. But, as he had been made a

Patent Restoration.—An order has been made restoring Patent No. 24,949, of 1910, granted to Heenan & Froude, Ltd., and Fred. Harrison, for "Improvements in Dynamometers."

Bankruptcy Proceedings.—J. R. WHITEHOUSE, managing director of an electrical company, Golden's Green. Receiving order made on March 9th at Barnet, on a creditor's petition.

G. J. T. J. PARFITT, consulting electrical engineer, Keyneham. —Trustee released, February 10th.

German Samples from Brazil.—The Board of Trade Commercial Intelligence Branch in London has received from the Acting British Consul-General at Rio de Janeiro samples of German electrical goods imported into Brazil. These may be seen at the Foreign Samples Section at 32, Cheapside, E.C. They include brackets, lamp sockets, porcelain rose sockets, porcelain insulators, fuses, commutators, bell accessories, reflectors, &c.

Trade Announcements.—MESSRS. ERNEST G. DENNER AND CO., wholesale electrical engineers, of West Street, Sheffield, have taken new premises with stores, at 284, Glossop Road, where all communications should be addressed. The stores are in Victoria Street.

MESSRS. THERMIT, LTD., with a view to centralising their business, have removed their registered offices to new premises recently erected at the works, 675, Commercial Road, London, E. Telephone No.: "East 4157."

C.T.S. Authorised.—The ST. HELENS CABLE AND RUBBER CO., LTD., draw our attention, with pardonable pride, to the fact that under the title "tough rubber compound protection" the Institution Wiring Rules, as newly revised, recognise and approve of the use of cable-sheathed cable without conduits or wood casing (Rules 33 and 65). The company, however, do not propose to substitute "T.R.C.P." for the well-known "C.T.S."

Catalogues and Lists.—MESSRS. D. HULETT & CO., LTD., 55 and 56, High Holborn, London, W.C.—Illustrated circular stating prices of special shades for screening electric lamps.

TELEKLYT CABLE AND PARA RUBBER CO., 38, Bath Street, Glasgow.—Illustrated circular giving prices and particulars of pocket voltmeters and voltmeters, also switchboard surface meters.

LIGHTING AND POWER NOTES.

Accrington.—Ald. Higham speaking recently on the subject of the electricity department, said the minimum of extensions were being carried out to enable them to cope with increasing demands, and would only partly remedy their difficulties, the plant being seriously overloaded. If the gas plant was not doing all that was expected, it was due to inability to get suitable fuel for the producers and to by-products being commandeered. He anticipated a heavy and unavoidable loss on the year's working.

Ashton-under-Lyne.—PRICE INCREASE, &c.—After the current quarter, charges for current are to be increased by 10 per cent. for lighting purposes and by 25 per cent. for direct-current power and heating purposes.

The borough electrical engineer, his assistant, and the mains superintendent have applied for remuneration for extra services necessary through the depletions of the staff caused by enlistments, and it has been decided to grant a bonus of £100 for the year commencing March 25th next.

Bradford.—The Finance Committee of the Guardians recommends agreement with the proposal to light the new buildings at Bowling Park Colony with electricity, and that a guarantee be given to the Corporation ensuring a minimum revenue of £150 per annum for a period of seven years.

The Electricity Committee has given instructions for the preparation of the foundations for the proposed new cooling plant, and to obtain quotations for the requisite additional feed pumps; application is to be made to the L.G.B. for the necessary borrowing powers for the additional plant.

Burton-on-Trent.—PRICE INCREASE.—To meet the extra cost of coal, amounting to about £2,000, the Electricity Committee has decided to increase the price of electricity by 15 per cent., as from March 31st. The question of insuring both the electricity and gas works against air raids has been considered and they are to be fully covered.

Canada.—The Ontario Government has decided to purchase, for £1,670,000, the Consolidated Electric Power Co. and 22 subsidiary companies operating in Central and Eastern Ontario. The acquisition of these concerns will enable the Government to duplicate in Eastern Ontario the work already done by the hydro-electric system in Western Ontario.

Church Stretton.—PROV. ORDER.—The U.D.C. has given its consent to the Church Stretton Electric Supply Co.'s application for a provisional order for the supply of electricity within the urban and rural districts of Church Stretton.

Continental.—ITALY.—HALF-WATT LIGHTING.—According to the Italian journals a good deal of attention is being given to the substitution of half-watt lamps for arc lamps in the streets of Italian cities. As mentioned on p. 286 of our last issue, the authorities in Rome have largely adopted this type of lamp and a similar substitution of lamps is occurring at Brescia, Parma, Naples, &c. At Brescia some 400 ½-watt lamps, of 600-c.p. size, are now in use in the principal streets, the lamps being supplied in groups through 24-kw. transformers, or in emergency from the private supply network. It is held that there are considerable operating advantages in this type of lamp, but it requires more current and the light falls off in time. At Parma there are installed 250 680-c.p. lamps, which are run in series groups and provided with supplementary resistances. About 50 100-c.p. lamps have also displaced gas lamps, and the results are regarded as technically and economically satisfactory. At Naples an experimental installation of 60 ½-watt lamps is being made in place of arc lamps in the city's principal street; these will be run in series of 10, with supplementary resistances, with a view to using existing lighting circuits.

Owing to avalanches in the Agordo Valley, the Falcade electric works and many other buildings, have been destroyed.

Dover.—The Government has renewed a loan of £157,000 for seven years from May 6th, with power to pay off at six months' notice after five years, the rate of interest to be ½ per cent. above the rate payable on the last War Loan, with a minimum of 5 per cent. The L.G.B. has sanctioned a loan of £3,814 for new cable.

Dublin.—ESTIMATES.—A report submitted by the Electricity Supply Committee to the Estates and Finance Committee in connection with the general rate estimates for the coming year, states that the sales to March 31st should work out at 8,529,826 units, comprising 4,339,364 lighting units and 4,190,462 power units, the former a decrease, compared with 1915, of 69,167 units, and the latter an increase of 345,595 units. The receipts should work out at £113,297, an increase of £18,386 over 1915. Taking into account the surplus brought forward from the 1915 accounts of £7,940, together with the anticipated surplus from the current year's working, it is expected that the income for 1917 will meet the running and maintenance expenses, and provide for the annual capital charges, provided that the cost of coal does not exceed 27s. 6d. per ton. The estimated increase in expenditure is £11,325, and it is pointed out that the cost of coal increased by £11,523 over the previous year, and the cost of carbons by £645, while the cost of general maintenance materials rose by 25 per cent. to 65 per cent. The Estates and Finance Committee concurs in the views expressed in the report.

Eastbourne.—PRICE INCREASE.—The T.C. has decided to increase the charge for electricity for lighting purposes from 5d. to 5½d. per unit, as from April 1st next.

Edinburgh.—HEATING CHARGES.—The E.L. Committee has decided, with a view to abolishing duplicate wiring and meters, to adopt the system in use in Glasgow for charging domestic consumers, i.e., to charge the consumer for a fixed number of units for lighting, the amount being based on the average use by such consumers, and to charge all units in excess at a low rate, in this case 1½d. per unit. The scheme will come into force on May 15th.

Exeter.—WORKHOUSE LIGHTING.—The B. of G. has, by 10 votes to 7, rejected a proposal in favour of deferring until after the war the introduction of the E.L. in Block 3 of the institution, at a cost of £50 or £60.

Glasgow.—FIRE.—According to the daily papers, damage amounting to £2,000 was caused by a fire in the electric generating building of the Victoria Infirmary recently.

Ilkeston.—The Tramways Committee has fixed the lighting rate at 4d. per unit, with reductions for quantity; for power the charge will be 2½d. to 1½d. according to consumption, and for heating, &c., 1½d. per unit. Electricity supplied through prepayment meters will be charged 4½d. per unit.

Ipswich.—TALE OF A DESTROYER LOAN.—The L.G.B. has refused sanction to a loan for £3,200 for duplicating the refuse destructor, apparently because the Council entered into contracts for the plant before the work had been sanctioned. It appears that the latter course was taken under pressure by Government departments, including the L.G.B. itself, and this fact is to be brought to the notice of the latter, with a view to its sanctioning the borrowing of the money.

London.—HAMPSTEAD.—The B.C. has adopted the recommendations of the Electricity Committee that the estimated deficit, £3,528, for the year ending March 31st next, on the Council's electricity undertaking, shall be met out of the reserve fund; and that the charges for electricity be increased by 10 per cent. as from the beginning of the next December quarter, and that six months' notice to this effect be given to all consumers.—*Hampstead Express.*

FULHAM.—The Electricity Committee recommends an expenditure of £950 on cables and equipment to supply Townmead Engineering Works, which firm has guaranteed the Council a revenue of not less than £1,000 during a period of three years.

With reference to the linking-up of the Battersea and Fulham electricity undertakings, the Committee has received an application from the Battersea B.C. for a supply of at least 700 kW. for

the ensuing year: it is probable that the Battersea demands may amount to some two or three million units per annum, and, under the agreement, the cost per unit payable to the Fulham Council will be materially affected by the price of coal.

The Battersea B.C. having made satisfactory arrangements for coal supply for the next 12 months, anticipates that, in view of the supply of electricity in bulk, its coal contracts may exceed its requirements, and suggests that the Fulham Council should accept the transfer of 4,000 tons of coal at 20s. 7d. per ton.

Lowestoft.—**PRICE INCREASE.**—The T.C. has agreed to an increase of 10 per cent. in the charges for electric lighting and heating supply.

Middlesbrough.—The Corporation Finance Committee has ordered that no profits shall be taken from the electricity and gas undertakings in relief of rates, as owing to the L.G.B. refusal to sanction capital expenditure, it will be necessary to utilise profits for extensions during the ensuing year. The electricity department last year contributed £2,000 towards the relief of rates.

Newmarket.—**STREET LIGHTING.**—The Electricity Co. has refused the offer of the U.D.C. to pay £1 per lamp per annum for certain public lighting on account of restricted lighting, and has asked for £4 per lamp. The matter has been referred to a Committee.

Shaldon.—**E.L. SCHEME.**—The Teignmouth U.D.C. has informed Dr. J. Purves, with reference to the establishment forthwith of an E.L. installation at Shaldon, that, upon the work being completed, the Council is prepared to pay for public lighting by electricity at an agreed sum, but without any minimum payment as to restricted lighting.

Sheffield.—Amongst the "considerable items" of new capital expenditure by the Corporation, recently mentioned in the "Current Topics" column of the *Sheffield Daily Telegraph*, is £307,000 for electric power extensions. The electricity department's revenue for the year now closing is estimated at £277,000, or £150,000 more than in 1914. Seven years ago the receipts were only £77,000. The writer of the column proceeds to advocate an increase in the price of electricity, apparently with a view to the department emulating the tramways "as a popular reducer of the rates," and forgetful that cheap electricity may be achieving the same result in a less ostentatious manner.

Southport.—A large electric cooking installation has been fitted at the Southport station of the L. & Y. Railway.

St. Anne's.—The electrical engineer to the D.C. reported that the sale of energy for lighting and traction purposes in January showed a decrease, but the increase in the consumption for power purposes enabled the department to show an increasing total output.

Stafford.—For the purpose of extending the Corporation's electricity works, the Council has decided to purchase the adjoining land for £1,000, subject to the approval of the L.G.B.

Swansea.—**ELECTRIC COOKING.**—Subject to the approval of the Board of Education, the Education Committee proposes to install electric irons and a cookery stove at the domestic subjects centre. The Electricity Committee has instructed the engineer to make arrangements with the present contractors for the supply of coal to the electricity station for the continuance of their contract for a period of one month, and recommends that, in the meantime, tenders be invited for a supply for periods of three, six, nine, and 12 months respectively.

Torquay.—**LOAN SANCTION.**—The L.G.B. has informed the T.C. that it is prepared to sanction loans of £1,578, £3,518, and £3,550 for electricity purposes, and £3,252 on account of the new electricity plant.

U.S.A.—The Northern California Power Co. of San Francisco, like several other companies, has taken advantage of the present high price of aluminium to dispose of certain of its transmission lines, for which copper lines of increased capacity have been substituted. The proceeds of the aluminium wire taken down have been sufficient to cover the cost of copper wire of greater capacity together with the labour and other costs involved.

Walsall.—**MOTOR HIRING.**—The Electricity Committee of the T.C. has made arrangements with the British Thomson-Houston Co. to supply motors on the deferred payment system. The department will install the necessary wiring where such motors are supplied to consumers. Finding it difficult to obtain suitable men to fill the vacancies, the electrical engineer is applying to the War Office for the return of a shift engineer and sub-station attendant, who have enlisted.

Weybridge.—The Urban Electric Supply Co., Ltd., has applied to the U.D.C. for consent to erect overhead wires to supply a local works. The request has been referred to a Committee for consideration.

Whitehaven.—**NEW PLANT.**—Permission has been given for the manufacture for the Council of a 150-kw. generator; and the order is to be placed as soon as possible, and the cost met out of revenue.

Wigan.—We understand that Mr. S. L. Pearce, of Manchester, has informed the Corporation that he is unable, at the present time, to undertake the preparation of a report on the Council's electricity undertaking, as proposed by the T.C. and mentioned in these notes last week.

Wolverhampton.—**LOAN SANCTION.**—The L.G.B. has sanctioned the borrowing by the T.C. of £1,085, for laying mains to supply local firms.

The estimates for the year were recently considered by the T.C., when it was remarked that no contribution of profit from the electricity undertaking was included; Councillor Evans mentioned that a report on the subject was expected, and further intimated that the Council had a right to expect that arrangements would be made to ensure the customary dole to rate relief next year.

TRAMWAY and RAILWAY NOTES.

Accrington.—**TRAMWAY COLLISION.**—On Saturday two cars on the Clayton-le-Moors route came into collision in Whalley Road, Altham; both cars sustained damage, and the driver of one was seriously injured.

Bristol.—**TRAMWAY PURCHASE.**—At a meeting of the City Council last week, the Tramways Option Committee reported the result of its negotiations with the Tramways Co., as to what rent or other sum the company would be willing to pay and what concessions it would be willing to make to the Corporation if the latter agreed to refrain from exercising its option of purchasing the undertaking for seven, 14, or 21 years. The Committee states that the company is unwilling to make any payment in the nature of a wayleave, or to make such adequate concessions in the way of revision of fares or otherwise as in the Committee's opinion it would be justified in recommending the Council to accept in consideration of the Corporation refraining to exercise its option. Having regard to existing circumstances, the Committee is not prepared to make any recommendation at present on the main point, viz., the advisability of the purchase of the tramways. It, therefore, had come to the conclusion that until the time for advising the Council arrives, it should be authorised from time to time as and when necessary to apply to the Board of Trade for any further order extending the purchase period.

The City Council has decided to apply to the Board of Trade to postpone the date for the purchase of the tramways.

Bury.—**FEMALE LABOUR.**—For the first time locally, female conductors were at work last week on the Corporation cars.

Continental.—**ITALY.**—The Camera di Commercio, of Genoa, has approved of a scheme for the electrification of the Genoa to Orada Railway, at present worked by steam. The electrification is rendered necessary by the congestion of traffic from the Port of Genoa.

A motion has been presented in the Consiglio Provinciale, of Florence, declaring necessary the abolition of steam traction and the substitution thereof of electricity, on the railway lines Florence-Campi-Prato, Florence-Poggio a Caiano, and Casellina-Porto di mezzo, as soon as the Provincial Deputation shall judge the moment opportune, and in view of the circumstances connected with the war.

SPAIN.—The engineers entrusted with the surveys for the direct electric railway from Madrid to Valencia have completed their work with the exception of that relating to the Madrid terminus.

Dundee.—On the suggestion of the Corporation tramway manager, the Corporation electricity department, which controls the overhead equipment of the tramways, has fixed up an automatic trolley reverser at the foot of Reform Street, and should the device work successfully, it will be adopted on the other parts of the system.

Glasgow.—**FEMALE LABOUR.**—The tramways manager has reported verbally as to the results of the experiment of training as tramcar drivers, such of the women conductors as he considered suitable, and has been instructed to maintain the tramway service by the employment, if possible, of men as drivers, but if men cannot be obtained, then by the employment of women, on the same terms and conditions as the men.

London.—**B. OF T. TRAFFIC REPORT.**—A report on London traffic in 1915, by the B. of T., has been issued, which mentions that the results of the working of the L.C.C. tramways during the first four months of 1914-15 showed some improvement, which led to unjustified hopes of continued improvement. During 1914-15 the receipts amounted to £2,399,847, and working expenses to £1,700,571, leaving a surplus on working of £699,276, which, after deducting debt charges, left a deficiency of some £33,000. For the present year, 1915-16, it would appear probable that the general reserve fund will be absorbed by the deficit on revenue account, and may possibly fail to meet the whole deficiency. The strike of May last was estimated to result in a loss of £100,000, while increased wages and other expenditure will tend to add to abnormal costs.

The Highways Committee has considered the application of the Erith U.D.C. for a prov. order to run motor-buses through the borough of Woolwich, and, if necessary, representations are to be made to the L.G.B. with a view to securing contributions towards road maintenance and street improvements, and an undertaking not to oppose an application by the L.C.C. for powers to run 'buses or tramways in Erith.

Mossley.—At a meeting of the T.C., on March 9th, reference was made to the increasing cost of carting coal from the railways to the gasworks—one speaker said the increase was from £700 to £1,400—and the suggestion was made that the tramways should be utilised for the conveyance of coal. It was estimated that a saving of £500 a year could be effected, and the matter had been brought to the notice of the manager of the Joint Electricity and Tramways Board, and was receiving consideration.

Newcastle.—**ACCIDENT.**—On the evening of the 9th inst. a collision occurred on the Scotswood tramway route; a double-decked bogie car, heavily laden, was going up the Delaval Bank towards the city, followed by a single-decked car, when the former suddenly stopped and ran backwards into the following car, causing considerable damage, but no personal injury. It was stated that the current was accidentally cut off from the first car, and the brakes failed to hold the car on the bank, owing to the greasy condition of the rails.

ELECTRIC VEHICLE.—The Town Improvement and Streets Committee has decided to purchase an electrically-driven van for the collection of domestic refuse.

Oldham.—At a recent meeting of the Tramways Committee, Ald. Isherwood disposed of various statements to the effect that something was wrong with the finances of the department. The borough treasurer had investigated the matter, and found all in order; in justice to the late manager, and to the Committee, and to the general public, that report should be made public.

South-Western Electrification.—On Sunday last the electrical train service over the loop line *via* Hounslow was commenced, and a new station opened at Barnes Bridge. The service is half-hourly, with extra steam trains at business hours.

Swansea.—**TRAMWAYS SUPPLY.**—A draft agreement has been approved between the Swansea Tramways Co. and Corporation for the supply of the whole of the electrical energy for the working of the Swansea tramways. At present the Corporation supplies about one-fourth, and it is stated that the company is anxious to purchase the remainder of the current and proposed to scrap its present electricity station.

Walsall.—**YEAR'S WORKING.**—The working of the tramways undertaking during the past 12 months has resulted in a surplus of £7,846. Working expenses during the period under review amounted to £22,955, an average of 7'530d. per car-mile, as against 7'267d. in 1914. The total income was £40,291, £39,351 of this sum being traffic revenue, or an average of 12'908d. per car-mile as compared with 11'094d. in 1914. This leaves a balance carried to net revenue account of £17,336, where interest and rent of leased lines are added, bringing the amount up to £18,615. Against this total is set interest, income-tax, sinking fund, and allowances to men serving in H.M. Forces, leaving a sum of £7,846 for appropriation. To this has been added the surplus on the motor-bus undertaking (£928), making a total of £8,775, from which £2,000 will go in aid of the rates, £2,988 for the purchase of three additional 'buses, £899 for the purchase of a site for depot extension, and £515 for a temporary garage. From the balance a further £2,000 is to go in aid of the rates, and £300 for a motor parcel-van. The remaining £72 will be carried forward.

TELEGRAPH and TELEPHONE NOTES.

Guernsey.—The accounts of the Guernsey States Telephone Department, for the year 1915, show that the receipts were £7,511, and the expenses (including £864 interest on capital, and £724 Post Office royalty) £4,741; sinking and reserve funds absorbed £2,230, leaving a net surplus of £540. For 1914 the profit was £769. Subscribers' lines (including extensions) numbered 2,071, an increase of 33, and the mileage of metallic circuits, overhead and underground, was 2,584 miles. Subscribers' and public calls amounted to 1,690,492. The capital expenditure on land, buildings, and works amounted to £50,358 (including £18,358 drawn from the reserve funds), of which £3,632 has been repaid.

Wireless in the R.N.A.S.—Boy mechanics are immediately required for training as wireless telegraphists in the Royal Naval Air Service; age between 17 and 17½ in March, 1916. Service is for the period of the war only. Application should be made to the Wireless Officer, R.N.A.S. Depot, Barlby Road, North Kensington.—*The Times.*

Code Telegrams.—The Riverside Code, 5th Edition, has been added to the list of codes authorised for use in foreign telegrams. The code is not at present available for use in telegrams to the Argentine Republic, Brazil, Paraguay, Uruguay, and the Republic of Honduras.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—**SYDNEY.**—May 1st. Two 300-kw. turbo-alternators, condensers, switchboard, &c., for the pumping station at Ryde, for the Metropolitan Board of Water Supply and Sewerage at Sydney. *

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-kw. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney. *

Bristol.—March 24th. Unwashed small coal or washed pea coal for the Corporation electricity works. Mr. H. F. Proctor.

Dundalk.—March 21st. U.D.C. Engine-room stores, cables, lamps, &c., for the Electricity Department. See "Official Notices" February 25th.

Dundee.—March 29th. Corporation. Electrical stores, meters, &c. Electricity Department, Dadope Crescent Road.

Halifax.—March 23rd. Electrical fittings for six months, for the B. of G. Mr. A. T. Longbotham, Clerk, 4, Carlton Street.

London.—March 24th. H.M. Commissioners of Works. Main switches, main fuses, switch fuses and fuseboards, for one year. See "Official Notices" to-day.

Manchester.—March 22nd. Electricity Committee. 6,600-volt three-phase switchgear, for Stuart Street station. See "Official Notices" March 10th.

New Zealand.—**DUNEDIN.**—May 17th. City Council. (1) Tramcar bodies; (2) electrical equipment. Plans, &c., from the Town Clerk, Dunedin. *

WANGANUI.—May 9th. Borough Council. Gas producer plant, gas engine, generator and switchgear. *

Rathmines.—March 27th. U.D.C. Cable, house-service and fuse boxes, and meters, for 12 months. See "Official Notices" to-day.

Redditch.—March 28th. U.D.C. Three and six months' supply of coal for the Electricity Department (125 tons of D.S. nuts per week). See "Official Notices" to-day.

Spain.—March 27th. The municipal authorities of San Ildefonso (Province of Segovia). Tenders for the concession for the electric lighting of the town during a period of two years.

Warrington.—March 21st. Electrical goods (not of German or Austrian origin) for six months, for the B. of G. Mr. A. Bottomley, Clerk, Bewsey Chambers.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Bradford.—The Tramways Committee has accepted the offer of the Dunlop Rubber Co. for rubber tires for railless trolley cars for two years from February, 1916, at 75d. per mile run per vehicle and that of the National Rail and Tramway Appliance Co. for brake blocks at an increase of 5 per cent. on the present contract.

Colchester.—T.C. :—

Electrical equipment of tramcars (for three months).—Mr. G. W. Allsop and P. R. Jackson & Co.
Overhead equipment (for three months).—B.I. & Helsby Cables, Ltd.
Rubber and fibre (for three months).—L. Andrews & Co.
Castings (for three months).—Stanford & Co.
Car fittings (for three months).—British Hele-Shaw Co. and Stanford & Co.
Oils and grease (for a year).—Williams & Co.

Glasgow.—The Tramway Works and Stores Committee recommends acceptance of the following tenders :—

Galvanised-steel wires.—J. Stewart & Co.
9/13 cab-wire cable.—St. Helens Cable Co.
Three-core cable.—B.I. & Helsby Cables, Ltd.

The Electricity Committee has accepted tenders for (1) air filters required in connection with the new turbo-alternators for the Port-Dundas and the St. Andrew's Cross generating stations, and (2) fans for the cooling towers at the St. Andrew's Cross station, as follows :—

Air filters.—Davidson & Co., Ltd., £562.
Fans.—Matthews & Yates, £727.

London.—**FULHAM.**—The Electricity Committee recommends the acceptance of the tender of Messrs. Cory Bros. for the supply of 100 tons per week for six months of small Aberclyde Welsh coal, at 23s. 6d. per ton, and of the Battersea B.C. offer of 4,000 tons Pooley Hall small nuts, at 20s. 7d. per ton at Chelsea Basin, plus 1s. 2d. per ton for delivery alongside of the Council's wharf.

HAMMERSMITH.—The Electricity Committee has received the following tenders for annual supplies:—

BOX FRAMES, COVER, BOXES, &c.	
W. Lucy & Co., Ltd.	(recommended) £446
Johnson & Phillips	585
R. L. & Helsby Cables, Ltd.	774
Siemens Bros. & Co., Ltd.	807

INSULATING BOX FILLING (COMPOUND). Per cwt.	
Dussek Bitumen Co.	(recommended) £0 17 0
L. Andrews & Co.	1 0 0
Limmer Asphaltic Paving Co., Ltd.	1 0 0
Premier Bituminous & Asphaltic Co., Ltd.	1 5 0
Siemens Bros. & Co., Ltd.	1 5 6
Johnson & Phillips, Ltd.	1 10 0
R. L. & Helsby Cables, Ltd.	2 8 8
Callender's Cable & Construction Co., Ltd.	2 12 6

INSULATED WIRES.	
General Electric Co., Ltd.	(recommended) £175
Pirelli, Ltd.	175
Gillespie & Beales	195
Liverpool Electric Cable Co., Ltd.	200
A. F. Goodwin & Co.	219
Henley's Telegraph Works Co., Ltd.	219
B. L. & Helsby Cables, Ltd.	231
Siemens Bros. & Co., Ltd.	232
Johnson & Phillips, Ltd.	232
Callender's Cable & Construction Co., Ltd.	232
W. T. Glover & Co., Ltd.	232

The Committee recommended the acceptance of the following tenders:—

Steam packing and jointing materials.—Middleton Bros.
Fire bricks, clay and lime.—Albion Clay Co., Ltd.
Electrical accessories.—Baxter & Gaudier, Ltd.

Swansea.—Electric lighting of two new elementary day schools—Brynmill and Cwmburla. The tender of Mr. J. W. Law, the lowest in each case, was accepted by the E.C., at £168 and £410 respectively.

Whitehaven.—Council. For a year:—

Cylinder and crank-chamber oil.—Vacuum Oil Co., Ltd.
Tapes.—W. T. Henley's Telegraph Works Co., Ltd.
Bitumen.—Dussek Bitumen Co.

Wolverhampton.—The Electricity Committee recommends the acceptance of the tender of Messrs. Brace Peebles and Co., Ltd., for a 750-KW. converter.

FORTHCOMING EVENTS.

Institution of Mechanical Engineers.—Friday, March 17th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. Paper on "The Composition of the Exhaust from Liquid-fuel Engines," by Second-Lieut. R. W. Penning, R.E. (D).

Greenock Electrical Society.—Friday, March 17th. At 7.45 p.m. At the Temperance Institute, 19, West Stewart Street. Papers on "Some New Diagrams of Connections," by Mr. D. Angus, and "Heating and Ventilation," by Mr. W. A. Toppin.

Friday, March 24th. At the Temperance Institute, 19, West Stewart Street. General meeting.

Electro-Harmonic Society.—Friday, March 17th. At 8 p.m. At Holborn Restaurant. Smoking concert.

Royal Institution of Great Britain.—Saturdays, March 18th and 25th. At 3 p.m. At Albemarle Street, W. Lectures (II and III) on "Radiations from Atoms and Electrons," by Prof. Sir J. J. Thomson.

Thursday, March 23rd. At 3 p.m. At Albemarle Street, W. Lecture (II) on "Organic Chemistry in War: Organic Products used as Propulsive and Explosive Agents," by Prof. H. E. Armstrong, F.R.S.

Institution of Electrical Engineers (Manchester Local Section).—Tuesday, March 21st. At 7.30 p.m. At the Engineers' Club, 17, Albert Square. Paper on "The use of Continuous Current for Terminal and Trunk Line Electrification," by Mr. N. W. Sizer.

Illuminating Engineering Society.—Tuesday, March 21st. At 5 p.m. At the Royal Society of Arts, 12, John Street, Adelphi. Discussion on "Some Aspects of the Design and Use of Glassware in relation to Natural and Artificial Illumination."

North-East Coast Institution of Engineers and Shipbuilders.—Friday, March 24th. At 7.30 p.m. At Bolbec Hall, Newcastle-on-Tyne. General meeting.

Physical Society of London.—Friday, March 24th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. General meeting.

Manchester Association of Engineers.—Saturday, March 25th. At the Grand Hotel, Ayton Street. Report of the Tool Steel Research Committee.

NOTES.

Electro-Harmonic Society.—The last smoking concert of the present season will be held at the Holborn Restaurant (King's Hall), to-night, Friday, commencing at 8 p.m.; Mr. J. H. Rider will be in the chair. The artistes will be as follows:—Mr. Maurice D'Oisley, tenor; Mr. Edward Beaumont, baritone; Mr. Fraser Gange, bass-baritone; Mr. Joseph Ball, banjoist; Mr. Foden Williams, humorist; Mr. Allan Stainer, conjuror and ventriloquist; Mr. Thornley Dodge, entertainer; and Mr. Bernard Flanders, A.R.A.M., solo pianoforte and accompanist.

Work Wanted.—The repair staff of Taunton electricity works wants to fill in spare time with lathe, drilling machine or vice work. An announcement on the matter appears among our advertisements to-day.

Inquiries.—Makers of zinc cases for dry cells, and of insulating links for use in tumbler switches, are asked for.

Committal Order.—In the King's Bench Division, before Mr. Justice Horridge, Mr. Barton-Wright, of the Barbitus Institute, Oxford Street, appeared to show cause why an order for committal should not be made against him for having failed to obey an order of Mr. Justice Scrutton, made in January last, directing him to pay £12 a month in liquidation of the amount of a judgment obtained against him by Mrs. Beattie, a patient.

His Lordship made an order for committal, but directed that it should not issue if Mr. Barton-Wright paid £6 in a fortnight and the balance in a month.

Institution and Lecture Notes.—Institution of Electrical Engineers.—At a largely attended general meeting of the DUBLIN LOCAL SECTION, at the Royal College of Science, Dublin, on Friday last, the following resolutions were passed:—

1. That this meeting is of opinion that the membership of this Institution of any citizen, born of alien enemy parentage, naturalised or not naturalised, shall forthwith cease, and that after the termination of the war no such citizen shall be eligible for membership; and further, that any citizen of the Empire or allied or neutral nations, being a member of any grade of the Institution, who becomes an agent for a firm owned or controlled by citizens of those enemy nations shall automatically cease to be a member.

2. That the chairman, hon. secretary and another be deputed to attend the general meeting to be held in London to support the terms of the foregoing resolution.

At the meeting of the SCOTCH LOCAL SECTION at Glasgow, on Tuesday last, Dr. Charles Chree delivered his Kelvin lecture on "Terrestrial Magnetism."

At a meeting of the NEWCASTLE LOCAL SECTION, on Monday, Mr. J. S. Peck read an abstract of a paper by Mr. N. W. Storer, on "The Use of Continuous Current for Terminal and Trunk-Line Electrification."

Birmingham and District Electric Club.—A "ladies' night" was held on Saturday, when a lecture was delivered by the President (Mr. W. G. L. Riddle) on "Impressions of China and the Chinese." A musical programme followed.

Croydon Wireless Society.—At the meeting on March 4th, Mr. E. H. Pollett, B.Sc., gave a lecture and demonstration on electric welding.

Engineering and Scientific Association of Ireland.—"Small Electric Stations" was the subject of a lecture delivered by Mr. L. J. Lawless last Monday at a meeting of the Association. Various small electric schemes in Ireland were described, and it was shown that whether they were operated in competition with, or in substitution for, gas they proved profitable.

"Lest We Forget."—The report of Lieut.-Col. Von Donop, the Board of Trade Inspector, on the disaster near St. Bede's Junction, on the North-Eastern Railway, on December 17th, 1915, was issued last week. The Inspector says:—"This accident is one which the provision of track circuit, which is now being so largely adopted by railway companies, would undoubtedly have prevented." He adds that the evidence that the fire which consumed the wreckage originated with gas is more definite than in any previous case, and furnishes a very conclusive object lesson as to the additional danger which is caused in the case of an accident by the presence of gas on the train. After each of the Hawes Junction, Ditton, and Aisgill accidents, the Board of Trade specially communicated with all the companies on the desirability of electricity as an illuminant in preference to gas. On December 31st, out of a total number of 4,241 coaches owned or maintained by the North-Eastern Railway, 626 were lighted by electricity. But the company has not undertaken, as several other companies have done, that all their new stock shall be so fitted, nor have any steps been taken by them towards the conversion of the existing gas-lit stock.

The Inspector expresses the hope that this fire may lead the company to the adoption of a definite decision in favour of electric lighting for all new stock, and for the gradual conversion of the gas-lit stock.

Electric Cooking Development in a Small Town.

—A recent issue of the *Electrical World* contained some details of the method adopted for introducing electric cooking at Glendive, Mont., which has a population of 4,000. In view of the increased revenue if electric cooking were adopted, it was considered worth while to offer ranges at cost to induce consumers to try them. It was further decided to furnish wiring free, putting in stoves on a 30 days' free trial, but with a charge of \$4 in case the consumer returned the stove. The charge for energy is 4 cents per kw.-hour, with a dollar minimum charge per month, and no meter is installed until the end of the trial period, because experience shows that the first month's bill being the largest will tend to prejudice the consumer against electric cooking. It is found that the average consumption per month per range is 100 kw.-hours. In a few months 60 ranges were sold on this basis, and it is hoped to have 150 in use before 1917. It is also noted that the peak load increase has been small—not over 25 kw.

Waste Copper Recovery by Electricity in Russia.

—The All-Russia Town and Communal Union is organising a factory for using waste copper. Statements have been prepared of the stocks of waste copper on the railways and in the Government works, and shortly, says a Petrograd paper, work will be begun on the recovery of such copper by the use of electricity.

The Metric System.—The annual report of the Chief Inspector of Weights and Measures shows that last year the number of metric weights and measures verified in Whitecross Street was no less than 33,000, whereas in 1914 the total stood at only 1,741.

Waste of Coal.—Last week Prof. W. A. Bone, Professor of Chemical Technology at the Imperial College of Science, delivered an address on the subject of economy in the consumption of fuel to the members of the Society of Chemical Industry. He stated that the coal which was left behind in the pits represented about 25 per cent. of the coal raised, and the question of checking this wastage was one of supreme national importance. By the reimposition of the duty of 1s. a ton on all coal exported from this country a revenue of about £5,000,000 would be produced, which might be earmarked by the Government for investigation of the problem of coal fuel economy. The waste in the domestic consumption of coal was notorious, and it was the duty of the leaders of science in this country, in the interests of the nation, to see that the Government should not be allowed any longer to overlook a matter of such vital importance. By the elimination of wasteful processes in iron and steel works and rolling mills, a saving of about two-thirds of the fuel consumption might be effected, and the present unsatisfactory situation in the coking industry should be remedied.

Volunteer Notes.—**ENGINEERING INSTITUTIONS' V.E.C.**—Orders for week commencing March 20th, 1916.—By Lieut.-Col. C. B. Clay, V.D., Commanding.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Monday, March 20th.—Sections 1 and 2, Technical; Sections 3 and 4, Lashings and Trestle Bridging, Signalling Class and Recruits.

Tuesday, March 21st.—School of Arms, 6 to 7 p.m.

Wednesday, March 22nd.—Shooting for Sections 1 and 2, and Signalling Class.

Thursday, March 23rd.—Sections 3 and 4, Technical; Sections 1 and 2, Lashings and Trestle Bridging; Signalling Class and Recruits.

Friday, March 24th.—Uniform Parade at 2.45 p.m.

Attendance is specially desired for all Members on Saturday, March 25th, as it is proposed to hold Battalion Drill.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, March 16th, 1916:—

Battalion Parades.—Saturday, 18th inst.—The Battalion will parade, as strong as possible, outside Putney Bridge Station, at 3 p.m., and proceed by march route through Richmond Park, and back to Putney Bridge Station, dismissing about 5.30 p.m.

Dress.—Marching Order. Members may use their own discretion as to what they carry in their rucksacks, but the total weight of the articles carried must not be less than 20 lb. "Derby" Recruits are invited to attend.

Sunday, 19th inst.—The Battalion will parade, as strong as possible, at Liverpool Street Station (low-level entrance, G.E.R.) at 9.30 a.m., and proceed by train for Entrenching duties. Members will carry their own lunch. The Battalion will return to town about 6 p.m.

Musketry.—Acton Range will be open for shooting on Saturday, the 18th inst. Members desirous of shooting must send in their names to the Musketry Staff. Parade in uniform punctually at 2 p.m. Members are requested to bring their own ammunition, if possible.

There will also be shooting at Bisleigh. Members should report themselves to Sergeant Cotter, at the barrier of No. 6 Platform, at 12.45 p.m., on Saturday night, the 18th inst.

A. G. JOINER, Major and Adjutant, O.B.C.

Electricity at the Front.—An article in *L'Industrie Electrique*, quoting from the *Elek. Anzeiger*, states that the territory in Belgium and France which is occupied by the enemy is very rich in factories, with a great many central stations supplying electric light and power. In the villages even the poorest houses are provided with the electric light. Many manufacturers have been damaged or completely destroyed by artillery fire, but, with much labour and skill, some of them have been repaired and set in operation again. The high-pressure mains, the transformer stations, and distributing networks have suffered still more than the works from the effects of the fighting, but as soon as possible after the district is occupied the mains are put in order, and the electric light is brought into use, a very important matter, in view of the scarcity and high price of oil and candles. As there were stocks of coal at the pit-heads, and the pits that were in good condition have been restarted by the Germans, energy is generated at very cheap rates. Even before the large power stations had been restored, ingenious soldiers had brought many small installations into use for lighting houses, and the electric light is almost indispensable for hospitals, operating theatres and dressing rooms, bakeries, railway stations, and offices.

With the aid of electric power the Germans have been able to thrash quickly considerable quantities of corn, to drive their workshops, and to carry on a variety of important services. As coal

cannot be used at the mines in the neighbourhood of hostile artillery for fear of attracting attention by the smoke, winding engines have been driven by electric power. In the stables chaff-cutters have been driven by motors, and the dentists in rear of the front use motors to ply their art. In some cases, places which before the war were not electrically lighted have been provided with installations.

The use of electricity at the extreme front line is particularly important. In spite of the difficulty of laying mains to the firing line, electric pumps are often used to clear the trenches of water; electricity has also proved most useful in tunnelling for mines quickly and silently, a matter of great importance, besides making it possible to ventilate long and narrow underground galleries. Electric light is also used in the trenches and dug-outs. It is stated, in illustration of the wide use of electricity, that in 22 localities about 4,500 lamps have been installed, as well as 105 motors, of a total of 450 H.P.

Our French contemporary adds the amusing comment that the German journal did not mention (what it knew) that on restarting the power station at Lille, at the commencement of the German occupation, the electricians in charge took three months to find out that they were supplying free light and power to certain towns which were still in the hands of the allied armies, by way of the underground cables which connected the station with various substations. Thus, for example, the British at Armentières for that period obtained their electric light from the Germans. And many other interesting matters will be revealed by *L'Industrie*—after the war.

Electric Vehicle Association of America.—A special meeting of this Association was to be held last week, with a view to members voting on the proposal that the Association should be affiliated with the National Electric Light Association, as its Electric Vehicle Section. Under this arrangement the E.V.A. annual convention would become one of the N.E.L.A. section sessions.

Trade with Spain after the War.—According to information furnished by H.M. Consul at Bilbao, local business men anticipate that after the war there will be a rush of Germans to Spain intent on doing business in, and trading with, that country. German firms will be less disliked in Spain than they are in countries with which Germany is at war, and they will, doubtless, be eager to regain and make the most of their Spanish business connections. Before the war Spain was flooded with cheap German goods, and it is reported that 75 per cent. of the machinery, tools, electrical fittings, &c., in use in Bilbao is of German manufacture. Many of these goods are highly finished, but very poor in quality; nevertheless, they are preferred by the Spanish purchaser on account of their cheapness. The present is, however, considered a good moment for introducing United Kingdom manufactures. H.M. Consul, therefore, suggests to United Kingdom firms, if they wish to preserve their position in Spain, they should consolidate their connections and clientele, so as to be able to compete against the expected German business effort. Large numbers of Germans are now in Spain employed in obtaining information on every kind of subject.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—After a very lengthy discussion, the Blackburn Council has approved of a recommendation of the Electricity and Tramways Committee to increase the salary of Mr. P. P. WHEELWRIGHT, the electrical engineer, from £700 to £800. An amendment referring the matter back was defeated by 25 votes to 22.

The Bristol Electrical Committee reports having considered the desirability of granting Mr. ROBT. PARKER, foreman of the generating station, a gratuity in respect of his long service, but is unable to agree as to the making of any grant.

The Swansea Corporation Electricity Committee has decided that Mr. H. A. DAVIES, of the public lighting section, be placed in charge of the new publicity department, and that he be raised to Scale "B" in the salary scale.

The Dublin Corporation, by 36 votes to 9, adopted a report of the Electricity Supply Committee recommending an improvement in the scale of remuneration of the meter readers; and that Mr. WM. DILLON, of the accountant's section of the and that Mr. WM. DILLON, of the accountant's section of the secretarial staff, be appointed a first-class officer.

General.—On the 6th inst., at the Woolwich Works of Messrs. Siemens Bros. & Co., Ltd., was celebrated the completion of 50 years' service in the employment of the company by Mr. ROBERT BERTRAM, of the dispatching and receiving department. Mr. Alexander Siemens congratulated Mr. Bertram on having attained his jubilee of service, during which

time he had seen the business grow from a very small beginning, when about 50 persons comprised the whole staff, to the present time, when the number of the employees is about 4,000. He had the pleasure of presenting him with an illuminated address and a cheque from his colleagues at the works, as a token of their esteem and regard, and also a cheque on behalf of the company as a recognition of his faithful service and the manner in which his duties had always been performed. Mr. Bertram, in reply, thanked the company through Mr. Siemens, and also his colleagues, most of whom were present, for their gifts and the expression of their goodwill, and referred to some of his very early experiences when the neighbourhood of the works was still rural.

Sir George GREENHILL, F.R.S., and Mr. CHARLES BRIGLI, F.R.S.E., M.Inst.C.E., have requested that their names be withdrawn from the executive committee of the Aeronautical Institute.

Mr. W. A. SCOTT, works manager of Messrs. Bruce Peebles and Co., Ltd., Edinburgh, was married on 9th inst. to Alexandra, second daughter of Alexander Mann, Edinburgh. A few days prior to the wedding Mr. Scott was presented with a canteen of cutlery and a silver cigarette case by the workmen and staff.

The marriage took place at St. Robert's Catholic Church, Harrogate, on March 4th, of Mr. A. C. COOPER, electrical engineer, of Manchester, and Miss Muriel Margaret Seamer.

Roll of Honour.—The *Times* records that Second-Lieutenant H. A. JOHNSTON, of the Royal Flying Corps, was killed in France on March 4th, aged 21. Before volunteering as a private he was with Messrs. Siemens Bros., and had fitted wireless installations in many parts of the world.

Obituary.—Mr. C. W. FAIRWEATHER.—We regret to record the death of Mr. C. W. Fairweather, consulting engineer, of Newcastle-upon-Tyne, who was one of the founders and managers of the Northern Counties Electric Supply Co., which, after a very successful career, was absorbed by the Newcastle-upon-Tyne Electric Supply Co. Mr. Fairweather was well known in engineering and electrical circles, and in later years carried on an extensive consulting practice in connection with mining and collieries. His death will be deplored by a very wide circle of friends.

Mr. B. SHORT.—Mr. Bert Short, who was for six years chief clerk and cashier at the North Metropolitan Electric Supply Co.'s undertaking at St. Albans, passed away on March 4th, after an operation at St. Bartholomew's Hospital.

NEW COMPANIES REGISTERED.

New Era Signs (U.S.A.), 1916, Ltd. (142,233).—This company was registered on March 8th, with a capital of £200 in 100 shares, to acquire and develop the patent rights in the U.S.A. of an invention for improvements in or relating to flashlight advertising devices, to carry on the business of manufacturers of and dealers in advertising apparatus for displaying electric and other advertisements, dynamos, lamps, wires, cables, insulating materials, accumulators, telephone and other apparatus, &c., and to adopt an agreement with E. C. Leachman and the Magna Charta Publishing Co., Ltd. The subscribers (with one share each) are: E. C. Leachman, 9, Oakley Street, Chelsea, S.W., advertising expert; T. C. Elliot-Lawson, 55, Cleveland Square, W., company director, private company. The number of directors is not to be more than two or more than seven; the first are T. C. Elliot-Lawson, F. Hope-Jones, E. C. Leachman, and C. H. R. Profumo. Registered office: Allion House, 59-61, New Oxford Street, W.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Lancashire Light Railways Co., Ltd.—A memorandum of satisfaction in full on June 30th, 1915, of a mortgage of charge dated June 29th, 1907, securing £3,000, and a mortgage of charge dated January 1908, having a transfer of the said mortgage, enclosures, and a further charge securing £3,000, has been filed.

Reid Brothers Engineers, Ltd.—Particulars of £3,000 debentures, created February 15th, 1916, 60d pursuant to Section 83 (3) of the Companies (Consolidation) Act, 1908, in which amount loan has been issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Faringdon Electric Light and Power Co., Ltd.—Issue on May 15th, 1914, of £300 in collateral security with bankers for loan, and on February 11th, 1916, of £1,100 debentures, part of a series of which particulars have already been filed.

Bourton-on-the-Water Electric Light and Power Co., Ltd.—Issues on various dates from October 15th, 1913, to February 11th, 1916, of £250 debentures, part of a series of which particulars have already been filed.

CITY NOTES.

County of London
Electric Supply
Co., Ltd.

Mr. H. B. RENWICK presided at the annual meeting, held on Monday. He said that the gross receipts had grown by 9 per cent. to £286,259, but the costs and expenses had increased by £28,592, or 20.5 per cent., and the net revenue was £159,659, as compared with £164,043 for 1914. Increased costs due to the war occurred in the items for coal and other fuel, salaries

and wages, rates and taxes, and insurance. Had it not been for war burdens, the company would have had a record year in all respects. Coal had been about 50 per cent. above the 1914 prices. Their normal supplies were sea-borne, and the cost of freightage alone was now more than the cost in pre-war times of the coal itself delivered into the bunkers. They still had difficulty in maintaining proper stocks of coal. It was true some public action was taken to deal with the matter on lines similar to the recent Act determining the maximum price of coal at the pit's mouth or by constituting a Board of Control with similar duties to those of the Railway Executive Committee which was now doing such good work in regulating the traffic of the British railways. There was a general increase in practically everything purchased during the year. The gross effect of their war burdens was to more than nullify the very excellent increase in the gross receipts. In order partially to recoup the company for these additional expenses, the charges to consumers had been advanced by 10 per cent. In the capital expenditure of the year (£50,105), £31,745 represented expenditure on mains, which included the outlay necessary to give supply in bulk to the districts of Sutton, Carshalton, Wallington, and Chess, and in the district under the Romford Order. In regard to growth of business, the position was more than gratifying. The number of units sold increased by 2,549,340, and the consumers were 25,913, against 21,212. The continued expansion during war, in face of lighting restrictions and other adverse influences, was a striking testimony to the vitality of the company's business and to the potentialities of its areas of supply. It also spoke well for their commercial and business-getting staff, who had secured that large increase although working with a depleted staff and under adverse circumstances. They had also secured during the year two long-term contracts for supply in bulk—one with the South Metropolitan Electric Tramways & Lighting Co. in respect of their Sutton districts, and the other with a company in respect of Banstead, Chipstead, and Walton-on-the-Hill. Supply had already been commenced in the Sutton districts, but in the other cases operations would probably be deferred until after the war. These contracts had a significance and importance far beyond their revenue-producing value, seeing that they carried matters a step further in the direction of unification of supply, and they were in keeping with the company's policy of linking-up and centralisation. They adopted that policy at the commencement of operations 22 years ago, and after years of labour that policy was being vindicated more and more as time proceeded. A further result of these contracts was that there was now one generating station less in the London district for the Sutton station was being scrapped, and the necessity was avoided of erecting a further station which would otherwise have been required for the Banstead district. They were quietly doing what they could toward solving the bigger question of the London electricity supply problem. During the year they commenced supply in Romford. They now served a total area of about 223 square miles, of which about 181 were distributing and about 40 bulk supply. After alluding to the Bourne-mouth and Cambridge associated companies, Mr. Renwick said that the South London Electric Supply Co., in which they had a large share interest, had well maintained its position. The County Co. and its associated companies had 391 men on active service. In regard to the prospects, applications received to the end of February amounted to an additional 1,125 k.w., which exceeded the previous year's figures; the units output was up by 10 per cent., and there were 60 per cent. more new consumers. So far as new business was concerned, therefore, they could look forward with some measure of confidence, but they must expect further increases in station costs and other burdens in the way of war taxes. The chairman concluded by referring to the special services rendered by Mr. C. P. Sparks, the engineer-in-chief, in connection with the coal and other difficulties, and by Mr. F. C. McQuown, the secretary, to whom the period had been one of unusual strain.

Pará Electric Railways & Lighting Co., Ltd.

The annual meeting was held on February 28th, Mr. FOLLETT HOLT presiding. The chairman said they had suffered from a reduction in gross receipts, resulting from the continuance of the financial crisis in Brazil; measured in sterling, with exchange at 16d., the loss in receipts amounted to £95,168, or only 24 per cent. on the previous year's figures, the principal cause being a decrease of 357,000 in the number of tramway passengers carried. This reduction had been met by a reduction of 13 per cent., or over £174,000, in working expenses, by employing wood fuel in place of imported coal for power production, and by a very strict supervision of all items of expenditure. The fall in exchange during the past year had not only swallowed up their increased earnings of over £10,000, but a further £23,000 besides. After placing £15,000 to reserve, which now reached the substantial sum of £95,545, they were able to pay a dividend of 5 per cent. on the ordinary shares. During the year arrangements for taking over the whole of the share capital of the Pará Gas Co., Ltd., were completed. They were now engaged in developing the sale of gas for cooking and industrial heating. Their prosperity depended to a great extent upon the amount of rubber collected on the Amazon and upon its export value, and 33,500 tons of rubber were exported between July, 1914, and June, 1915, at a price 25 per cent. better than last year; they need not be disturbed at present about the future of the trade of Pará.—*Financial Times*.

Kensington & Knightsbridge Electric Lighting Co., Ltd.

At the annual meeting, on March 2nd, Col. R. E. CROMPTON, who presided, said there had been still more stringent reductions in lighting, and private economies, which had resulted in a further reduction of 9 per cent. in the output. The total reduction for the two years 1914 and 1915 amounted to nearly 1,000,000 units. Against this the average price received per unit had only increased by 2 per cent. Owing to the rapid rise in the price of Welsh coal, the company's local works were closed, and the whole of the supply was taken from the Wood Lane works. A saving of about 15 per cent. had been made on repairs to plant, and the total working expenses had been cut down from £51,523 last year to £48,852 this year. The present value of the plant, not taking any credit for the increase in the value of the copper in the mains, was in excess of the value at which it stood in the books, and under the circumstances, as a temporary measure during the period of the war, the balance of the amount placed to the credit of the renewal fund had been reduced from £9,745 to £7,261. The total renewal fund credit stood at £139,021. The directors had contested the quinquennial assessment of the property by the Borough authorities of Westminster and Kensington, and had been successful in obtaining a considerable reduction. About one-quarter of the staff and workmen had joined H.M. Forces, and several others would have to join later. The total sum for rates and taxes paid during the past year had been increased by £816. The reduction of dividend had been smaller than that of other companies, although they had only increased their price by 2 per cent. to the public. The use of electricity for heating and cooking was steadily increasing. The chairman called the attention of the shareholders to the devoted work of Mr. Miller, who was not only the engineer, but performed the duties of managing director and had supreme charge of the Wood Lane works; the excellent position in which the company stood was due to him. Replying to questions, he stated that he personally had found that it was a great economy to use electric heaters instead of fires, and the MANAGING DIRECTOR said they had had in the past year the largest increase in heating that they had ever had.

Oxford Electric Co., Ltd.

The annual meeting was held on Tuesday last week; Sir HENRY MANCE occupied the chair, and the SECRETARY read a memorandum stating that the revenue account showed a profit (including £1,055 brought forward) of £13,340. After providing £2,016 for debenture and other interest, also writing off £686 on account of hire-purchase installations, the balance available was £10,639. Renewals to the Diesel engine cost nearly £600, services to new customers £753, extensions of mains £483, meters £338. They had written off from the capital account a sum of £2,465, and had received during the year the sum of £5,000, being the first issue of 1,000 shares of the new preference capital created in 1914. The expenditure upon fuel had exceeded that of the previous year by over £800. Sales by meter showed a reduction of £1,184, and the revenue from street lighting was also less. The reserve and renewal of plant account, with the addition of the sum of £1,000 proposed to be now appropriated, would amount to £20,757. The chairman said that the expenditure on hire-purchase installations would be temporarily suspended. Of the clerical staff, four out of five were now serving with the Colours, and of the engineering staff, three members were called upon to serve at the commencement of the war, and 13 others joined shortly afterwards.

City of London Electric Lighting Co., Ltd.

The capital expenditure during 1915 was £25,952. The amount written off in respect of buildings, plant, and other works dismantled during 1915 is £30,738. Enforced reduction of lighting, and increased coal and production costs have prejudiced the annual profit. The total revenue was £311,820. After deducting expenses of generation and distribution repairs and maintenance, street lighting expenses, rent, rates, taxes, &c., amounting together to £161,000, £150,760 remains, plus £23,372 brought forward. Interest on loan, consumers' deposits, debenture interest, and other charges are deducted, and £50,000 is transferred to reserve, leaving £87,770. After paying 6 per cent. on the preference shares and 8 per cent. on the ordinary, as against 9 per cent. for 1914, £18,024 remains to be carried forward. The gross revenue was (as above) £311,820, as compared with £306,034 in 1914 (increase £5,785). The net revenue was £150,759, as against £164,464, a decrease of £13,705. The average price obtained per unit was 2.27d., as against 2.26d. in 1914. The consumers connected decreased by 370 to 11,720, and the kW. connected (including power and heating) increased by 629 kW. to 46,161 kW. The reduction in number of consumers is entirely due to war conditions causing the suspension of many businesses, notably among stockbrokers and foreign importing agents. The units generated increased from 33,906,963 to 34,643,297; and the number sold from 29,182,165 to 29,479,079; the maximum supply demanded decreased from 19,739 kW. to 17,424 kW. The units sold increased by 296,914, notwithstanding that the consumption for lighting purposes was more than a million units less. Power and heating supplies continue to show a steady increase; in 1915, 12,375,577

units were sold for power and 2,844,636 for heating, together being equal to 53 per cent. of the total units sold for private supply. 168 members of the staff are serving with the Forces. Four have been killed and nine wounded. Liberal allowances have been made to all, to ensure that no financial hardship shall be suffered, and all who return will be re-instated after the war. The Marquess of Winchester, one of the directors, is now serving in France. Annual meeting: March 22nd.

Newcastle-upon-Tyne Electric Supply Co., Ltd.

The connections to the system during 1915 were increased by 26,965 H.P., making 258,390 H.P. total. The profit for the year was £204,418, as compared with £178,380, plus £5,946 brought forward. Interest and debenture stocks, loans, &c., amounted to £58,696, leaving £151,669. After paying 5 per cent. on the preference and 6 per cent. on the ordinary shares, as compared to 5½ per cent. for 1914, placing £25,000 to depreciation reserve (as compared with £20,000), and £28,000 to general reserve (as compared with £17,000), £5,191 remains to be carried forward. £23,965 has been spent out of revenue on the efficient maintenance of the plant and system generally. £110,079 spent on capital account during the year represents further cost of extensions in progress at the Carville and Dunston power stations, and to the general distribution system. The nominal value of the shares held in the County of Durham Electrical Power Distribution Co., Ltd., has been adjusted to correspond with the reduced share capital of that company. Mr. R. P. SLENN has been elected to the board, but he retains his position as manager. At Dr. J. T. Merz's wish he has relinquished the position of chairman, and Mr. J. H. ARMSTRONG has been elected to act in his place. Dr. Merz becomes vice-chairman. Annual meeting: March 21st.

Waste Heat and Gas Electrical Generating Stations, Ltd.

Mr. R. S. NEWALL presided at the annual meeting on March 8th in the absence of Dr. J. B. SIMPSON, whose speech he read. The capital expenditure had been increased by £3,654. The expenditure incurred was almost entirely in connection with the extensions at Weardale and Grangtown power stations. The new plant was being installed at Weardale with a view to a more efficient use of the gas received from the coke ovens, and the further plant at Grangtown was being put in with a view of maintaining a greater and more continuous output. Although the manufacture of the plant and the completion of the works must necessarily be slower than in normal times, there was a good prospect that all the plant would be brought into operation during the current year. These extensions would cost about £45,000. In June, 1915, the company had been allotted £10,000 of the 4½ per cent. War Loan, and the whole had been paid up. The general reserve and depreciation account had been increased by £11,000, together with £6,573 added for redemption funds in respect of plant supplied on hire-purchase terms. He had been asked by more than one shareholder whether they made proper reserves against possible industrial developments which might tend to supersede the methods they employed in the utilisation of waste heat and gas. He thought the accounts presented to them each year, and the explanations he had given at their meetings, showed that their reserves were ample; in fact, they made such reserves as would provide for the whole cost of their installations over the period for which they had contracted to receive the supplies of waste heat. The possibility of utilising waste heat in a more efficient way also received their continual consideration, and he had already referred to the new plant which was being installed at Weardale power station with that object in view. The profits earned during the year showed an increase of about £817 over the previous year. The amount of waste heat, gas, and steam that they received during the year had been considerably less, owing to the conditions arising out of the war, the reduction representing about 10 per cent. compared with 1914, and 15 per cent. as compared with 1913. The reduced quantity of waste heat available was largely in respect of those stations where they received exhaust steam from the blowing engines at blast furnaces, owing to the furnaces having had to be worked with different and varying classes of ore. Some of the coke-oven plants, also, had not been working at full capacity, but there was an improvement in this direction. Although the revenue had in consequence fallen, so far as it was derived from the output of electrical energy from the stations, there was some satisfaction in knowing that the supplies they had been able to give to the power companies had been of even greater advantage to them than in normal times, as, without the supplies of electrical energy derived from waste heat they would have been subject to largely increased costs owing to the higher price of coal. Referring to the excess profits duty, he said from estimates prepared he did not think they would be called to pay any appreciable amount.

Bruce Peebles & Co., Ltd.

At the annual meeting at Edinburgh, on Friday last, the Chairman, Mr. F. E. ANDREWS, said that they had considerably re-arranged the works and added to the buildings and machinery in order to expedite and increase the output. Their export trade, to which, ever since the company was formed, they had given unremitting attention, and to which they attached the highest importance, had naturally for the time being to give place to the more pressing demands

at home; but far from relaxing their efforts to keep closely in touch with all their foreign markets, they were increasing such efforts, and had already joined hands with several other well-known firms in forming a company to push business in Russia, so that at the conclusion of hostilities they would be in an advantageous position to deal with the large field for electrical engineering work which existed there. As regarded electrical machinery, they were constantly overhauling and improving their designs; their speciality, the Prebles-Lia Condenser, continued to gain in favour; a great many had been supplied during the year, and they had a large number on order at the present moment. The profit from manufacturing and trading amounted to £13,945, compared with £11,649 for the year 1914. To this must be added interest and transfer fees £71, as against £619 last year, giving a total profit for the year of £14,916. There was a net profit of £7,006, as compared with £3,892 a year ago. This sum of £7,006 went to reduce the adverse balance against profit and loss account, which would now only amount to £10,686, and would, he hoped, be entirely eliminated in the course of another year. Their cash position had now for some time been entirely satisfactory. They had spent £4,660 during the year on maintenance out of revenue. Upwards of 34 per cent. of their workpeople had joined His Majesty's Forces, a large number of the staff were also serving, and practically all others of military age duly presented themselves for attestation under Lord Derby's scheme. They had to mourn the loss, among others, of Capt. W. Russell, a most valued member of their staff, and Capt. John Peebles, a son of the founder of the works and secretary of the company for many years. He could not speak too highly of the excellent work of the managers, Mr. Bastow and Mr. Bunting, of the staff, and of all their workpeople. Their financial position had steadily improved and might now be considered quite satisfactory. Sir John Cowan, of Edinburgh, was elected to a seat on the board of the company.

Mersey Railway Co.

Mr. J. FALCONER, M.P., presiding at the annual meeting, said that having regard to the difficult times, and that they had no goods traffic, the increase of £5,860 in the receipts must be considered satisfactory. The increase in expenditure was £5,125, due partly to higher cost of coal and labour. The bulk of the increased labour cost was borne by the Government, as was also the whole of the increased cost of stores and materials. The net revenue was £52,860, as against £52,125 in 1914. Since they had been working the line electrically they had put £2,000 a year regularly to the renewal fund, and they had said that when the sum reached £20,000 they would reconsider their position. It had now reached £22,066, and they had reduced the allocation from £2,000 to £1,000. They had now begun the payment of interest on the last of the debenture stocks, and when the full interest on that was completed they would be in a position to commence paying something to the preference shareholders. In reply to questions, Mr. Falconer said that local traffic had shown satisfactory development, more than maintaining the ratio of progress of past years. There had been practically a stoppage in the development of the country around the railway because nobody was undertaking building operations when building cost 30 to 40 per cent. above the normal. He did not know who would get the best of the bargain in the financial arrangement with the Government. It now looked like being a good bargain for the Government.

South Metropolitan Electric Light and Power Co., Ltd.

Mr. H. ST. J. WINKWORTH, presiding at the annual meeting on March 1st, said that the number of new consumers (313) was less than usual, as they had not carried out the usual extensions of small lengths of mains. The new mains laid were principally for giving bulk supply to the West Kent Electric Co. for power for factories, &c. The loss of revenue due to Government lighting restrictions was estimated at at least £8,000 to £9,000, but this was made good by new business and extensions. The total units sold increased by 37 per cent. to 9,185,742. The average price obtained was lower by reason of the bulk supply. The total sales in the show-room were £9,256, against £8,148, with £4,479 transactions, against 3,759. The total receipts were £80,576, as compared with £66,791. In regard to expenditure, coal had cost £5,700 more, owing to increased output, high freights, and inferior quality. In common with the other London companies, they increased their charges to consumers by 10 per cent. at the end of March, 1915. The total expenditure was 20 per cent. of the gross receipts, as against 36 per cent. in 1914. Owing to an ambiguity in the trust deed as to what they had to set aside to depreciation and in what circumstances, they had been in negotiation with the trustees with a view to defining the obligations under the deed. They had decided to fall in with the wishes of the trustees, and had transferred the £20,000 placed to reserve account in 1913 and 1914 to the depreciation account, and had carried to the depreciation account £16,750. A letter received from the solicitors to the trustees for the debenture stockholders indicated that they would be able to come to an agreement. The directors had under consideration the best manner of dealing with the amount due to the company by the West Kent Co. for work done, approximately £20,000. It would probably take the form later on of an issue of capital by the West Kent Co., but the precise form had not yet been decided upon.

The following figures show the progress of the West Kent Co.'s business:—1914, h.p. connected, 773; consumers, 59; gross revenue, £1,596; expenditure, £1,055; net revenue, £541. 1915, h.p. connected, 3,018; consumers, 531; gross revenue, £13,420; expenditure, £10,229; net revenue, £3,191. During the year considerable extensions, both of mains and consumers, had been made, securing important power loads of a substantial and durable character. The bulk of the energy had been taken from the supply mains of the South Metropolitan Co. In regard to the outlook, it was very difficult to say what would take place in these days, but their output at present was substantially more than at the corresponding period of last year, due mainly to the increased demand of the West Kent Co. On the other hand, it was difficult to obtain regular deliveries of coal, and owing to the exceptionally high freights now ruling it was impossible to say what coal would cost, but the average price was likely to be more than that paid last year. On the whole, the outlook was satisfactory.

Metropolitan Electric Supply Co., Ltd.

At the annual meeting on March 22nd an effort is to be made to secure the appointment of a committee of shareholders to examine into and report upon the position. A circular was issued last week asking for proxies in support of this move by to-day. The circular says:—"For some considerable time we, in common with many other shareholders of the above company, have been far from satisfied with the way in which its affairs have been administered. The dividend on the ordinary shares, which in 1905 was 10 per cent., has now fallen to 3 per cent., and we learn that three of the directors (Lord Avebury, Sir James Pender, and Mr. P. D. Tuckett, the latter having recently joined the board) are all so dissatisfied with the position that they have resigned their seats on the board. We feel the time has come for the shareholders to take some action to protect their interests."

The company has issued a reply to the circular, in which the Secretary writes:—"Without explanation the circular is entirely misleading. The board has not been satisfied recently with the conduct of affairs, and in June last decided upon a complete change of management. This has been effected, and it is on this change of management that the present opposition is presumed to have arisen. . . . The chairman will give the fullest explanation of the position at the general meeting."

Chelsea Electricity Supply Co., Ltd.

Mr. W. R. DAVIES, presiding at the annual meeting, on March 8th, expressed regret that, owing to the class of demand in districts like theirs, the year's working necessitated a reduction in the dividend. Some of the companies in the Metropolitan area who could command a power load had done better than in 1914, but this company's business, which was for domestic and shop lighting, had again been adversely affected, not only by the increased lighting restrictions and by the desire to economise, but also by the fact that there was at present no London season with its entertainments and festivities. The units sold were 149,000 less, being 3 per cent. to 4 per cent. below those of the previous year, but low-priced power units showed an increase of 12 per cent., and the reduction in the sale of the higher priced units was nearly 10 per cent. They had been fortunate in fuel expenses, which showed a reduction of £950. This was partly due to the fact that the Diesel plant had been running for the whole year and had taken the bulk of the load, and that the cost of oil had not increased in anything like the same proportion as the cost of coal. It was also partly due to their purchasing more current from the Central Electricity Co., so that the amount generated had been proportionately less, and to some slight extent, to their having sold fewer units. Repairs and maintenance and other costs were about the same as last year, but there were two other items on the expenditure side of the revenue account which called for special remark: one was that a special provision for income-tax of £1,500 was now necessary on account of the high income-tax; and secondly, that they had paid £1,200 away to men on military service. These two items alone more than accounted for the reduced distribution. In regard to the prospects for the current year, they must not look forward to any improvements, and they might even be faced with a further reduction of profit. This was due to the price of oil having risen very considerably, and to the reduction in the demand for current, which was still proceeding. The output for the first two months of this year showed a reduction of 62 per cent. over the corresponding period.

British Electric Transformer Co., Ltd.—The result of working for 1915 is considered satisfactory. After paying all manufacturing costs and expenses of administration, there remains a net profit of £21,065, plus £3,478 brought forward. Out of this £7,500 is put to reserve, £1,500 to depreciation reserve, 6 per cent. is paid on the preference, and 7½ per cent. on the ordinary shares, £837 is paid as extra remuneration to directors, and £1,004 is to be carried forward. Annual meeting: To-day.

Automatic Telephone Manufacturing Co., Ltd.—The ordinary share and transfer books are closed until 25th inst. for the purpose of preparing the dividend warrants on the ordinary shares for the year.

Doulton and Co., Ltd.—Dividend of 5 per cent., less tax, on the preference shares for 1915.

North Ormesby, South Bank, Normanby and Grangetown Railless Electric Traction Co., Ltd.—The annual meeting was held at Middlesbrough on the 9th inst. Mr. W. W. SPORN, who presided, said, in moving the adoption of the balance sheet, that the share capital of the company was £40,000, of which 12s. per share had been called up, yielding £21,678. Sundry creditors amounted to £121, making a total of £21,799. On the expenditure side, the cost of the Acts, including the opposition to the Middlesbrough Corporation, had been £4,012, buildings and overhead equipment had cost £14,139, and land and sundries had involved an expenditure of £2,754, leaving a balance of £879. The contract for the cars had not yet been completed, and the system remained unopened, but they expected to obtain four cars by the end of April. When the ten cars were available they could start at once. The Board of Trade had refused to sanction double-deck cars.

South Metropolitan Electric Trams and Lighting Co., Ltd.—The total revenue for 1915 was £69,281. After adding the balance brought in, deducting all expenses, and setting aside £4,500 to renewals fund, there remains £15,486, and the directors recommend placing to reserve £4,500, payment of dividend at rate of 5 per cent. per annum on preference shares for year to December 31st, 1914, £8,478, to payment on account of preference dividend for year 1915 at rate of 1 per cent. £1,695, carrying forward £812. An agreement has been entered into with the County of London Electric Supply Co., Ltd., for the supply of current in bulk to the company's station at Sutton, which is accordingly being converted from a generating station to a sub-station. Supply from the County company was first taken on December 12th.

Stewarts and Lloyds, Ltd.—The directors, after setting aside £100,000 for depreciation, and after making provision for estimated contingencies, recommend dividends for the half-year to December 31st last at the rate of 6 per cent. per annum on the preference shares; at the rate of 10 per cent. per annum on the preferred ordinary shares; and for the year a dividend of 2s. and a bonus of 6d. per share on the deferred shares, placing £60,000 to general reserve, £20,000 to employees' benefit reserve, and carrying forward £100,000.

Listowel Electric Light and Power Co., Ltd.—At the annual meeting, held recently, the chairman said that the present position was most satisfactory, and the result of the third year's working was remarkable. The gross profits, after paying all working expenses, amounted to £322. In three years they had put to reserve £490. They recommended this year a dividend of 8½ per cent., carrying forward £32. They looked forward to a considerable expansion of business this year, when certain new works and plant required to cope with the demand had been completed.

Direct Spanish Telegraph Co., Ltd.—Dividends at the rate of 10 per cent. per annum, less income-tax, on the preference shares, and 6 per cent. per annum, less income-tax, on the ordinary shares (making 5 per cent. for the year) have been announced for the last half of 1915, and a bonus of 2 per cent. on the ordinary for the year, free of income-tax, is recommended.

Melton Mowbray Electric Light Co., Ltd.—At the annual meeting, held recently, it was reported that the revenue for the year, after adding the balance brought forward, amounted to £3,241, of which £2,286 was available for distribution. A dividend at the rate of 3 per cent. per annum was declared; £900 was placed to reserve for renewal of plant, and £786 is to be carried forward.

Reduction of Capital.—A petition for the reduction of the capital of the Compañía de Electricidad de la Provincia de Buenos Aires, Ltd., and Red., from £1,350,000 to £825,000, is to be heard on March 21st.

Nairobi Electric Power and Lighting Co., Ltd.—An interim dividend at the rate of 6 per cent. per annum on the preference and ordinary shares for the last half of 1915, less income-tax, is being paid.

Scarborough Electric Supply Co., Ltd.—The profit for 1915 was £1,078, plus £2,002 brought forward. After providing for interest charges, and placing £1,000 to the depreciation fund, £1,716 is to be carried forward.

Western Telegraph Co., Ltd.—Second quarterly dividend 3s. per share, free of income-tax, for the year ending June, 1916, is fixed at the rate of 6 per cent. per annum.

W. T. Glover and Co., Ltd.—After paying 5 per cent. on the ordinary shares, and transferring £20,000 to reserve and writing down investments, £11,700 is to be carried forward.

Launceston and District Electric Supply Co., Ltd.—The directors have declared a dividend of 3 per cent.

STOCKS AND SHARES.

TUESDAY EVENING.

Verdun is the cynosure of the eyes of finance as much as it is of those of the nation at large; and, hopeful views being entertained of the end of this colossal struggle, Stock Exchange markets on the whole are firm and cheery. The Budget is expected towards the end of the month, and the next War Loan early in April. City circles are discussing with animation the pros and cons of a popular loan in the

shape of premium bonds; but that more money will have to be provided in some way or other before very long is obvious to everybody.

This consideration weighs but lightly upon current quotations for securities. There is a tendency to look beyond the war and to invest money in the shares of such undertakings as are now working under abnormally unfavourable conditions, such as will right themselves automatically when the war is over. The same motive which checks investment to any large extent in armament shares is at work in directing the search for issues at present depressed by the war clouds.

Such a development is one that should console the proprietors of electric lighting shares in these present darkened days. The war has bitten badly into profits, for reasons that are well known to the public, and to the investor in lighting shares particularly. But afterwards there should come such a reversal of fortune amply compensatory for the lean times through which the companies have passed; and those who are on the look-out for shares of such class might do well to include the electric supply market in their purview.

Circulars have been flying about in connection with the affairs of the Metropolitan Electric Supply Co. Three of the directors, Lord Avebury, Sir James Pender, and Mr. P. D. Tuckett, have resigned, and five shareholders are inviting support at the forthcoming general meeting, with a view to securing the appointment of a committee of shareholders to examine into, and report upon, the position. The directors, in reply, say that a complete change of management has been effected, and that the chairman will give the fullest explanation of the position at the meeting next Wednesday, March 22nd. Meanwhile, the price of the shares keeps dull at 24.

Various ex-dividend markings have reduced other prices in this market to levels at which they pay handsomely, even on the basis of the reduced dividends declared in respect of 1915. There is accordingly plenty of scope for the far-seeing investor to whom reference has just been made. The City of London report is considered satisfactory, and the large increase shown by the expenses, as compared with those of the receipts, is regarded as a factor due entirely to the war. The Newcastle Electric Supply Co. has declared a dividend of 3½ per cent., making 6 per cent. for the year, which compares with 5½ per cent. paid in the previous twelve months.

Mexican matters are once more to the front, in consequence of the increased activity on the part of some of the insurgents, headed apparently by General Villa, who are making things lively on the Mexican-American frontier. Various United States citizens are said to have been killed in the Mexican raids; and once more, for the nth time, the expectation revives that President Wilson will take a firm stand and maintain a stiff upper lip in his demands for reform in Mexico. It is difficult to conceive that even President Wilson can be content with formalities on this occasion, because it is certain that if he cares to do so, he can command the support of his country in enforcing order into his turbulent neighbours of the Isthmus, and the sending of a few thousand American troops to Mexico really looks as though he "meant business."

Although this is regarded as something of an ultimate bull point for Mexican stocks and shares, it has not saved further falls in the railway and industrial securities. Mexico Tramway Firsts, for instance, are down 4 points, Mexican Light and Power common fell 2 to 20, and most of the bonds are more than ever difficult to realise.

Amongst other foreign descriptions, British Columbia Electric preference dropped 2 to 53, and there is noticeable weakness in Anglo-Argentine Tramways first preference, a fall of ½ taking these to 3½; while the second preference weakened in sympathy to 3½, as will be noticed from our lists of stocks and shares this week.

The feature in the market for Home Railway stocks is the buying of the low-priced issues. Gambling counters, many people would call them; but those who are putting money into such things contend that British railway systems of importance never come to a complete end, and that recovery sooner or later is inevitable. Therefore, the strength of Metropolitan and Districts is well maintained. Underground Electrics are duller. At the meeting held last week, Sir Robert Perks suggested that fares should be raised, but the chairman, Lord George Hamilton, stated that the adoption of such a policy would encourage competition and probably cause a great outcry throughout London. It was very easy to lose traffic, he said, but traffic once lost was very difficult to recover.

British Electric Traction has been rather wanted, in consequence of the result of the law case which has just been settled by the Court of Appeal. The Public Trustee, as executor for a deceased large holder of income certificates in the company, sought to show that he was not bound by the scheme for reducing the capital. But the judges held that the directors had acted in perfect good faith; and upon the evidence before the Court, their lordships were of opinion that the appellant, by accepting the stock and shares under the scheme, ran no risk of incurring any future liability in respect of them. The preference stock was dealt in on Monday at 72, and the 7 per cent. non-cumulative preference at 46 a week ago; while the most recent bargains in the preferred and deferred were at 16 and 10½ respectively. No doubt the company will now press forward the completion of its scheme, and proprietors will hope to be in possession of their new securities before long.

The Metropolitan Electric Tramways, in its report, shows a falling away of £18,000 to £513,000 in its gross revenue for last year. The company earned 3,669,000 fewer passengers, but the average fare was higher. The net revenue, however, comes out at only £3,000 less. The ordinary dividend is 1 per cent. against 2 per cent. a year ago. The price of the ½ per cent. debenture stock is 78½, and the 5 per cent. debenture stock stands about a point lower.

Canadian lighting and power issues are creeping up again, and the American companies are sharing in the industrial activity produced throughout the States by the war conditions of Europe. The Pennsylvania Water & Power increased its profits, and announces that a new concern has been formed, called the Shaviningan Electro Products Co., the objects of the latter being to manufacture and sell electric furnace products.

Telegraphs and telephones are wholly placid. Business is quiet in this section, and there are no changes to report on the week. Telegraph Constructions are quoted ex the dividend of 30s., allowing for which they show a loss of 14. Babcock & Wilcox are strong, the price stiffening to 2½ on buying from the North. The other manufacturing issues are, on the whole, a good market. Rubber shares remain firm, business in them being more active than in anything else round the Stock Exchange. Considerable animation characterises the department devoted to base-metal shares, more particularly those of the Broken Hill group. The copper division is a little uncertain of itself, by reason of the frequent and violent fluctuations in the price of the metal.

Field Water-Purification Plant.—A recent issue of the *Canadian Engineer* contained a description of a portable ultra-violet-ray sterilisation plant, designed and installed by Captain F. A. Dallyn, to provide a better water supply to the Ontario troops in a Canadian camp. The water is pumped from the Niagara River, which is greatly polluted, through a mechanical filter of the reverse-flow type, mounted on a four-wheeled wagon. From this it goes to the sterilising apparatus, passing through three quartz tubes, to each of which is attached an ultra-violet-ray lamp, the emanations reaching the water through the quartz. The tubes, 4 in. long by 1½ in. diam., are carried in a casting and watertight joints are secured by means of rubber gaskets. Three windows are provided in the casting, through which the operator can watch the lamps, &c. The outfit includes a Westinghouse generator, engine, and Albany pump. Current is supplied by a 2½-kw. 220-volt direct-current dynamo; the pump is a 2½-in. water-sealed rotary type machine, with a capacity of 3,000 gallons at 250 R.P.M. These are driven by a 9.H.P. Lister vertical petrol engine, fitted with automatic pump lubrication, enabling it to run between 200 and 250 hours without refilling the oil chamber, pump-fed carburettor, &c. The plant was purchased by the Government upon the recommendation of the assistant director of medical service; it has reduced the normal count in raw water of 4,000 bacteria per c.c. to from 10 to zero. Colon bacilli were commonly present in 0.01 c.c., but after sterilisation were normally absent in 50 c.c.

Economy in Carbons.—About nine months ago the Electrical Engineering and Equipment Co., Ltd., of 109-111, New Oxford Street, W.C., offered a prize of £25 to the cinematograph operator who could show the biggest saving by the use of "R-flex" carbons during a period of six months, as compared with a similar period using any other make. We are informed that the prize has been awarded to Mr. C. J. Lord, of the Princess Picture Palace, Rawmarsh, Yorks., who reduced his energy consumption from 2,560 to 1,890 units, or 26 per cent., finding that with these carbons he could use a current of 25-30 amperes instead of 30-40 as formerly, and yet get a better and whiter light.

THE RENAISSANCE OF THE LOW-TENSION FUSE.

By JOHN A. CRABTREE.

(Concluded from page 277.)

Reference has already been made to the heating up of the fuse handle. This is, of course, aggravated with longer break fuses, and is an argument against the unnecessary extension of the break. Further, such heat represents wasted energy, and therefore money.

Consider for a moment a 6-way T.P. 4/50-amp. per way 500-volt fuseboard, 6-in. break fuses, as shown in fig. 3. The length of wire will be about 10 in. for each fuse (terminal to terminal) or a total length of 15 ft. The fuses

FIG. 3.

are wired with two strands 21 s.w.g.*tinned copper, having a total resistance when hot under working conditions of about $\cdot 165 \omega$ —

∴ C^2R loss = 400 watts (approx.).

The yearly cost of this, working 60 hours per week at 1d. per unit = £5.

If, therefore, the same safety could be procured with suitably designed shorter break fuses, having a fuse-wire length of 5 in. from terminal to terminal, a running cost saving has been effected of £2 10s. per annum.

Fuse Wire.—Tinned copper wire is almost universally used, is easily procured and generally handy. The question

FIG. 4.

of few or many strands requires attention, and here we are between two alternatives. In the graph, fig. 4, are plotted three curves for open-type fuses, blowing at 200 amperes, one curve giving the total cross-sectional area, and the second and third curves the approximate total resistance of various stranded fuse wires (hot and cold).

It will be seen that the greater the number of strands the greater the resistance (and, therefore, the C^2R loss), and the less the total cross-sectional area. It is thus perfectly obvious that while a fuse with few strands will have a greater explosive effect on a "short," owing to the greater amount of metal volatilised, it will be distinctly cooler in working. On the other hand, the many-stranded fuse, while having a lower explosive effect, will have the disadvantage of excessive heating to contend with. Premature blowing, disintegration of the insulation, softening of the spring contact clips, handles too hot to hold, excessive waste of energy—all these are the frequent results of the many-stranded fuse.

That the waste of energy is not entirely a negligible item may be seen by considering a factory wired for 10 50-H.P. motors, 440 volts D.C., and having 20 fuses wired to carry 100 amperes normal. Having the fuses similar to fig. 3, the total C^2R loss (hot) will be:—

For single-strand wire (14 s.w.g.) = 600 watts approx.

For six-strand wire (23 s.w.g.) = 1,100 watts approx.

Allowing for $60 \times 50 = 3,000$ running hours per annum, we have the following result at 1d. per unit:—

Loss with single-strand wire = £7 10s. per annum.

Loss with six-strand wire = £13 15s. per annum.

Therefore, the additional loss with six strand = £6 5s. per annum, or about 12s. 6d. per annum for each 50-H.P. motor installed.

Porcelain Insulation.—Porcelain is the material almost universally adopted in this country for the insulating shields and handles. It may be said to be fairly cheap to produce, can be moulded to any reasonable requirements, and is an excellent insulator. On the debit side it is brittle, cannot be worked up after firing, cracks badly under local heat, and possesses little mechanical strength. Satisfactory fuse design must make full allowance for these weaknesses, or an unreliable fuse will be the result.

From the national point of view already referred to, one feels compelled to admit that our home Potteries have something yet to learn from the foreign, and particularly the German, competitor. Why this is so, one cannot say. Whether it is a question of the clays used, the mixing, moulding, or firing, is a matter for the Potteries to decide: but undoubtedly the future of our electrical switchgear industry is largely bound up with the enterprise and foresight of our porcelain manufacturers. The firm discovering the secret (if secret it is) of the German porcelain—its clean accuracy, excellent vitreous body, and low price—will find a fortune awaiting it after the war.

Damaged Fuses.—The distinctive forces operating upon the fuse may be classed under five headings.

- I. Ordinary wear and tear.
- II. The explosive force of the arc.
- III. Sudden expansion stresses set up in the insulating material by heat.
- IV. Damage to the metallic parts, by arcing.
- V. Loosening of parts.

I. Ordinary Wear and Tear.—This factor requires attention in all mechanical contrivances, and needs little mention, beyond what is later covered by Sec. IV.

II. The Explosive Force of the Arc.—This may be considerable on any but the very smallest of fuses, and unless means are taken to counteract the danger, the fuse will be useless after the first "dead short" or heavy overload. It is, therefore, necessary to make suitable provision. Ample ventilation should be provided, where it is desired that the gases should escape; and suitable deflectors should be fitted wherever there is any possibility of arcing across poles or to earth. Special safeguards, such as cartridge fuses, magnetic blow-outs &c., need not be here elaborated.

III. Sudden Expansion Stresses.—Few designers seem to pay any serious attention to the excessive local heat stresses set up in ordinary fusegear. Yet if the trouble of broken china is sifted to its root cause, it will be found that a large proportion is damaged through this cause.

Take, for example, the old tubular hand-grip fuse. The writer has noticed that a large proportion ultimately fracture, as shown in fig. 1, p. 276. An examination of the fragments shows that the initial cracks are often of long standing, and their gradual extension may be distinctly traced. The last "blow," of course, smashes the handle, already weakened by the earlier cracks, and the internal expansion stresses set up by the sudden heat. It therefore seems a reasonable conclusion that the heavy metallic ends and large cooling flanges at A rapidly absorb the heat, while the central, or hand-grip section B, can only dissipate the heat by a slow radiation. The difference in temperature, therefore, between parts A and B sets up stresses at C, and fractures the china. It has also to be recognised that the rapid heating up of the china round the core hole, also sets up stresses round the outside of the handle, frequently causing this to crack, as at D.

The old ventilated tubular fuse of Reyrolle make was, perhaps, one of the best tubular hand-grip fuses ever made, on account of the special consideration given to the question of ventilation around the fuse wire tube. This ventilation not only served to keep the handle cool for handling, but also prevented undue heat stresses cracking the porcelain.

It is advisable to keep the hot fuse wire from contact with the porcelain, and the provision of asbestos tubes, braiding or pads, is decidedly necessary to shield the porcelain at the vital parts from the excessive heat.

IV. Damage to the Metallic Parts by Arcing.—It is impossible to entirely avoid this when ordinary fuse wire is used. Where fuses of any size are in question, however, it should be possible to so arrange the design that the arcing at the terminal blocks will not affect the re-wiring and contact surfaces. Some fuses burn up the fuse wire terminals, so that it is quite impossible to loosen the screws for re-wiring, and one is compelled in emergency to merely coil the fuse wire round the binding terminal. Others burn up the terminal faces, and occasionally weld fuse and base contacts in one mass. A method sometimes adopted consists in leading the fuse wire through a small hole in the insulation. This works all right if the fuse does not blow in the hole. When it does, however, the cure is as bad as the ill, and a blocked or shattered fuse is the result.

V. Loosening of Parts.—This principally occurs on A.C. circuits, but should, of course, be considered as a matter for standard design, and lock-nuts, spring non-return washers, and substantial screw-driver slots to all thumb-nuts and screws, should be supplied without question. Unfortunately, price only too often enters into these refinements of design, and a good fuse is spoilt by the general objection to pay the fractional additional costs entailed.

Cabinets (Wood and Iron).—The size and ventilation of cabinets have each a considerable effect upon the fuses enclosed. Fuses that are cool in operation in the open air will often heat up excessively in a confined space, and cause endless trouble. Softened contacts (particularly the upper ones), pitted contact surfaces, and premature fuse blowing, are all the results of this cause. Wherever possible, cases should be suitably ventilated, or have sufficient volumetric capacity and cooling surface to counteract this tendency. The sudden rise in pressure owing to a fuse blowing, has also to be taken into consideration. With conduit wiring, the gases have an opportunity of escaping up the tubes, but where armoured or other cables which present no outlet to the gases, are used, a serious rise in pressure may result. Occasions have been known where locks have been smashed, and heavy doors blown open through this cause. Apart from plain holes, the breathers shown in fig. 5 have been adopted with success.

The clearance from live metal to case requires careful attention, for while a minimum clearance of one inch may

correctly designed board than to resort to makeshift safeguards.

Wiring Arrangements.—The question of wiring should be carefully considered, and it is to be regretted that designers are not compelled by law to pass through a stringent course of training, in wiring up their own boards. Boards are often delivered and found to be absolutely unwirable. Battens have to be carved and hacked away, bases packed up, cables twisted into unnatural kinks, and conduit brought all round the case to obtain a suitable entry. It is also to be regretted that buyers seldom know what they want when ordering. To make a first-class job with a board of any size, the position of entry of the cables should be considered, and settled, before the board is set out. The board should be built round the cables, not the cables round the board. For a little extra cost on the layout of the boards, pounds would be saved in the connecting up. Instead of manoeuvring heavy cables into impossibly placed sockets, heavy cables should lead in direct, with little or no bending of any kind whatever. Yet how often is the manufacturer held up till the very last minute for the position of the cable entry into the case, and expected to deliver the job complete by return. The buyer arranges his cables to enter N, S, E or W, as it pleases him, and then curses the makers for supplying an unwirable board.

To sum up: We have yet to obtain the ideal fuse, but the following leading features may be considered as essential in its development (see also fig. 3).

1. Substantial, electrically and mechanically.
2. Must pass stringent short-circuit tests without damage to itself.
3. No danger of accidental contact with live parts, whether fuse is "in" or "out."
4. Safe to handle, even if inserting on a short.
5. Fuse wire as short as possible, compatible with safety, and reliability.
6. Well-ventilated handle, cool in handling.
7. Porcelain free from excessive heat stresses.
8. Should not overheat when enclosed in iron case.
9. Easily re-wired, and free from danger of burnt-up terminals.
10. No possibility of arcing to iron case.
11. Fuseboards easily connected up, with as little bending of heavy cables as possible.
12. Inexpensive.

CONTINUOUS-CURRENT RAILWAY MOTORS.

A PAPER on the above subject, by Mr. E. V. PANNELL, was read before the INSTITUTION OF ELECTRICAL ENGINEERS and discussed on March 9th; an abstract of the paper appeared in our last issue.

Mr. F. W. CARTER, who opened the discussion, said the paper was very opportune, the subject being highly specialised and the literature on it being behind development. The author was wise in limiting the subject to motors for multiple-unit trains; he thought he attached too much importance to the hourly rating, which was not in any sense a criterion of the service capacity of this type of motor, and there had been considerable discussion as to whether it should be retained for that reason. He, therefore, disagreed that the one-hour rating represented the maximum desirable current during acceleration; although this was probably true of the old tramway motors, modern commutating-pole machines often accelerated at much higher than the one-hour rated capacity. In this country we should require much larger clearances than were indicated by the author in his reference to linear dimensions. When the ventilated motor was first introduced, it was feared that it would pick up dust, snow, &c., but now from 15,000 to 20,000 of this type had been sold by one American concern alone, representing 1½ million H.P. The author was wrong in stating that the Central London motors were semi-ventilated with hollow shafts; some motors of this type for use in America had been experimentally made, but abandoned because of brake dust getting into them, and the Central London motors had solid shafts, like the District motors. Referring to the 200-kw. 1,200-volt ventilated motor shown in fig. 8, the bearings were very small, and a bad feature; they were much smaller than usual, and less than those on the new Lancashire & Yorkshire, and South-Western motors. He thought an extra 4 or 5 inches in bearing length would be required for satisfactory service. The design also showed a lip on the commutator used as an oil thrower, which was a bad feature and would, he suggested, require replacing with a proper oil thrower, and these alterations would, he considered, reduce the core length to less than the 18 in. shown. It was true that roller bearings might be considered, but

FIG. 5.

be ample under ordinary conditions, there are often circumstances where such a clearance is quite useless. Consider the case of fuses on circuits with an earthed return, where one has the full voltage between the lead in terminals, and the iron case. In the event of a blow, the arc has a strong tendency to jump to earth and burn out the whole fuse-box in a "dead short." Where, therefore, there is any possibility of a fuse blowing to earth, suitable deflector plates or shields should be fitted at the required positions, unless it is possible to combine such shields in the design of the fuse unit. Asbestos lining is often worse than useless, unless well varnished, and micanite or vitreous enamel put a board outside a competitive basis. It is much better to have a

experience with them was lacking. He very much doubted whether a 200-kw. ventilated motor of ordinary design could be got into the ordinary gauge, without recourse to large wheels or roller bearings, even with the smaller commutator due to using 1,200 volts. Artificial limitations, such as due to the one-hour rating, were undesirable.

Prof. S. P. SMITH was interested to notice the author's advocacy of field control, although it was in use before the series-parallel control became the vogue; now it was coming back in combination with the latter. The unfortunate part about all such arrangements was that it was not economical to increase the types in use on existing systems, and it might involve great capital cost to convert to field control. He could not quite agree with some of the author's data regarding recently developed machines; the 600 and 1,200-volt. machines were reasonable, but he thought the 1,800-volt machine was open to criticism. For instance, 20 volts average per segment might mean a maximum of 30 volts, which, he thought, would lead to sustained sparking between segments; the segment pitch was necessarily small. It would be interesting to know whether any such voltage had been used. The segments per slot were also numerous, and the design appeared to be an effort to do the work with too small a motor.

Mr. LVDALL said inside the motor there was very little room for field connections, and these should be kept to a minimum. In regard to field control, the diverter was one method, but, as mentioned in the paper, it had given trouble through flashing over, and it had been proposed to use a relay to cut out periods of the weak field, but to get a satisfactory relay was the difficulty. Part of the field winding could be cut out in various ways; it was possible to cut out the two bottom poles or alternative poles, but there might be trouble with both ways. Then there was tapping off the middle point, which was, perhaps, the best thing to do. He agreed that it was undesirable to talk about the maximum value of the average voltage, which meant nothing; the factor was the maximum voltage.

It having been suggested by one speaker that diverters might be made inductive with advantage, Mr. HIGHFIELD stated that in connection with the series wound Thury machines used by his company the diverters had been altered from non-inductive to inductive with satisfactory results. Previously, they had had trouble with the diverters such as was indicated in the paper.

Mr. ROGER SMITH, who in the absence of the author had read the paper, replied to one or two points on his behalf. The author, he said, had mentioned that too much importance should not be attached to the one-hour rating, and had advocated service rating. The Engineering Standards Committee had not yet legislated for railway motors in this country, and for the time being was practically using the American standards. He agreed, on behalf of the author, that the 200-kw. ventilated motor shown had serious defects from the railway operating point of view; there was too little clearance between the end of the commutator and bearing. The railway motor was a pure compromise, and the less difficulty put in the way of the designer, and the more they asked only for results, the better the results would be. Field control was one of two things making the D.C. series motor really useful; the other feature was regenerative control, and both were of singular importance in railway work.

CONTROL EQUIPMENTS FOR WINDERS AND HOISTS.

THE apparatus illustrated and described in the following article has been specially developed by the British Thomson-Houston Co., of Rugby, for the control of electric motors used for winding and haulage in collieries, and furnace hoists in steel works.

Each equipment consists of a drum-type master controller, a panel on which electrically-operated air-break contactor switches are mounted, and control resistances of the air-cooled type.

The operator can start, stop, and reverse the electric motor by means of the master controller, the contactors closing automatically when the controller handle is moved. The closing of the contactors can only occur in the correct sequence, and each contactor remains open until the motor has accelerated sufficiently to permit additional resistance to be cut out of circuit without excessive current being taken from the line. Thus, even if the operator moves the control handle too quickly from the "off" position to the "full on" position, the current limit relays on the contactor panel will automatically protect the motor against damage and permit it to be started up in the shortest time compatible with safety.

These contactor equipments are particularly suitable for winders and hoists, and possess the following advantages over liquid controllers, as clearly explained in the paper by Mr. J. H. Rider, on "The Power Supply of the Central-Rand Mines Group," read before the Institution of Electrical Engineers on December 9th, 1914.

(a) No heavy work is imposed on the driver in operating the control lever.

(b) No energy is wasted in continually pumping electrolyte.

(c) The full speed of the motor is obtained, as, when the last rotor switch closes, the rotor is metallically short-circuited.

(d) No energy is wasted in the rotor resistance during the period of full-speed running, but only during the periods of acceleration and retardation.

(e) There is no risk of flashing over, however quickly the control lever is operated.

FIG. 1.—CONTACTOR PANEL FOR ROTOR CIRCUIT OF 400-H.P. INDUCTION MOTOR.

(f) There is no cooling pipe system to be kept clean and in order.

(g) The rate of accelerating the speed of the motor is automatically controlled by a relay system, so that, although the control lever may be put right over at the start, no succeeding switch closes until the current, which has increased on the closing of the preceding switch, has fallen to a predetermined and adjustable amount.

Contactors Panels.—For alternating-current slip-ring motors, one set of contactors is provided for opening and reversing

FIG. 2.—CONTACTOR PANEL FOR REVERSING STATOR CIRCUIT OF 3,900-VOLT INDUCTION MOTOR.

the stator connections, and another set for short-circuiting the resistance divisions in the rotor circuit.

Air-break contactors are recommended for this service, even for line voltages up to 3,900, as the wear on these is less than that on contactors breaking under oil.

A typical contactor equipment for reversing stator circuits is shown in fig. 2.

The contactor panel shown in fig. 1 is a typical panel for use in the rotor circuit for cutting out the controlling resistances.

For line voltages of 650 and less the contactors for controlling the stator circuit are mounted on the same panel as the rotor contactors, and are of the same general type as the rotor contactors. A typical panel is shown in fig. 3.

For direct-current motors the contactor panel consists of four contactors used for reversing the armature connections,

FIG. 3.—CONTACTOR PANEL FOR STATOR AND ROTOR CIRCUITS OF 200-H.P., 650-VOLT INDUCTION MOTOR.

and a number of other contactors for short-circuiting the divisions of the starting resistance. Fig. 4 shows a typical contactor panel for reversing a direct-current motor.

FIG. 4.—CONTACTOR PANEL FOR REVERSING 66-H.P. CONTINUOUS-CURRENT MOTOR.

Resistances.—The resistances used for this service consist of iron grids mounted on mica insulated rods which are fixed to the main resistance frame. Pure mica washers are used for insulating the grids from each other and from the frame.

For small motors the resistance units are mounted as shown in fig. 5. This form of frame consists of a number of separate boxes, the end castings of each box being arranged with lugs for bolting to similar frames on the top, bottom, and sides, so that any number of boxes can be bolted together to form a complete resistance.

This form of mounting is recommended in cases where the

total resistance necessitates the use of not more than six boxes.

For large motors, where more than six resistance boxes are required, the units are mounted as shown in fig. 6. In this case the end castings are dispensed with, and the rods carrying the grids are assembled in an iron pipe framework.

FIG. 5.—TYPE C.G. FORM G.G. RESISTANCE WITH JUNCTION BOX. (Side cover removed.)

Master Controller.—The motor can be started, stopped, and reversed by means of the master controller, which is of the British Thomson-Houston standard tramway type.

This controller makes or breaks the circuit of the contactor switches, which then automatically controls the current flowing to the motor independent of the operator.

FIG. 6.—TYPE C.G. FORM E.E. RESISTANCE, FITTED WITH INSULATING RODS. (Side cover removed.)

Control equipments as described are operating satisfactorily in mines in Great Britain and other parts of the world.

TAR OILS AS FUEL FOR DIESEL ENGINES.

At the February meeting of the DIESEL ENGINE USERS' ASSOCIATION, Mr. W. BATHO, of Messrs. Sulzer Bros., remarked that the price at which they had been accustomed to buy mineral oils had been such that there was nothing to induce manufacturers of Diesel engines to expend large sums in experiments; for years past, however, the Continental journals had contained a large amount of information on the subject. In Switzerland, about 140 Diesel engines installed by Messrs. Sulzer Bros. were nearly all running on tar oil prior to the

outbreak of war, the sizes varying from 20 to 1,000 B.H.P. This tar oil was all imported. Messrs. Sulzer Bros. had carried out long experiments with vertical-retort tar and had designed a special method of burning it. After the outbreak of war they installed their own tar distillation plant, and the results had been very satisfactory. The reason why they installed this plant instead of using ordinary tar was that although the latter gives fairly good results, it is not such a clean and satisfactory fuel as tar oil. Further, vertical-retort tar can, as a rule, only be obtained in small quantities, and other kinds of tar require distillation to make a satisfactory fuel. It is also more economical to use tar oil, as the valuable by-products, such as benzol, toluol, ammoniacal liquors, and anthracene, would be lost if the tar were used direct in the Diesel engine.

In France, where they had installed some 50 engines, tar oil was almost universally in use. The sizes varied from 20 to 3,500 B.H.P.

The greater part of Messrs. Sulzer Bros.' engines run with tar oil without any auxiliary fuel pump, and this refers particularly to their two-stroke engines. A great deal, however, depends upon the conditions under which the engine has to work, and in some cases they have fitted their own design of auxiliary pump with a pilot jet for ignition purposes. They have found that it is not sufficient to inject a drop of oil in a solid state, so to speak, in advance of the main fuel charge, but this ignition drop requires to be properly pulverised in the same way as the main fuel supply. Unless this is done, the initial combustion is impaired, and it also considerably increases the consumption of the ignition fuel.

Light oils, such as benzol, with a low flashpoint, are not suitable for Diesel engines. The heavy tar oils are almost all suitable. It is possible that when oil has been stored, especially during cold weather, a certain amount of crystallisation takes place. These crystals usually consist of fuel of high value, which, by sufficient heating of the tar oil, as a rule become easily dissolved. In purchasing tar oils the following points should be considered:-

The specific gravity should be between 1 and 1.1.

The lowest flashpoint is about 70 deg., but for safety against fire it should be in the neighbourhood of 100 deg. to 150 deg. F.

Tar oils are as a rule dark to almost black. One drop on white paper should show no black residue, as is the case with tar. This black residue means a large percentage of free carbon or other tar ingredients.

The lower calorific value is between 15,500 and 16,500 B.T.H.U.

The unburnt residue of tar oil should not exceed 1 per cent. The amount of water should not exceed 1 per cent.

With coal tar oils the sulphur contained can be from 0.5 to 1 per cent.

If the tar oil contains a high percentage of residue which only begins to vaporise at 400 deg. C., the same results can be expected as with tar; that is to say, one must anticipate a considerable amount of dirt in the engine, and the exhaust valves will require frequent cleaning and grinding in.

With gas tar the most important point is the contents of asphalt and pitch. Tar obtained from the manufacture of gas in vertical retorts can be used without difficulty by the adoption of an auxiliary fuel pump and specially prepared lubricating oil. Tars from horizontal or inclined retorts are not suitable, and they, as well as coke-oven tars, should be distilled for the recovery of tar oil, and in this way brought into use as fuel for Diesel engines.

The specific gravity of coal tar is 1.06 to 1.12.

If the viscosity is over 20 deg. Engler at a temperature of 20 deg. C., the tar is unsuitable for good combustion.

With regard to flashpoint and water, the same remarks apply as to tar oils. It should, however, be carefully noted that when using tar as fuel, certain inconveniences will be experienced, and these will be considerably increased if the amount of water contained in the tar is high.

A thin layer of the fuel poured on to glass or paper should show the smallest possible quantity of black or crystallised deposits.

Tars with a calorific value below 15,500 B.T.H.U. are of little use.

The ashes content should not exceed 0.1 per cent.

The sulphur content may be up to 2 per cent.

The impurities that remain after evaporation at 350 deg. C. should not exceed 45 per cent.

Mr. L. W. JOHNSON, of Messrs. Banks, Warner & Co., Ltd., referred to the entirely successful manner in which tar and tar oils had been used in Diesel engines in Germany. In that country the approximate total B.H.P. developed by Diesel engines was 850,000, of which about 150,000 was obtained from tar or tar oils, the corresponding figures for Great Britain being about 80,000 and 1,000 respectively. The lowest import duty on petroleum oils brought into Germany was 36s. a ton, which naturally was a great encouragement to the use of the home product.

A great saving of national wealth might be effected by the use in internal-combustion engines of fuel oil distilled from the coal produced in our own country as compared with the burning of coal in boiler furnaces; he estimated it at 30 million pounds sterling to the consumer per annum, whilst the value of the coal would be increased by fully 75 per cent.

Tar oils have so far chiefly been used for creosoting timber, and most of the available supplies are now sent to the United

States; in 1913, 40 per cent. of our total production of tar was exported to America, the approximate amount being 200,000 tons; which would provide nearly a quarter of a million B.H.P. working 3,600 hours. A further large percentage was exported to Germany, and this now also goes to the United States. Lately, however, in America a number of tar distilling plants are being installed, which fact is of much importance to us.

The speaker stated that since the beginning of this year he had been in touch with most of the sources of supply of tar oils in this country, and that out of some 50 firms approached only about a dozen had been able to make any offers at all. Of these, about one-half could supply products which would be suitable for use in Diesel engines, and the total quantity would amount to about five to eight thousand tons per annum. The prices quoted ranged from 24d. to 6d. a gallon, or, say, £2 10s. to £7 a ton at their works. It seemed probable that a further million gallons of suitable fuel oils could be supplied from other sources. The price of fuel oil suitable for Diesel engines on the Pacific coast of America was said to be 1d. per gallon, and on the Eastern coast of America 2d. per gallon. (Owing to taxation of imports in Germany, tar oil had been cheaper to use than even Galician fuel; thus Diesel engines there had been developed to burn tar oils, and the exclusive use of inland fuels had tended to make Germany independent of foreign countries. The value of creating a home product lay in the fact that thereby competition was established with the foreign product, and prices were kept within reasonable limits.)

A process for distilling tars obtained from gas works where vertical retorts were used had already been set to work in a neutral country, and the distilled oils were being used on Diesel engines of all sizes and of both low and high speeds with every success, and without the engines being altered for pilot ignition. In most cases, however, pilot ignition had been resorted to in one form or another, and it was only quite recently that any measure of success had attended the experiments made to use the oils without pilot ignition. The chief trouble experienced was that at lighter loads, i.e., below three-quarter loads, the temperature inside the cylinder at the time of opening the fuel valve was not high enough to start and complete the combustion of the main charge.

Mr. JOHNSON referred to an engine of 150 B.H.P., which had been operating absolutely satisfactorily for about three years on ordinary gas works tar. No difficulties had been encountered, and pilot ignition was employed. Several engines had also been tested on distilled tar, and were operating successfully on this product without pilot ignition.

Of the various methods that had been tried for burning tar oils, only two were useful, namely, modifying the design of the fuel valve so as to produce the right conditions for tar oils, or using a pilot charge. The latter was at present the standard for running Diesel engines on tar oil, but the former appeared to be the correct one, as the problem of using tars and tar oils could not be considered solved until such oils could be burned as simply as residual oils. No conclusive results had as yet been obtained, and the whole principle being in its experimental stage, great secrecy was observed. The whole difference, however, appeared to be in the design and operation of the needle valve. What appeared to be required was that quite a small quantity of tar oil should enter the cylinder before, and distinct from, the main charge. This quantity was readily converted into the oil-gas formation necessary to raise the temperature in the combustion space sufficiently to permit of the smooth and complete burning of the main charge. Many experiments were carried out before conclusive evidence was obtained that the experiments were being made on the right lines and that results were possible.

It should be noted that copper, zinc, or alloys of these metals could not be employed in the manufacture of parts in contact with tar oils. Hence steel pipework must be adopted, and the parts of engines, which were generally made of gun-metal or phosphor bronze, had to be made of pure nickel or 25 per cent. nickel steel, while good joints could be made of sheet asbestos after soaking it in gold size or some like substance.

In the discussion which followed, much stress was laid on the advantage which would accrue to users of Diesel engines in this country if they were not in future to be left entirely dependent upon the use of imported petroleum fuel oils. The importance of the question from the national point of view, particularly in the more economical utilisation of the mineral resources of the country, was also referred to.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

CHILE.—Telegraphic information has been received at the Board of Trade, through the Foreign Office, to the effect that the proposed new specific Customs Tariff for Chile has been introduced in the Senate, and will, it is anticipated, be passed by that body very shortly and promulgated as law, in the form sanctioned by the Chamber of Deputies, with some few modifications. A translation of the proposed new Tariff, as approved by the Chamber of Deputies, was issued in 1914 as

a Parliamentary Return (Cd. 7,458), obtainable from Wyman and Sons, Fetter Lane, London, E.C.

TRINIDAD AND TOBAGO.—The Board of Trade have received the copy of a Resolution which was agreed to on December 10th, 1915, by the Legislative Council of Trinidad and Tobago, amending the duties on certain articles imposed by the Customs Duties Ordinance of 1913 on their importation into the Colony. Among the amendments may be noted the following:—

The duty on machinery—including motor and other engines, steam boilers, and electric machinery *not hereunder specified* (see below), and electric dental appliances, remains the same, viz., 8 per cent. *ad val.* under the preferential tariff, and 10 per cent. *ad val.* under the general tariff, but the italicised words are new.

The following have been transferred from the free schedule and now have to pay a uniform rate of 24 per cent. *ad val.*, viz.:—Machinery for electric lighting and power plant on estates or mines (and parts thereof not imported for sale) if admitted as such by the Collector of Customs; machinery for railways and tramways on estates or mines, including rails and rolling stock (and parts thereof, not imported for sale), admitted as such by the Collector of Customs; also agricultural, irrigation, mining, &c., machinery, not imported for sale. Motor vehicles of all kinds, which formerly paid varying specific rates of duty, are now dutiable at the uniform rate of 8 per cent. *ad val.* under the preferential tariff and 10 per cent. *ad val.* under the general tariff.

NETHERLANDS.—The exportation from the Netherlands of rubber, gutta-percha, and articles manufactured therefrom was prohibited by a Royal Decree promulgated on January 26th.

GREECE.—In virtue of a Greek Royal Decree of October 31st last, certain tools, machinery, instruments, and utensils of agriculture and the branches of industry connected therewith, when imported into Greece by Agricultural Associations for their own use or for sale or loan to members of an Association, are to be exempted from import duty, also from municipal, communal, harbour, or any other tax. In the list of implements and machinery specified in the Decree appear the following:—Motors of agricultural machines, i.e., motors worked by horse, steam, or electric power, crude petroleum and benzine (petrol) motors; means for the conveyance of motive power, i.e., belts, cogged wheels, chains and wire for transmitting electric power; and pumps.

UNITED STATES OF AMERICA.—A Circular recently issued by the United States Treasury Department contains the text of revised regulations, which came into force on February 1st, regarding the procedure for the exportation of merchandise to foreign countries or shipped to or from non-contiguous territory of the United States. The full text of the Circular, which gives detailed instructions with regard to various export matters, may be consulted at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

BRITISH DOMINIONS AND COLONIES, &c.—Information relating to the rates of import duty leviable in the British Self-Governing Dominions, Colonies, Possessions, and Protectorates is contained in the Return recently published by the Board of Trade on "Colonial Import Duties, 1915." The Return is arranged with the object of bringing together the various tariff classifications and rates of duty for each principal group of articles, the information being shown for each British Possession under each group. Electrical machinery and apparatus (including wireless telegraphy) forms one of the headings into which the groups are divided. Other particulars included in the Return are details of the preferential tariff advantages accorded in certain Dominions and Colonies in favour of British goods; information respecting tariff valuations, the levying of duties on the gross or net weight of goods imported at specific rates; tare allowances; Colonial copyright laws and regulations; parcel post regulations affecting dutiable articles sent from the United Kingdom; and a detailed statement of the export duties leviable in the various Dominions and Colonies, &c. The Return is obtainable from Messrs. Wyman & Sons, Ltd., Fetter Lane, E.C., reference number Cd. 8,094, price 4s. 2d., post free 4s. 9d.

SOME months ago we recorded the appointment by the Board of Education of the Advisory Council for industrial and scientific research, responsible to a special committee of the Privy Council, and charged with the duty of organising and promoting the investigation of scientific problems bearing on trade and industry, and the elaboration of improved processes of manufacture, with a view to rendering our industries independent of foreign, and particularly German, methods and products. Since then the Council has been engaged in laying the foundations of the organisation which must be erected in order to achieve its purposes, and has made considerable progress, not only in connection with the machinery through which its operations will be conducted, but also in setting on foot a number of researches, with a view to avoiding loss of time—for the matter is of great urgency. We have already announced that grants have been made to the Institution of Electrical Engineers towards meeting the cost of researches on the heating of buried cables, and the properties of insulating oils; similar grants have been allocated to other scientific bodies for specific purposes, and other proposals are under consideration.

The Advisory Council, as originally constituted, comprised only seven scientific members and an administrative chairman; obviously so small a body could not possibly cope with the immense task which lay before it, and the Council has wisely adopted the principal of devolution, in order that full justice may be done to every branch of industry. Strong standing committees of experts in Mining and Metallurgy have already been constituted under the chairmanship of distinguished specialists, and a similar committee will shortly be constituted for Engineering. We particularly wish to emphasise the fact that the personnel of these committees comprises only men who are in the foremost rank in their respective branches of industry and science, and that they have been chosen with the most scrupulous care and circumspection. We may confidently hope, therefore, that the work of the various sections will be directed into profitable paths and will speedily bear good fruit.

In addition to the activities briefly indicated above—which represent a considerable expenditure of time and labour—the Council has obtained particulars of the research work which is already being carried on by the scientific and professional societies, and by the universities and higher technical schools, with a view to the establishment of a register of research and the prevention of overlapping. It is even possible that in the near future steps may be taken to collect information as to the research work of manufacturing firms. We cannot afford to waste energy and money by duplication.

Another important branch of the Advisory Council's work is the training of an adequate supply of research workers, and though it is impossible during the war to make much progress in this direction, the Council is very much alive to the urgency of the matter, and has made recommendations for immediate action, in order that whatever can be done shall be done. The University of Oxford, acting independently, recently took steps to ensure that honours students in chemistry should be obliged to take up research work, and no doubt this excellent example will be followed. It may be hoped that we

are on the eve of fundamental changes in our educational system—changes long overdue—which will inevitably include the elevation of science to the position to which it is justly entitled in the education and training of those who are destined to be the nation's leaders in art, industry, and administration.

The Voice of Australia.

For some months past we have followed with great interest the speeches that have been delivered in Australia by the Prime Minister of the Commonwealth. Quite early after the outbreak of war he recognised the strength of the bands which Germany had been winding around the resources of the British Empire, and he determined that, so far as Australia was concerned, those bands should be snapped. The policy adopted in the Empire's hour of emergency was developed as the needs of the situation became more clearly defined, and most thoroughly has such policy been applied with a view to ridding Australian industrial, economic, and public life of the last vestige of German influence wherever it was recognisable. Readers of this journal have been kept cognisant of the main features and progress of the movement. Australia needed a strong man for the emergency, and he was at hand in the person of Mr. W. M. Hughes, and when they found that their strong man was prepared to act they backed him up in practically everything that he did. He is not a man to employ half-hearted measures. Was he not first and foremost a Labour man? A Democrat of Democrats, and therefore an out-and-out Autocrat? The records of the application of his policy have shown that he and his supporters prefer to act too drastically rather than leave danger lurking beside the pathway. It was in the interests of the Empire and of the Allies, as well as of Australia, that the metal industries were freed from the Teutonic entanglements in which they had become so enmeshed, and what was done in the case of those industries led also to the strangling of many another concern in which German influence was discovered. It had been supposed that when Mr. Hughes reached the Mother Country he would have obtained another view of certain matters, but the speeches that he has delivered here during the past fortnight have all the invigorating influence and force that marked his progress as he pushed aside whatever opposition came in his way in the Commonwealth. In the main, the speeches that have been stirring the people here are similar to those delivered in Australia—we detect no relenting tendency. He wants us to know that the daughter heart of Australia beats with the heart of the Mother Country in her hour of need, and that the sword of her sons is whetted to slay those who are a menace at our threshold. He wants us to recognise that the material resources of the Empire should be so organised and controlled that that Empire shall be independent of those who aimed to dominate it. He wants us to see that what Australia has done is but the beginning of what the whole Empire should do in order to prevent future economic domination by those with whom we are at war. We welcome his speeches as much because they have come at the psychological moment as because of their invigorating spirit and strength. We learned before he came that he had some very plain truths to utter in our midst. Certainly the beds of some of our legislators must be a little draughty in these breezy days. If Mr. Hughes were to remain here we might hear less of the wait-and-see murmurings; there might be some mistakes made; the fat might be more frequently in the political fire; but we should not be told one day of Germany's head or helmet being safely under never to rise again, and on another hear the disappointing assurances that we shall arrive at and depart from the great Economic Conference at Paris

entirely uncommitted to any future trade policy. Mr. Hughes sees the danger of putting things off, and on behalf of the great Commonwealth that he represents he asks us to proceed to effectively, systematically, and scientifically organise the resources of the Empire and deal *right now* with a number of after-the-war trade questions. "To wait until the end of the war is to play directly into the hands of our enemy, to help him to keep up his national spirits." "To delay the public declaration of what our trade policy is to be is to make the work of attempting to eradicate German influence in our midst infinitely more difficult and to make any radical change after the war impossible." "This is our hour, our opportunity, which being let slip, will pass for ever." Mr. Hughes holds that if we acted promptly and definitely the Allies would follow our lead, and our organised economic menace, added to our strengthened military and naval resources, would cause German credit and confidence to topple like a house of cards. We hope that when Mr. Hughes has left these shores we shall not slumber again, but shall find that among the statesmen in the Cabinet there are some who will show their colours and speak out. Has not the Minister of Munitions completed his great work?

Rubber.

FLUCTUATIONS in the price of crude rubber within the past few weeks were much more restricted than in the course of the previous month, the market having displayed a degree of stability which has helped in keeping the demand from consumers on a very satisfactory scale. In these days of precarious shipping or fears of vessels carrying rubber being interfered with by hostile cruisers or seriously delayed in reaching their destination, manufacturers are obviously more inclined to provide for their needs well ahead rather than to run the risk of being caught short of the commodity. For this reason, there is ground for believing that consumers hold a fair amount of stock as a safeguard, which is, moreover, quite in keeping with the enormous consumption going on.

Rubber continues quite a free market, and contrary to the rumours circulated recently, the Government is hardly likely to interfere with trading in this commodity as has happened in most metals, with a view to eliminating speculative transactions. In any case, the price of rubber does not appear to be unduly high, and it is chiefly determined by the progress of the legitimate demand, and not so much by the attitude of dealers. The price of fine plantation rubber fluctuated so far this year between about 4s. 3d. and 3s. 1d. per lb., and has again improved to about 3s. 9d., though this has been followed by another setback just lately of a few pence per lb. due to a more conservative demand from consumers, and a little more pressure to sell on the part of dealers who were tempted to nurse a little stock owing to apprehension as to the delayed arrival of a big cargo, which was anxiously awaited, but has since been reported. The market is thus once again in a pretty comfortable position, and although there is no eager demand for the time being, the run of business continues moderately good, and the deliveries are making satisfactory progress. There is, at any rate, no serious accumulation of stocks, while the discharge of vessels is usually much delayed through lack of labour. The progress of consumption has been really wonderful.

War requirements have undoubtedly materially contributed to the much greater activity of the manufacturing trades in allied countries, but the huge increase which has taken place in trans-Atlantic trade requirements has been provided the most important factor in market developments within the past year, as indicated by the huge swelling of the shipments to American ports from this side and Eastern centres direct, as well as from Brazil. It is estimated that the world's production for the past year was, roughly, 150,000 tons, two-thirds of which represented plantation grades, and the other third wild rubber. The plantation output must be expected to show a further big increase this year to at least 130,000 tons, but the chances are that the surplus will be steadily absorbed by the ever-increasing outlet, provided prices are not unduly raised.

THREE-PHASE EXTENSIONS AT BURNLEY.

REFERENCE was recently made in our pages to the inauguration of three-phase plant in connection with the Burnley Corporation electricity undertaking, which has developed

FIG. 1.—TURBINE PLANT AT BURNLEY; NEW PLANT ON THE RIGHT.

beyond the limits of economical direct-current distribution for industrial purposes.

As previously mentioned, the new plant consists of a turbo-alternator with rotary converters and switchgear at the generating station, and rotary converter equipment at a new sub-station which has been erected at Holmby Street, in a part of the town where the load is rapidly developing. Through the courtesy of the British Westinghouse Co., the contractors for the new equipment, we are enabled to publish some views which will indicate the position of affairs.

Fig. 1 shows the new turbo-alternator, which has an output of 2,000 kW. at 6,600 volts, and generates three-phase current at 50 cycles, its speed being 3,000 R.P.M.; beside it is a 1,500-kw. tandem direct-current turbine set installed in 1909, the two turbine units being sandwiched in between older high-speed reciprocating direct-current sets.

The new turbine is of the Westinghouse-Rateau impulse type, operating on steam at 160 lb. pressure, superheated 100° F., and it exhausts into a Westinghouse-Leblanc surface condenser plant, of which a feature is the turbine-driven auxiliary set, consisting of Leblanc air, extraction and circulating pumps coupled direct to a 90-B.H.P. impulse turbine running at 2,500 R.P.M. This auxiliary turbine is supplied with boiler-pressure steam and exhausts into the main turbine through a back-pressure valve.

The turbo-alternator and auxiliary plant are designed for a 25 per cent. overload for two hours.

Fig. 2 shows the rotary converter plant installed at the power station, and occupying a position under the high-tension switchboard gallery (which is not visible in the view).

These machines, two in number, are each designed for an output of 600 kW., six-phase, converting from 370 volts A.C. to 460/500 volts D.C. (shunt) or 500/550 volts D.C. (compound), and can supply either the lighting or traction load in parallel with the older plant.

Each machine has an exciter and booster mounted on the shaft and a starting motor can be added later, but at present the machines are started from the D.C. side; three diverters are also provided, one across the interpole winding for traction supply, and two for use when on lighting load, one being across the reversed series winding.

The starting is done through five point switches connected to starting resistances; a throw-over switch on the machine provides for changing over the D.C. supply. The machine shafts are fitted with oscillators, and the transformers are of the oil-immersed self-cooling type, each of 700 K.V.A. capacity.

The H.T. switchgear is of the cubicle pattern, with oil switches electrically operated from controllers of the loose-handle type, mounted on the switch panels on the gallery; in addition to the turbine set and converter transformers, two outgoing 1,000-kw. feeders are controlled from this board.

In the case of the oil-switchgear, the three-phases are kept separate, and this practice is followed throughout the structure; two sets of bus-bars are also provided, with a coupling switch for use as required. Inverse time-limit overload relay

FIG. 2.—ROTARY CONVERTERS AT BURNLEY ELECTRICITY WORKS.

FIG. 3.—INTERIOR OF THE HOLMBY STREET SUB-STATION, BURNLEY.

and reverse power relays are provided on the turbine and converter circuits, and overload relays on the feeders.

The same gallery contains the traction switchboard, which, in addition to the generator feeder circuits, also provides for the traction supply from the new converters.

Fig. 3 illustrates the interior of the new Holmby Street sub-station, which is equipped with two 300-kw. rotary converters and the necessary transformers; the converters are equipped with induction motors for starting, the connections employed being those of the Westinghouse self-synchronising method. The machines are arranged to supply either the lighting or traction bus-bars.

The a.c. oil switchgear is of the mechanically-operated type, the switches being mounted in cubicles behind the control panels as shown in the view, and controlled by time-limit overload relays. The direct-current switchgear for the converters, and lighting and traction supply is generally similar to that installed at the power station, but only reverse-current relays are provided in the converter circuits.

We are indebted to Mr. Starkie, the borough electrical engineer, and to the British Westinghouse Co., for the particulars here given.

THE RESISTANCE OF A CUBE.

By F. W. CARTER.

THE problem of the resistance between opposite corners of a cube of sheet metal referred to in your issue of February 4th appears still open to discussion. The reason of this is, perhaps, that the problem, unlike that of the cube of wires, is an indeterminate one, not only as regards the manner in which the resistance of a side should be taken, but also as regards the resistance of the cube itself. If the resistance of a side be taken to mean that between opposite edges, then the only definite meaning that can be ascribed to the resistance of the cube between opposite corners is the theoretical one, which makes the resistance infinite. If, on the other hand, the resistance of a side be taken as that between its opposite corners, as surmised by Mr. A. J. Makower, in your issue of March 3rd, then this resistance itself is theoretically infinite and practically indefinite, so that it cannot well be given the value 1 ohm.

The problem of the flow of current between opposite corners of a square plate is familiar to mathematicians, and can be solved completely in terms of inverse elliptic functions. For the present purpose, however, it is not necessary to attempt a complete solution if the assumption be permitted that, close to the corner, the current flows in radial lines from or to the corner, so that the equipotential lines near to the corner are quadrants of circles. Let the resistance from the corner to a certain small radius x_1 (see fig. 1) be R_1 , at each of the corners to which leads are attached, and let the resistance of the middle portion of the plate be R_2 . The total resistance of the plate is accordingly:—

$$R = 2R_1 + R_2.$$

In this equation R_1 refers to an area containing nothing of a singular nature, and is accordingly finite. With regard to R_2 , however, if t is the thickness of the plate, and ρ the specific resistance of its material, the resistance of the portion between x and $x + dx$ is:—

$$\rho dx \int_0^1 \frac{1}{x} dx,$$

hence the total resistance between radii x_1 and x_2 is:—

$$R_1 = \frac{2\rho}{\pi t} \int_{x_1}^{x_2} \frac{dx}{x} = \frac{2\rho}{\pi t} \log \frac{x_2}{x_1}.$$

At the corner x_1 is zero, and R_1 is accordingly logarithmically infinite. In practice this is to be interpreted that the resistance of the plate, as measured between opposite corners, depends on the precise form of the corners, and on the size, shape and nature of the contact of the leads which bring the current to the plate. In other words, there is no definite value other than infinity that can be assigned to the

resistance in question. For a similar reason, the only value that can be assigned to the resistance between opposite corners of the cube is a logarithmic infinity, and practical measurement would yield indefinite results.

The distinction between the present problem and that of the wire cube is that in the latter the conductors are conceived as of one dimension, and, accordingly, the leads may be supposed to enter at a point. In the present problem, however, the conductors being of two dimensions, the current should enter along a line; for example, a definite

FIG. 1.

FIG. 2.

value could be assigned to the resistance between pairs of opposite edges of the cube. Similarly, in a three-dimensional problem, the current must enter over an area if the resistance is to be finite.

With regard to the problem of the cube of wire, the author, recently looking over some lecture notes, taken at Sir J. Larmor's lectures more than 20 years ago, came upon the same problem, and as the solution was conducted with a total absence of verbiage and terminated with a valuable bit of advice, it may be worth reproduction here (see fig. 2):—

$$“\frac{1}{3} + \frac{1}{3} + \frac{1}{3} = \frac{1}{3}.”$$

Tip.—Always make the most of symmetry.”

LEGAL.

TYRELL v. SMITHFIELD MARKETS ELECTRIC SUPPLY CO., LTD.

In the City of London Court, on Monday, this case was mentioned. Plaintiff, Mrs. Tyrell, widow of Edward A. Tyrell, made a claim against the defendants for compensation under the Workmen's Compensation Act for the death of her husband, who was an assistant engine driver in the defendants' service. He met his death on February 7th while working at Smithfield Market, and was 38 years of age. He left a widow and three children. Defendants paid £300 into Court, and as that was the full sum which the plaintiff could claim, the amount was accepted. Judge Atherley-Jones, K.C., in sanctioning the settlement, apportioned the money between the widow and the children. Mrs. Tyrell said she wanted the Court to invest the money in War saving certificates, as in consequence of her husband being insured she had money in hand to last for some time, and she intended to try to earn her own living. Defendants had been paying her late husband's wages to her in full since his death. Mr. G. A. Powell attended on behalf of the defendants to explain matters on plaintiff's behalf. Judge Atherley-Jones thanked him for his kind assistance to the widow, and ordered the investment of the money as suggested.

TELEPHONE DISPUTE.

THE Postmaster-General sued the Arsenal Football Club, Ltd., Avenell Road, Highbury, in the City of London Court, on Tuesday, for £4 2s. 6d. telephone fees. The case for the Postmaster-General was that the Woolwich Arsenal Football Club, Ltd., signed a telephone agreement six years ago, and that the present defendants took over the telephone two years ago. They had paid the rent, and then the service was disconnected because rent was left unpaid, and the Postmaster-General now compromised his claim for six months' notice by suing for a quarter's rent in lieu of notice.

DEFENDANTS' solicitor said that the defendant company had never been asked for any agreement, nor had they ever signed any. They had had no benefit for the period sued for. The Postmaster-General could not claim under an assumed contract.

JUDGE RENTOU, K.C.: The company that signed the agreement is wound up. Another company has informally taken over the telephone and occupied the premises, and paid for two quarters. It was cut off through the non-payment of rent. That happens to all of us sometimes through being away or overlooking the notice of payment. It happened to me once. There is no defence here. Judgment for the plaintiff, with costs.

CONTINUOUS CURRENT RAILWAY MOTORS.

At a meeting of the MANCHESTER LOCAL SECTION of the INSTITUTION of ELECTRICAL ENGINEERS, on March 8th, Mr. E. V. PANNELL's paper on "Continuous-current Railway Motors" was read and discussed.

The CHAIRMAN, Mr. B. WELBOURN, said that some exceedingly valuable experimental work was being conducted in the United States, which would probably have considerable influence on the character of the electrification of railways to be carried out during the next few years.

Mr. T. FERGUSON said that in describing a typical urban heavy railway service the author had emphasised the desirability of minimum weight. This was a most important point, and deserved much closer attention. In countries where coal was expensive, for instance, in the Argentine, the annual cost of carrying an extra ton of equipment on a city and suburban service might easily reach £10. The adoption of a motor equipment consisting of two large motors, rather than four small ones, had much to recommend it, and for an urban service it might pay to adopt an acceleration of about 1 m.p.h. per second rather than 1½ m.p.h. per second, in order to use a two-motor equipment. The saving in the cost and weight accruing from the use of the two-motor equipment was great. It was good practice to adopt the largest motor applicable to standard wheels, having due regard to preserving sufficient clearance above rail level and below the car floor, as with increase of traffic there was an invariable tendency to push up the schedule to the utmost limits of the motor capacity. He preferred separately-driven blowers to fans, as the volume of air and, consequently, the continuous rating of the motor was considerably increased. The author stated that for frequent stopping service involving rapid acceleration the non-saturated field was preferable. However, it was to be borne in mind that the non-saturated motor was heavier than the saturated motor of the same speed. With short runs it was generally better to employ the material in making a low-speed motor in order to avoid rheostatic losses during acceleration—assuming, of course, that it was not possible to make a further increase in the gear ratio. Each case required a very careful study of conditions.

Mr. J. S. PECK said that the ventilated design had not been introduced extensively into this country, but as tramway systems increased and railways were electrified it would certainly be adopted. A great trouble with the old design of motor was the unprotected ends of the armature windings, which accumulated dust. Modern designs enclosed the whole end winding in a canvas cover, also, the ducts inside the armature had been eliminated, or placed so that they could not possibly damage the insulation of the coils. In many armatures the insulation at the end of the slot had been reinforced, so that the coil was protected at its weakest point, i.e., where it left the core. Large modern motors were insulated practically throughout with mica and asbestos, which ensured good insulation even when the machine was run at temperatures exceeding 100 deg. C. It had taken a long time, even after the introduction of the commutating pole, to produce a motor which would operate satisfactorily even at 1,200 volts, and the majority of railway engineers of to-day would probably hesitate to accept 1,800 volts on a four-pole motor of ordinary construction.

Mr. J. FRITH sounded a note of warning against the constant temptation on the part of manufacturers to make use of the fact that commutating poles had taken away sparking, in order to force up the volts per commutator bar, and, at the same time, to take advantage of the possibility of speed regulation, in which case, with the weakened field, all the volts would be crowded on half or even less of the bars between brushes, and the flashing-over trouble would again appear. One point in favour of the self-ventilating motor as compared with the separately ventilated machine was the ease with which the air could be made to proportion itself correctly between armature and field coils.

Mr. W. C. SCHACHER said the one-hour rating, which was universally adopted, urgently required revision. This method was adopted originally when motors were much heavier for a given output than to-day, and when ventilation, as applied at the present time, was practically unknown. Conditions had entirely changed, and in the modern motor not the slightest relation existed between the one-hour rating and the possible continuous output. In computing the value of a modern motor from the capacity point of view, which was really the determining factor, the continuous rating in k.w. at, say, half or three-quarter voltage appeared sufficient; to judge it from the service point of view it was certainly necessary to have either its characteristic at hand or at least three or four points of the curve. Considerable progress had recently been made towards increasing the diameter of motor coach wheels, and diameters of 42, or even 43½ in., were adopted. Regarding ventilation, the multiple fan or parallel system had undoubtedly many advantages over the older systems, as by this method the cool air came into contact with both field and armature. The author's diagram showed the flow of air in the direction from the pinion to the commutator, which, presumably, required a fan at the commutator end. This method had the advantage that carbon or copper dust would be ejected from the commutator without going through the machine; but, on the other hand, it had been

found extremely difficult to mount a fan at the commutator end, and the speaker had never encountered a construction with the fan in this position.

Mr. H. ALLOOCK thought the paper would serve to accelerate the more general adoption of direct-current electrification at pressures higher than 600 volts, and progress should be rapid in view of the substantial economies due to smaller currents and reduced cost of sub-station plant, which had already been established in connection with high-voltage working.

Mr. W. A. BARNES referred to the author's statement that the average conditions for urban and suburban railway service were trains of 150 tons running at a schedule speed of 15 miles per hour, with two stops per mile. The conditions were very different, however, on "surface railways," especially in the case of electrification of existing steam railways. The average distance between stops could be taken approximately at one mile with a schedule speed of 25 to 30 miles per hour, and in consequence of the heavy duty the weight of a five-car train was increased to 200 tons. Rapid acceleration and retardation, with consequent low ratio between maximum and average speed, was necessary on busy suburban lines if the required headway was to be maintained between trains, and the number of trains per hour increased to meet traffic requirements. These conditions seriously affected the design of railway motors. Four motors per motor-car were necessary in order to secure the requisite adhesion, and each motor would be of about 200 h.p. No revolutionary changes in principle, but rather refinements in design, were required for the high-voltage motor. The 200-k.w., 1,200-volt motor shown in section in the paper would require considerable modification before it could be run successfully. The author had stated that the commutator on a 1,200-volt motor was only that of a 600-volt motor of similar power; the point affecting the design was not the length of the copper bar on which the brushes rested, but the length of the commutator casting, and when the requisite leakage distances to earth were allowed, the difference in length for the two voltages was very slight. It was bad policy to bring in the ventilating air immediately over the commutator, as the brush gear necessarily formed pockets in which grit and dirt might collect. After long experience with the split-frame type of motor the Lancashire and Yorkshire Railway Co. had discarded them and introduced the solid frame. In order to improve what might be termed the space factor under the cars, the main pole-pieces had been placed horizontally and vertically instead of diagonally. This necessitated more carefully designed bearings in order to obviate the possibility of the armature dropping to the bottom pole piece. The principal details of the 1,200-volt motors in use on the Manchester-Bury line were as follows:—

Efficiency (including gear)	87.5 p.c.
Current (amps.)	140
Speed (full field)	500
Speed (short field)	600
Gear ratio	59 to 26
Diameter of car wheel	43 in.
Weight complete	7,800 lb.

* ARMATURE.

Diameter	21.75 in.
Gross core length	15.00 in.
Total conductors	708

COMMUTATOR.

Working length	4.125 in.
Diameter	20 in.
Number of segments	353

The above motor was able to give a schedule speed of 28 miles per hour, excluding stops on a section of line with very heavy gradients, and stops 1.3 miles apart.

Mr. ROGER SMITH, speaking from the general railway point of view, said the author's minimum acceleration figure of 1½ miles per hour per second was too high; one mile per hour per second was about the lowest that should be asked for. The author had confined his remarks to the series motor with "wheel-barrow suspension" and single-reduction gear. Such a motor was quite useful for suburban railway service, and also for goods locomotive working, provided the general speed of the motor train or goods locomotive never exceeded 60 miles per hour, but above this speed single reduction gear could not be used. The plain series motor had the great disadvantage that it was a one-speed motor for a given load. The series motor locomotive was not yet comparable with the steam locomotive at speeds at which everybody's troubles began, i.e., speeds above 60 miles per hour. The output at high speeds of the series motor fell off very sharply, but for everything in view in this country in the way of railway electrification, i.e., suburban and goods working, the series D.C. motor with single-reduction gear was a most satisfactory piece of apparatus now that commutating poles and field control had been established. Field control was one of the two features recently introduced which made the D.C. motor more acceptable for railway work. The other feature was regenerative control, which was being successfully applied in the United States on more than one electrified railway using D.C. series motors. If, as he believed, something less than half the energy wasted in stopping a train, due to the application of the brakes, could be returned to the supply by regenerative control, economies in suburban working which were badly wanted would become possible. Much depended

upon the various railway companies standardising supply voltage. The Bury-Holcombe Brook line used 3,600 volts, Manchester-Bury 1,200 volts, and the North-Eastern Railway 1,500 volts. These experiments at different pressures would ultimately lead to the choice of the most suitable high D.C. voltage to suit the general average conditions of this country, and the railways would have to adopt it uniformly. The advantages of field and regenerative control could not be realised if several different supply voltages existed. It was well to emphasise the danger of comparing motors on their one-hour rating only.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The Cube Problem.

I was reading in the ELECTRICAL REVIEW of a week or two back an article respecting the resistance between the opposite points of a cube.

The conditions most simple under which to consider this matter are that the cube is balanced on one of its corners on a plane surface of an electrical conductor, and on the top corner of the cube shall rest the plane surface of another conductor.

The question is, what is the resistance between the two conductors above-mentioned, it being assumed that the resistance of such conductors is negligible? This being a pure mathematical matter, nothing but a perfect cube can be taken.

The corners of a cube are points, a point has no dimensions, hence, it is not possible for current to flow from one of the conductors to the cube or out again because the area of the cube at the point of contact is zero. Therefore, the resistance is infinity.

From a practical point of view, if an electromotive force were applied between the two conductors mentioned, a current would certainly flow, first because the corners of a manufactured cube would no longer be points, and secondly if they were nearly so the electrical pressure would cause current to jump across between the surfaces of the cube and conductors which were immediately adjacent to the points of contact, and the higher the voltage the more such surface would come into play.

It would appear, therefore, that in order to discuss this matter at all from the point of view of Mr. A. J. Makower, M.A., in yours of March 3rd, a portion of the corners of the cube would have to be cut off in order to get a start; it does not matter how little as long as the amount is defined.

David Smith.

Torquay, March 18th, 1916.

It was because of the impossibility of dealing with the corner difficulty that we said, some weeks ago, that the problem was indeterminate. See Mr. F. W. Carter's article on p. 332.—Eds. ELEC. REV.]

Business Methods Which Must Go.

I think Mr. Jacobs in the above article more correctly defines the real method by which our lost trade may be recaptured.

It would seem that Britain has resolved itself into a copyist nation, waiting for someone to lead. Speaking of the electrical trade, if one follows the patent and new appliance columns of your paper he will be distressed to see that the greater percentage hail either from Germany or the United States, because of the reasons in many ways explained in the above article. It seems as though any old thing at all, so long as it hails from either Germany or the States, is assured a ready sale in Britain because the foreign article is cheaper, more profitable for the seller, better advertised, and usually more up-to-date.

Anyone who has had such dealings with American firms as Mr. Jacobs describes can vouch for their willingness to give any new method, or idea, a trial free of charge to the inventor, and they won't try to rob him.

How can any nation claim to be progressive that stifles all initiative preferring to wait till our friends, the foreigners, have got the market? All the talk of trade unions ever holding the hatchet over the manufacturer's head, is all due to the latter's fault. Piecework is the progenitor of all evils connected with trade unions, and what is piecework but robbery? The masters are for ever seeking to cut down wages instead of spending more money in going further afield for their business, and studying their market wants. Ask the British Admiralty the net result of their premium bonus system. The same had to be abandoned, not because it did not increase the output, but because the quality fell a much greater proportion than the output increased. Workmen on one hand scamp their work to make a little extra money, whilst on the other the masters seek to cut down the price; hence the distrust of one another.

It has never been satisfactorily explained why American

firms can pay their workmen 100 per cent. more wages, pay more for their raw material, more taxes, yet sell an article cheaper in Britain, or any other country, than the British manufacturer. One can only conclude that it is due to better organisation, better business methods, and at all times striving to attempt something new, giving every facility for new ideas to be developed.

Canada is overwhelmed with American goods, from a generator to a lamp socket. One scarcely ever sees anything British; yet they have to pay 5 per cent. higher tariff. It costs no more to keep British travellers in Canada than in America. One can only put it down to the British manufacturers being too stingy to pay them, preferring to moan and bewail the fact that they can't compete because of the high duty. Whilst a tariff may be necessary to prevent foreigners dumping their surplus stocks, no tariff ever imposed will alter the case for the British manufacturers. Let them organise themselves and set out with a firm determination to use every means known and unknown to get their share of the world's market, treat their workmen as human, not machines, drop the throat-cutting business amongst themselves, and use every endeavour to cut the throat of German and American competition; the latter are no more our friends than the former.

It is quite refreshing to read of the new arc-incandescent lamp being the result of British research, and it is to be hoped that it will prove a success and be the forerunner of many other new developments.

W. E. L.

Canada, February 24th, 1916.

[Apparently "W.E.L." is referring to the article by Mr. John Marks (not Jacobs), in our issue of December 24th, 1915.—Eds. ELEC. REV.]

What to do with Our Canals.

Under the above heading in your issue of the 10th inst. was an article by Mr. W. N. Stewart, proposing to convert canals into motor roads, but I venture to suggest that, without some better backing than the arguments used, the heading to his article needed the insertion of the word "not."

I admit straight away that for delivery for short and medium distances from door to door, conveyance by electric motor may be an economical and useful method of transport, but must respectfully submit that, because of that, to destroy our whole canal system would be a suicidal act, in view of what canal transport has effected in other countries. Sir William Lindley, certainly an engineer of repute, was able to report, upon making inquiries for the Royal Commission in 1909, that the cost of water transport in France had fallen 50 per cent. in the last 50 years. Has any such result followed any form of traction in England, when account is taken of the cost of the road, whether it be rail, water, macadam, or tarmac?

Next, I submit that your correspondent's argument is founded on absolutely false premises when he suggests that if our canals were drained they could be adapted as trunk motor roads at a cost of £800 per mile. If he will obtain estimates and go carefully into the matter, he will find that the cost would approach ten times the amount he named, or, say, £8,000 per mile, which coincides with the figure which the writer, with elaborate sarcasm, suggested has been recommended by the Royal Commission as the cost of installation of a system of electric haulage on canals, giving a speed of two miles per hour. I defy him to cite evidence from the Report of the Commission to substantiate this suggestion. They made no such recommendation.

Be that as it may, however, your correspondent has yet to square with his own dictum—that the cheaper power must be used—to prove that it requires less power to haul on a waterway than on a motor road.

Frank Impey,

Secretary, The Waterway Association.
Birmingham, March 18th, 1916.

The Engineer and the Commercial Manager.

One would think from the recent articles on the subject that the interests of these two classes were opposed. Is it not the question of Capital versus Labour in a rather different form? The commercial department represents the views of the capital in that the only consideration of any account is the dividend of the company, while the engineer at heart believes that the commercial department is only little better than a necessary evil. The discrepancies in responsibility and salary seem to be generally admitted, the works manager and staff being paid less than the members of the commercial section, while hardly anyone would support the statement that the responsibilities were in the same proportion.

The works manager may not have to sell the output of the factory, but he has to buy all the material, handle the whole works staff and men, estimate the cost of all new articles to be made, and keep his works costs down by improvements in designs and methods of production, so that the firm can meet all competition in the open market. At the same time he often finds it almost impossible to persuade the board to devote new capital to the most necessary improvements or extensions. From the works manager's point of view the commercial side only have to add to the works cost a figure to represent the selling costs and profit, and find the cus-

tomers to buy the manufactured article. The commercial department's reply is to the effect that without that department the whole business would stop. An exact parallel to the capitalist, who says: If we did not find the money there would be no work.

What the two departments have got to learn is not only that both are needed, but that any friction or misunderstanding between them is inimical to the trade of the country.

We have recently had bonfires which have told us that the engineer is not a business man, and that he is not best qualified to sell his own goods or to describe them to his customers. Are these statements true? The main fact that seems to have been overlooked is that the average customer who is ready to buy the productions of an engineering firm knows more about the article he wants than the average representative sent out to interview him. Any engineer buyer in a large firm will confirm this statement, and it is probable that more engineering firms fail to make good because their commercial men are not engineers, than because their engineers are not sufficiently commercial in their experience.

We have had examples of how incapable even a chief draughtsman may be in dealing with a customer. This case is probably one due to want of proper training in younger days, and the effect of having been compelled by his commercial department to draw out schemes which he knew were inefficient, because the representative who had interviewed the customer had not had sufficient engineering training to grasp the problems of the case. If this is not so, how do so-called "wild cat" schemes originate and waste the time, patience and ability of the chief draughtsman? It would be very easy to give examples of the mistakes of the commercial section apart from any individual failings.

For example, ask a purely commercial traveller if he would not be just as happy with an order for one article at £1,000 as with an order for 100 articles at £10 each. Which order would the works manager prefer? Then, one other point. The traveller who is only a traveller, and not a trained engineer, is always afraid of exposing his ignorance, and also very prone to make impossible promises. How many orders are taken on promises of delivery in less time than the works department give as the minimum possible? The works are sometimes heavily handicapped by insufficient, and possibly misleading or incorrect, particulars being obtained by the non-technical staff who interview the client, and finally, when some difficult point requires explanation, the non-technical traveller is more likely to think the client's view reasonable because it appeals to him more than the technical one, which his training is not sufficient to appreciate.

For true harmony to exist between the manufacturing and sales departments, it is therefore essential that the sales manager shall have a sufficient engineering training to avoid all these difficulties, and this fact is beginning to be more recognised. The weakness of the purely commercial man's position is practically confessed in these attempts to justify the treatment to which the engineer is frequently subjected.

H. Gee.

March 14th, 1916.

Concerning Discounts.

With reference to the comments of "Central Station Engineer" on the above in your issue of the 3rd inst., I herewith attach a portion of a discount sheet for your inspection, which goes to show that the members of this Association have been fully alive to any convenience that is to be attached to the use of equivalents and coefficients of various discounts in use.

W. C. Fisher,

Secretary, The Tungsten Lamp Association.

London, E.C., March 15th, 1916.

[The sheet issued to clients by the T.L.A. is admirably devised to solve the whole difficulty, by giving the discount which is equivalent to various successive discounts, and also giving the coefficient for use with the slide-rule, &c., enabling the net price to be arrived at by one operation.—EDS. ELEC. REV.]

Not being an accountant, and considering their ways "past finding out," I do not wish my name mentioned in connection with the correspondence appearing in your columns "Concerning Discounts," but sincerely trust you will spare no effort to get these apparently absurd complications of discount eliminated. We have recently been quoted prices for cables with no fewer than five sets of percentages, + and -. Personally, this does not trouble me much, as I reduce them to one percentage and use my slide rule; but it wastes endless time amongst my clerks. I quite fail to understand why contractors should not be quoted one single figure discount other than the extra 2½ or 5 per cent. cash discount, which is desirable as a stimulus to prompt settlement.

In normal times list prices could be adjusted to make this discount one of the following simple figures, 13, 23, 5, 10, 20, 25, 33½, or 50 per cent., thus often avoiding the necessity of reference to discount tables.

When this could not be done, if manufacturers quoted single odd figures rising by 2½, such as 37½, or even rising by 1 or 1½, it is quite certain there would soon be plenty of discount tables available to deal with such figures, and, though they

would be a little more bulky, the benefit of only one reference would soon be felt, especially if the book of tables were thumb-indexed judiciously.

The preceding paragraph would under any circumstances apply to exporters, factors, and other specially favoured dealers.

Contractor.

Track Circuits and Cab Signals.

Lieut.-Col. von Donop at last admits that the track circuit "would undoubtedly have prevented" the Jarrow wreck. But he never condemned the fact that there was *no track circuit at the place on the North-Eastern Railway*. Seeing that the track circuit ought to have been in use at Jarrow, and everywhere else 20 years ago, and that much less than half of the British railways are even now equipped with track circuit, Lieut.-Col. von Donop's report is exceedingly inaccurate. The fact is that the track circuit is being very scarcely adopted by the railway companies.

The Board of Trade inspectors will know that the railways would continue to have fatal wrecks in the absence of a proper cab signal, even if the track circuit were universal. A proper cab signal or the track circuit is not good enough; a cab signal and the track circuit is the least requirement.

The Board of Trade report never recommended the well-known dual necessity. The three inspectors never recommended a proper cab signal. They only went so far as to favour the cab signal for a distant, although it has been publicly known that such a cab signal is exceedingly inadequate. The North-Eastern has only a very improper cab signal, and at the scene of the Jarrow wreck no track circuit at all. Why does Lieut.-Col. von Donop fail to denounce the railway company?

Safeguard.

What is an "Electrical Contractor"?

With reference to the letter in your issue of March 10th from "Facts," I do not think that this gentleman is an electrical contractor, otherwise he would not write in the strain he does. If he had been a wiring contractor he would have known that although the ranks of the electrical contractors may number a good many firms who from their training are only competent to carry out work in connection with the wiring of houses, yet it cannot be denied that amongst the electrical contractors of the country there are many who specialise in the erection of separate installations such as country-house installations; and there are firms amongst these who employ such a staff that they do not require any assistance whatever from the manufacturers in the fixing of the engine, dynamo, or accumulators which go to make up the complete plant, and it was in speaking for firms like this that my letter particularly mentioned the point to which he takes exception.

I may preface my remarks by saying that in my own case the works I carry out are my own design in every detail, down to the buildings themselves; they are erected throughout by my own workmen under my personal supervision, and I am not in the slightest degree dependent upon any manufacturer to supply me with any information, except such detailed drawings as every manufacturer sends out with his goods, even for his own workmen's satisfaction.

I have, therefore, cleared the ground of the imputation which he makes.

He does not appear to appreciate the point of view that the wiring contractor would take up with regard to the question of contracts. To give you an instance of what one point of view would be: suppose a wiring contractor carried out the wiring only of a country house installation, and the machinery was supplied direct by the manufacturer; assuming under these conditions that the plant portion of the work is a failure, who gets the blame? Why, the wiring contractor, of course, and afterwards the owner of the place, if asked who did his electrical installation, will say that So-and-So did it, but he cannot recommend him, as his work was faulty. I am speaking from experience, so for this reason will only carry out whole contracts.

In my opinion, one of the reasons why almost everybody knows so much about trade discounts in the electrical business is due to consulting engineers including prime cost sums, which they say must be the actual net trade prices, and, consequently, all the business in the electrical trade is made public property by everyone who ever has a specification drawn up on these lines; and when they find that the first fitting manufacturer they go to says that his discount is 50 per cent., they usually come to the conclusion that every fitting manufacturer's discount is 50 per cent., and presume that the wiring contractor gets 50 per cent. profit for doing nothing. I wonder how many of us can say that we sell fittings at this profit? I venture to say that it would be a very small proportion that could say they ever got a profit of this kind.

Another point is that in installation work customers expect a tremendous amount of attention in laying the actual wires, and no wiring contractor is adequately paid, for this very reason; whereas, as regards the purely engineering part of the concern, there are seldom any questions asked by the customer, because he is not able to ask them, as he knows nothing whatever about this part. For the sake of argument,

a man can carry out with a minimum amount of trouble to himself an engineering detail which might cost £1,000, but he is put to endless trouble and visits for work which might cost £250, and at the finish the portion of the work to which the most attention has been paid will not be profitable at all, whereas with the purely engineering part of the installation the costs of the plant and erection can be worked out to extremely fine points with a definite certainty of making a profit out of the job.

I have recommended for years that consulting engineers should issue their specifications as a whole, as by doing this I do not think they get any worse dealt with, and what is more to the point, they can fix the entire responsibility on to one firm. In fairness to some consulting engineers, I may say they have adopted this attitude for some time past, but there are others, particularly in London, who have not done so, and my proposal to induce them to do this is the wiring contractor shall decline to carry out the wiring part, or what might be called the work which entails all the worry and humbug, and no profit at the end of it, as I am quite certain that the manufacturers of engines, dynamos, and accumulators will not be in a hurry to take on the wiring work after the experience some of them have had who tried this years ago.

"Facts," in his letter, states that if I possess the qualifications necessary for the carrying-out of work throughout without outside help, I should address my qualifications to consultants, so that they might be able to avail themselves of my assistance; I should be interested to know why he makes this statement, and why he should want to make out that I should be so keen to work for consulting engineers when I can design power plants myself, and—as my record in this direction shows—successfully.

Why does he also jump to the conclusion that the wireman is a man trained by someone else? Even in this war time, with less than a quarter of the staff of normal times, the only men I have been absolutely trained by myself, and some of these have been with me up to 20 years.

I think I can assure "Facts" from what I have said that I was in a position to talk as I did. I can, further, assure him that I have carried out during the last few years at least a dozen water-power plants, without any assistance whatever from the manufacturers, neither did I want any except the drawing of the machinery; and I further add that I can find at least a dozen firms in London, at any rate, who would say the same, as there are certain large firms who make a speciality of country-house electric lighting, and who would never think of availing themselves of the services of the manufacturers in the fixing of the articles they use, and certainly the designs of the installations are their own. I need mention no names in regard to this, as anyone with a knowledge of the trade knows there are firms who stand out in this particular class of work.

I may also add to my letter that I distinctly disagree with the practice of supplying everything electrical to any Tom, Dick, or Harry who likes to apply for it, and am extremely glad to know that with the new arrangements that have been made in the Electrical Contractors' Association we shall, I hope, in a short time be such a fighting force as to be able to dictate, and will not, as at the present time, have to grovel; I sincerely trust that the new arrangements will result in the Association being made as strong as the Motor Manufacturers' Association, which, as I remarked, is such a close corporation that even an electrical engineer was not entitled to the trade discount off a dynamo to use on a motor-car.

I am quite sure that the decent manufacturers in the country do not disagree with the question of the middleman at all, as, from their point of view, they have a great many additional travellers which otherwise they would not have, and it cannot be denied by anyone in business that there are certain men who, whether they are middlemen or not, have so much weight with certain of the buying public that their opinions are valued before those of any manufacturer. This is how corporations should look on electrical wiring contractors in towns, as when they talk so much about wanting to do their own wiring they entirely forget the large number of unofficial travellers they have selling their goods, for, after all, the supply of electricity in bulk can only be considered a question of so much manufactured article; but they, like other people, think there is a certain section of the population getting well paid for doing nothing. Electrical contractors might just as well adopt the same attitude by arguing that tailors have no right to the profit on the cloth in the clothes they make; or, to carry it further still, why bother with grocers, as you might just as well buy the articles from the people who make them; and the same argument applies to every middleman in the country. The so-called huge profits made by middlemen have been the subject of discussion by wholesalers from times far back, and most trades have come to the conclusion that it is impossible to do without them, neither would they wish to do otherwise; but the electrical trade, through the curse of the so-called factor, has been placed in the position that everybody who likes to get trade discount has only to ask a factor for it and he gets it, whereas if he had to deal with the proper electrical trade he would not.

There have been various attempts at different times to define the position of a trade buyer, and one in particular has been that the firm should keep a man that does wiring work; an agreement like this would no doubt be kept by the electrical trade, but the factor calls upon everybody with works

and gives them trade discounts irrespective of whether they keep a man or not, and they also do the same regarding country houses where the installation is looked after by the gardener.

It has also been stated that it is difficult to define an electrical contractor; but my definition is that, irrespective of the number of men he keeps, he must have some form of shop, like any other tradesman, and is entitled to profits on the results of any goods in his particular trade. On this definition I would stop absolutely all trade discounts to everyone else.

As stated before, I am looking forward to the time when the new articles of the E.C.A. will have some driving force at the back of them, and will be able to remove some of the grossly unfair systems of trading that exist in the electrical business, as I am quite confident that if motor manufacturers and plumbers can do this there is no reason why electrical contractors should not be able to do it.

Contractor.

Cause of Flicker.

I think the cause cannot be what your correspondents suggest, saturation of interpoles, or earth leakage, because Mr. Balsara states that the flicker seems to correspond with the throw of the engine; this would also probably exclude faulty governors.

The hint of valve trouble, so lightly put aside as improbable because, showing on the three sets, is neither improbable in three similar engines (presumably adjusted by the same man) nor is it a record.

There is my experience in the first installation of electric light in Simla over 20 years ago, with three vertical compound engines, cranks at 180 deg., and belt-driven simple compound dynamos. By the time the full load was on there was a flicker worthy of an early gas engine, and belt tightening to danger point made no change. "The fault must be in the dynamo." All switches off but one lamp gave absolute steadiness. "Then what is the cause?" "If the fly-wheel during one revolution travels at a varying speed flicker is certain." "But how could that happen?" "Faulty admission of steam due to faulty valves." "Humph!"

The engine contractors had no representative there, and as there was no one within 1,000 miles who knew as much as myself (and that was very little), I was given tardy permission to investigate. Diagrams taken with an unsuitable indicator told me nothing, but measurement by wedges showed that the steam admission, instead of being nearly equal on the up and down strokes, was considerably different. I was forbidden to cut the ports, but readjustment as far as the nuts could go improved matters so that "only your professional eye could notice it." I was told, and there I had to leave it. All three engines were alike; the flicker corresponding with the beat of the engine, of course. Putting two fly-wheels on one engine made no improvement.

Mr. Balsara's letter seems to indicate that at times there is a variation of the amount of flicker besides that due to the variation of load. An earlier experience when I was in charge of the electric light on the Atlantic liner *City of Berlin*, in 1880, may be useful. On one occasion on starting up, the small horizontal engine (for 12 arcs) behaved very erratically, giving a mad dash for one or two revolutions, stopping dead, going slow, and then dashing again. The engineers' staff professed ignorance of the cause until I pointed out that an irregular supply of steam would have such a result, and that there must be something wrong inside (that was as near as I could go in those days). The slide-valve was so loose on its spindle that I suppose "while men slept an enemy had done this."

From these two experiences I suggest that not only is the valve-setting faulty, but also that there is a slight looseness of the valves, and that friction checks this in varying degrees on different occasions, and that all three engines have the same fault.

I would also suggest that Mr. Balsara should write to Messrs. Belliss for enlightenment and guidance.

John W. Long.

Stafford, March 20th, 1916.

The I.E.E. and Alien Enemy Members.

The two recent meetings at the Institution on the enemy alien question must have opened the eyes of those who attended to the wide gulf that exists between the Council as a whole and the members.

One can understand a Council with a record like that of the I.E.E. getting out of touch with the aims and wishes of mere engineers, but one cannot understand the Council pretending to get the opinion of the members and calling the meeting at an hour when nine-tenths of the members would find great difficulty in being present; the fact that about 150 turned up should have shown them that the members did not mean to be trifled with. That is the kind of thing one would naturally expect from a German, but not from the Council of a great British institution.

The President stated that the Council were an average lot, neither better nor worse than the average member, but, judging from the speeches made by some of them at the second meeting, one felt that several, at any rate, showed a

lack of ordinary judgment. Fancy suggesting at this stage of the world's history that a German should be taken at his own valuation and trusted till he proved to be false; was it any wonder that there was a disposition on the part of those present to leave the Council with no freedom of action on this matter?

If the Council desire to fulfil their duty to those who elected them, and win back some of the trust which they have rightly forfeited, they should without further delay ask the various local sections to test the feelings of the members on the same issues as the London members voted on, and then carry out the wishes of the majority in the manner that they desire.

At present they seem to represent nobody but themselves, to judge by the voting in London.

Another Station Engineer.

I think the members of the Institution of Electrical Engineers are, generally, greatly indebted to you for the assistance which they have received from your valuable paper in respect of the question of members of the Institution who are of alien enemy origin.

It is very evident, after hearing the members of the Council speak at the informal meeting held at the Institution Buildings, why the Council have done nothing, and have ignored all representations made to them in respect of this matter, and, moreover, difficult to reconcile the statement made by the President that the Council of the Institution was not pro-German. If it had not been for the assistance afforded by your paper, I am sure the correspondence alone would not have been able to raise the agitation which ultimately compelled the Council reluctantly to take some steps in the matter.

It remains to be seen whether the President of the Institution will allow (as we understand he pledged himself at the general meeting) the recommendations which have been passed by the Dublin Local Sections and the Manchester Engineers to be balloted for by the total membership, or whether he will direct the three resolutions which were passed by a meeting representing less than 2 per cent. of the total membership, to be the only ones to be decided upon by the members in general. If so, it will be very evident that it is with the sole intention that the exclusion of alien enemy members shall not be sweeping, whereas if the ballot on the total membership were taken, it is a well-known fact that the Dublin recommendation would be carried by an overwhelming majority.

The fact that a man signs a piece of paper does not justify the belief that he has changed his character or nature. I claim that it is not a case for making invidious exceptions, and I concur in every way with the statement made by Mr. Worthingham that all members who have the taint should be excluded for the benefit of the membership in general.

P. M. A.

[We regret that the demands on our space have compelled us to abbreviate "P.M.A.'s" long letter, omitting parts which were only remotely connected with the subject under discussion.

We fail to see why our correspondents so bitterly attack the Council, in view of the proceedings at the informal meeting, at which the resolution originally put forward by the Council, after consultation with the 17 petitioning members, was in effect endorsed by an overwhelming majority; the new resolutions retained the spirit of the first, but were couched in more precise phraseology in order to cope with the difficulty of dual nationality. One resolution was added, relating to the permanency of the ban. Lastly, the President promised that the views of every member on the several resolutions should be ascertained by post. Short of a postal ballot, what more do our correspondents want?—EDS. ELEC. REV.]

WAR ITEMS.

Exemption Applications.—The Bradford Military Service Tribunal has granted exemption to a local electrical furnace operator, whose employer stated that he was engaged in electrical smelting—a new business, and the first of its kind in England. The firm are holders of contracts with the Admiralty.

At the Newcastle-on-Tyne Tribunal, on Friday, an electrical engineer applied for exemption on conscientious grounds. He admitted being in the employ of a controlled firm, but said it was not his fault if the current he supplied was mis-applied. He was recommended for non-combatant service.

At the Whitstable Tribunal Court a man appealed on the ground that he was in a certified occupation and could not be replaced. He is a fitter-driver at the electricity works. The local military representative explained that the employer of the man failed to convince the Tribunal that he was indispensable, and the appeal was time barred. The Tribunal struck the case out.

At Haslingden Tribunal, on March 16th, an electrician to

a large cotton manufacturing company claimed exemption, stating that he was the only employé who could look after the motors. He had been engaged in munition making, obtaining a certificate from the Minister of Munitions. Application was refused.

At Barrow Appeals Tribunal, on Monday, Mr. Wm. Drysdale, electrical engineer, applied for exemption for the only electrician he had left. Seventeen of his men had left from time to time to join the Forces or go into munition works. He was working on requirements for munition establishments. Mr. Drysdale said he had chances of other contracts, but he could not undertake the work if this particular man was taken. He added that he had got two men from the Labour Exchange since the application was sent in, but he could not say whether they would meet his requirements yet or not. The Chairman: We recognise how hard it falls upon you. We will extend the exemption until July 1st, and I hope that will give you plenty of time to get your other men going.

The Tudor Accumulator Co., Ltd., appealed at Dukinfield for six months' exemption, or total exemption, for their deputy chief clerk, and three months' exemption for C. W. Baxter (30), departmental cost clerk. It was stated that the firm had released as many clerks with special technical knowledge as could be spared at present—four out of eight eligible men had gone. Conditional exemption was granted in the terms of a letter which had passed between the military representatives and the firm, and it was stated that if there was no change the firm could appeal again.

At Salford, temporary exemption until May 31st was granted for a man appealed for by the head of a department in an electrical works who desired an extension of time in order that some of the contracts which the firm have in hand could be got out of the way.—At the same Tribunal, a local firm appealed for a number of men engaged in the telephone business. The men were engaged on highly specialised work, 10 per cent. being for the Post Office and the remaining 90 per cent. for other Government departments. Of the firm's employes, 138 had enlisted voluntarily, and since the war started the firm had had 50 per cent. more work and 150 fewer men to do it. It was stated that the Advisory Committee thought that forty men ought to be obtained from these works for military service, and the applicant was advised to get into touch with the Ministry of Munitions on the matter.

Three months' exemption was granted to an electrician at the Cheadle Royal Asylum who was stated to have charge of 2,000 lights.

At the Halifax Military Service Tribunal last week an application was made by Mr. John Mollett, that an electrician in his employ should be exempted until May 1st, in order that he might complete contracts upon which he was engaged. Mr. Mollett said he only asked for exemption until May 1st. The application was granted.

Russia's Electrical Industries.—At the Technical Association, Petrograd, on December 24th, Mr. I. S. Osadchi made a report on the position of the electro-technical concerns of Russia, and the immediate duties of the Association. On the question of the electrical industries of Russia previous to the war, he said there was not much information on them. But when the war broke out, and when the question arose of the supply of electro-technical goods to the Army, the producers found themselves in a very difficult position. At present, when the industry, thanks to the war, had made great progress, the necessity arose of finding out what was to be done in connection therewith at the close of the war. For this purpose, in the first place, they must fill up the blanks in their knowledge respecting that branch of industry by means of lectures, readings, etc., and also make wider circles of the community acquainted with the existing state of the industry and such success as had already attended it. The industry, after the declaration of war, took quite a different development from that observed before the war. But exact and systematic information on this point was not to be had. With this in view, the Technical Association should immediately organise a series of conferences for clearing up the conditions of the electro-technical industry for post war operations. In the discussion, it was shown that the satisfactory development of the electrical industry in Russia depended on a combination of conditions, of which the principal was the constitution of the coming Customs tariff. Down to 1905, the Customs question constituted the chief hindrance to the development of the national electro-technical industry, and a more intensive growth had begun with the change in the Customs tariff of 1905. The conditions referred to would have to be changed. The critical point of the coming development of the industry in the country would be the financing of enterprises. It would be necessary to call together an All-Russian Congress of electro-technical concerns and companies for making clear the requirements of the said concerns, and further measures for encouraging them and securing them against an increase of German competition.

Siemens Men with the Forces.—We have received a booklet of some sixty pages giving the names of the employes of Messrs. Siemens Bros. & Co., Ltd., and Siemens Bros. Dynamo Works, Ltd., who, down to last month, had joined the Forces. Altogether they number over 1,500. A Roll of Honour which accompanies it gives the names of 43 men in various departments who have fallen in the war.

The Trade Conferences.—In view of our recent reference to the statement made by M. Gurevitch concerning German concentration on South American markets after the war, interest attaches to a question asked in the House of Commons last week by Mr. MacVaugh. He asked the Secretary of State for Foreign Affairs whether steps will be taken at the forthcoming economic congress of the Allies in Paris to preserve equally the interests of all the Allied countries in the great neutral trade markets of the world, especially in the Far East and in South America, and to make certain that no arrangements would be entered into likely to affect or weaken in any way the existing trade in these great markets. In his reply, Sir E. Grey presumes that this will be one of the aims of the proposed conference.

It is announced that Mr. Runciman will be the principal British representative at the Allied Economic Conference.

A Reuter dispatch from Paris states that, at the request of Senior Luzzatti and M. Timiriazoff, presidents of the Italian and Russian Parliamentary Trade Committees respectively, and with the approval of President Poincaré, the International Parliamentary Trade Conference has been postponed to April 24th, 25th, 26th and 27th. The conference will abstain from the discussion of Customs regulations, leaving this subject to the initiative of the various Governments.

Canadian Traders' Tour.—The Montreal correspondent of the "Daily Telegraph" states that it has been decided by the Dominion Government to take active steps during the progress of the war to win for Canada as much as possible of the trade formerly monopolised by Germans. The Department of Trade and Commerce has already selected a number of practical business men to visit France, Great Britain, and Russia. They will travel to Europe this summer, and carry on an active trade propaganda with the Allied nations along the lines recently laid down in the resolutions of numerous Canadian Boards of Trade, following suggestions from Great Britain and France. In addition to this, trade emissaries will be sent to Chile, the Argentine, and other South American Republics, where the Germans had a very large trade before the British Fleet drove them off the seas. These emissaries have been selected on account of special knowledge of the countries they will visit, and also for ability to speak their languages. It is expected in this way to attain the double object of improving Canada's trade and increasing trade amongst the Allies, at the expense of Germany and Austria.

Companies to be Wound Up.—The latest list of companies ordered to be wound up under the Trading with the Enemy Acts includes the following:—

Australian Metal Co., Ltd., 2, Metal Exchange Buildings, London, E.C. Purchasers of machinery; business practically directed by the Metallgesellschaft, Frankfurt. Controller: C. H. Weatherley, 14, George Street, Mansion House, London, E.C. 4, March 19th.

The Allott Co. and Otto Rosentel, 4, Charles Street, Hatton Garden, E.C. Agents for sale of aluminium foil. Controller: Harold Hartley, 9, Ironmonger Lane, E.C.

Esslerk, Ltd., 91-93, Bishopsgate, E.C., dealers in electrical carbons. Controller: W. C. Jackson, 58, Coleman Street, E.C.

Continental Tyre and Rubber Co. (Great Britain), Ltd., Thurlow Place, South Kensington. Controller: H. Bishop, 41, Coleman Street, E.C.

Electrolytic Copper in Germany.—Since the outbreak of the war German representatives of the copper producing and consuming industries have co-operated with the metal firms on the Berlin and Hamburg Exchanges in regard to the establishment of a German quotation for electrolytic copper. These negotiations have now led to the decision to fix a quotation in Berlin in future, which will first apply to Germany, and in a short time, the merchants hope, also to the world. Transactions on the Berlin Exchange are also to be extended to aluminium, antimony, lead and spelter.

Henley Men with the Forces.—The following figures give particulars of the staff and workmen of W. T. Henley's Telegraph Works Co., Ltd., who have joined H.M. Forces:—Officers, 16; non-commissioned officers, 56; privates, 479—total, 551. The casualties have numbered 49, thus:—Killed in action or died of wounds, 10; wounded, 30; missing, 2; prisoners of war, 7. Corporal W. Dagger (Duke of Cornwall's Light Infantry), since killed in action, was awarded the D.C.M. for bravery in the field (March, 1915). Driver J. Mason (R.F.A.) was awarded the D.C.M. for bravery in the field in July, 1915.

For Munition Workers.—On Thursday last week Princess Christian laid the foundation stone for a large recreation hall for munition workers at one of the Vickers works "somewhere near London." Sir Vincent Caillard, of the Vickers Co., said, in the course of his remarks, that to encourage musical activities amongst the employees a pipe organ would be installed in the hall, and Sir Frederic Bridge would open the instrument on the night when the hall was opened.

Prohibited Exports.—The exportation of the following goods to all destinations is prohibited:—Ferro-molybdenum, ferro-silicon, ferro-tungsten, radium, and tungsten. The exportation of X-ray apparatus is prohibited to all destinations abroad other than British possessions and Protectorates.

Controlled Works.—The number of controlled establishments is now 3,078.

Manufacturers and Statistics.—The feeling that has existed among many manufacturers for some time past at the extra demands that are being made upon them for statistical returns by Government departments found expression at a recent meeting of the Manufacturers' Section of the London Chamber of Commerce. It was stated, says the "Times," that these returns involve complicated calculations which apparently serve no useful purpose, when completed, commensurate with the work involved.

Trading with the Enemy.—The "London Gazette," for March 17th, contains amended and extended lists of persons and bodies of persons in Argentine Republic, Morocco, Netherlands, Persia, Portuguese East Africa, Sweden, with whom trading is prohibited.

Exporting to China.—The "London Gazette" of March 21st contains further lists of persons to whom articles exported to China and Siam may be consigned.

BUSINESS NOTES.

For Sale.—Particulars appear in our advertisement pages to-day of a sale of electrical apparatus to take place at Hamersmith on March 30th, by Messrs. P. Huddleston & Co.

Catalogues and Lists.—THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—Folder containing nearly 30 sheets of well executed three-colour reproductions of photographs showing alternating and continuous-current switchboards which have been supplied to customers. The pictures show views of work executed for a number of well-known public electricity supply stations, an electric railway power station, collieries, mills, &c., in this country, also power stations in Calcutta and the Argentine. Only a limited number of these folders have been issued, and it is not intended to distribute them generally.

THE EMPIRE TRADING CO. (Electrical Department), 69, Sisters Avenue, Clapham Junction, London, S.W.—Illustrated priced leaflet respecting "Rucella" electric radiators.

"Z" ELECTRIC LAMP MANUFACTURING CO., LTD., Southfields, S.W.—Pocket price list (No. E 500) of "Z" drawn-wire lamps. They are of a size suitable for enclosure with correspondence, and traders can have quantities overprinted with their own names, &c.

MESSRS. S. B. GOSLIN & SON, 13, Artillery Lane, London, E.—Leaflets respecting soft-iron castings for electrical and motor work, "Cyrol" alloy for aluminium soldering, &c.

Bankruptcy Proceedings.—J. W. & T. W. TATTERSALL, Willesden, London, electrical engineers.—April 1st is the last day for receipt of proofs for dividend. Trustee: E. S. Grey, Carey Street, W.C.

W. D. BIRETT, Arnside, Windsor Avenue, Whitley Bay, Northumberland, factor of electrical goods.—The following are creditors:—

British Electrical Manufacturing Co., Newcastle-on-Tyne	£260
British Westinghouse Electrical and Manufacturing Co., Ltd.	10
Palmer Electrical Co.	11

The first meeting of creditors was held on March 16th at Newcastle-upon-Tyne, when the deficiency was put at £173. The failure of the debtor was due to keen competition and inability to obtain goods owing to the war. He started trading as a factor of electrical goods under the style of the Northern Wholesale Electrical Supply Co. in June, 1915, with a capital of £6. In November, his largest creditors declined to supply any more goods on credit, and in January last issued a writ for £261 which he was unable to pay. The case was a summary one, and was left with the Official Receiver.

J. R. WHITEHOUSE, managing director of an electrical engineering company, Golder's Green.—First meeting, March 29th, at 14, Bedford Row, W.C.; public examination, April 13th, at the Town Hall, Barnet.

Book Notices.—Notes on Screw Gauges. From the National Physical Laboratory. Teddington: W. F. Parrott. Price 1s. 6d.—The difficulties in the way of producing screw-threads accurately to standard, and of testing their accuracy, are many and various, and have made themselves felt particularly at this time, when innumerable parts of munitions of war have to be interchangeable with other parts made in other works, and to other gauges. The staff of the N.P.L., therefore, have done a national service by compiling notes based upon their experience, with a view to facilitating the manufacture and testing of the gauges, and therefore the production of threads that will conform to the specified requirements. After emphasising the need for accuracy and the necessity of fully verifying gauges, the errors of screws and methods of measurement of the various characteristics of a screw-thread are dealt with fully. The pamphlet should prove invaluable to engineers concerned with the manufacture and use of screw gauges.

"Wireless Telegraphy and Telephony." By W. H. Eccles. London: Electrician Printing and Publishing Co. Price 12s. 6d. net.

Proceedings of the American Institute of Electrical Engineers, Vol. XXXV, No. 3, March, 1916. New York: The Institute.

Dissolutions and Liquidations.—BURDON OIL GAS FURNACES, LTD.—In voluntary liquidation, with Mr. S. C. Pratt as liquidator. Meeting of creditors at 23, King Street, E.C., on March 27th.

SOUTH AMERICAN CABLE CO., LTD.—A meeting is called for April 18th, at the offices, 25, Rue de Clichy, Paris, to hear an account of the winding up.

SPARKES MOTOR GARAGE, electrical and motor engineers, Dorset Mews North, St. Marylebone, London.—Messrs. G. H. Day, W. W. Symper, and W. A. Jones have dissolved partnership.

SPAGNOLETTI, LTD.—A meeting is called for April 27th, at 34-36, Gresham Street, E.C., to hear an account of the winding up from the liquidator, Mr. A. G. Morrish.

BRITISH ECONOMIC LAMP CO., LTD.—A meeting is called for April 27th, at Windsor House, Kingsway, W.C., to hear an account of the winding up from the liquidator, Mr. H. E. Leigh.

Private Arrangements.—ISRAEL ERNEST POYSER (trading as the Liverpool Electrical Co.), 55, Renshaw Street, Liverpool, (electrician).—The creditors interested in this matter were called together on March 16th, when the statement of affairs submitted showed liabilities amounting to £385, and net assets £117, the estate disclosing a deficiency of £268. It was reported that the debtor started trading from his home address in 1906, and in January, 1911, he opened premises at 78, Lark Lane, Liverpool, where he traded as J. E. Poyser & Co. He sold the business two months later for £160. On February 8th, 1913, he commenced at 55, Renshaw Street, Liverpool, in partnership with another and traded as the Liverpool Fittings Co., the debtor putting £200 into the business. The partner was unable, however, to find his share, and in July, 1913, the partnership was dissolved, debtor taking over the assets and liabilities, the latter being £460. Apparently the business was financially embarrassed at the time of the dissolution, but the debtor carried it on in the hope that he would be able to pull the business round. Owing to the war, labour troubles, and restricted lighting regulations, he had not been able to do this, and he attributed his present position to these causes. After fully discussing the position, it was decided that a deed of assignment should be executed to Mr. Parkin S. Booth as trustee, with a Committee of inspection, consisting of the General Electric Co., Ltd., Baxendale Bros., and Downes & Davies to supervise the realisation and distribution of the assets. The following are creditors:—

Baxendale Bros.	£21	Downes & Davies	£19
Barwell, Sons & Co., Lighting Ltd., J.	19	Falk, Stadelman & Co., Ltd. . .	67
Drake & Gorham	11	General Electric Co., Ltd. . .	52
		Jaeger Bros.	16

LIGHTING AND POWER NOTES.

Argentina.—A concession has been granted to Don Juan D. Evans for the utilisation of the waters of the Rio Porcoy for industrial purposes.—*Board of Trade Journal.*

A public electric lighting service has been inaugurated at Anafuya (Santiago del Estero).—*Review of the River Plate.*

Australia.—HIRE-PURCHASE SCHEME.—The Melbourne Council has adopted the "hire-purchase" proposal in connection with electrical installations within the area under its control, and has authorised the Committee to introduce a scheme for wiring premises in the city, also a scheme for the hiring-out electric motors, heating and other electrical devices to consumers, and to obtain the necessary statutory powers to enable the proposals to be carried out.—*Australian Mining Standard.*

The report of Mr. T. M. Carey, the Perth (W.A.) Corporation electrical engineer, for the past year, shows that 5,350,229 units were generated, being an increase of 4.59 per cent. over the figures for the previous year. The fuel consumed amounted to 16,395 tons, or 6.86 lb. per unit generated. The peak load reached 2,358 kw. on June 25th. The total number of consumers' connections was 7,199, an increase of 47.6 per cent. The large increase in the number of consumers is principally due to North Perth and Leederville consumers now being directly on the system, whereas previously these areas were supplied in bulk.—*Commonwealth Engineer.*

As the new Perth Government power station advances towards completion, preparations are in progress with a view to disposing of the energy which will be made available. The undertaking has powers to serve a very extended area, and the local authorities are readily arranging for supplies. The Town Council of Fremantle, the port of Perth, has signed an agreement for the supply of energy in bulk for a period of 50 years; the supply will be given over an overhead line operating at 20,000 volts, 40 cycles, three-phase, the distance to Fremantle being 12½ miles, and the Council will extend the extra-high-pressure transmission from its sub-station to the Henderson Naval Base, 7 miles from Fremantle, the total length of the 20,000-volt transmission being, therefore, over 19 miles. The maximum demand will be approximately 2,000 kw., and the energy supplied will amount to about 3½ million units per annum to commence with. The Government are also transmitting power over a distance of 10 miles to Midland Junction at 20,000 volts, to supply their railway workshops there, as well as the Midland Junction Council, the Guildford Council, and the West Guildford Road Board. At Guildford, Mr. Wm. Padbury is building a flour mill which will be

driven entirely by electric power on the most up-to-date lines, and will be the first in West Australia designed solely for electric driving. The work is being carried out by the staff with direct labour, under the direction of Mr. William H. Taylor, A.M.I.E.E.

Other important consumers are the Perth City Council and the Government's own tramway system, which is now being extended. Messrs. Merz and McLellan have acted as consulting engineers for the undertaking.

The Warwick (Queensland) Council has accepted the tender of the Electric Energy Supply Co., Ltd., at £4 4s. per 180 C.P. lamp per annum for street lighting.—*Tenders.*

Barnes.—The electrical engineer reports that it will shortly be necessary to extend the works, and that the present time appears to be appropriate for considering the advisability of adopting three-phase H.T. alternating current, the prime movers being high-pressure steam turbines.

Barnsley.—STREET LIGHTING CHARGES.—The Corporation has fixed the charge for public lighting for the half-year ending March 31st at £850, representing a decrease of, approximately, £400.

Bedford.—PRICE INCREASE.—The T.C. has increased the gross charges for current in all cases where the consumption is under 300,000 units per annum by 5 per cent., owing to the advances in the cost of coal and other supplies.

Bradford.—PLANT EXTENSIONS.—The Electricity Committee recommends acceptance of offers for new boilers and economisers at a cost of £23,500, owing to increasing demands for power. Last year the demand on the works reached 15,000 kw., and next winter it is expected to reach 20,000 to 24,000 kw. At present the modern plant at the Valley Road works includes three 3,000-kw. turbo-generators and one 5,000-kw. unit, also four slow-speed engine units, bringing the total to 18,000 kw. or with the old plant at No. 2 works, which is only used on special occasions to 21,000-kw. capacity. As regards boilers the department is not in the same position and additional boilers are necessary. The Committee considered the Treasury would raise no objection to the borrowing.

Birmingham.—COAL SUPPLY.—At a meeting of the City Council, Ald. Jephcott stated that at the principal station at Summer Lane coal could only be received by canal, but at the new station at Nechells arrangements had been made, which had now become operative, by which they could get both canal and rail-borne coal, which could be transferred to the canal and supplied to the stations at Summer Lane and Aston. The coal shortage was not due to the department not having ordered enough, and no difficulty was anticipated in the future.

Canada.—According to the *Canadian Electrical News*, the power question in Edmonton does not appear to be settled yet. In November last a contract with the Edmonton Power Co. was approved subject to ratification by the Provincial Legislature. Meanwhile, the Athabasca Power Co., of Winnipeg, and the Alliance Trust Co., of Calgary, are making offers of cheaper power to the city. The latter company offers to take over the present power house and sell power to the city at a rate approximately 20 per cent. lower than that called for under the present contract with the Edmonton Power Co. This offer is under consideration by the City Council at the present time.

Coniston.—E.L. SCHEME.—The Ulverston Rural Council has appointed a Committee to co-operate with the Coniston Council and meet the promoters of the electric lighting scheme to discuss the terms of the final settlement.

Continental.—ITALY.—La Società Adriatica di Elettricità has applied for a concession to put down a plant to utilise the water power of the river Brenta, near Campolongo (Province of Vicenza), for the generation of electrical energy for lighting and power purposes.

Darton.—The U.D.C. has granted permission to the Yorkshire Electric Power Co. to construct overhead lines between Darton Bridge and Darton Main Colliery.

Dublin.—COTTAGE LIGHTING.—The Corporation has adopted the reports recommending the New Spitalfields, North Lotts and Newfoundland Street housing schemes, which provide for the introduction of electric lighting in workmen's dwellings.

Dundalk.—Mr. Spalding, the electrical engineer, reported to the Urban Council that the final official tests of the new electrical plant at the power station had been completed, and that further tests under full load actual working conditions were proceeding.

Halifax.—The Halifax District Nursing Association has decided to have electric light installed in its institution.

Harrogate.—BULK SUPPLY PROPOSAL.—After consideration, the Corporation has decided that it cannot entertain the proposal to supply Ripon, having regard to the necessary capital expenditure and the limited electrical energy that would be required at the present time by Ripon.

Huddersfield.—POWER AGREEMENTS.—The Electricity Committee has resolved that the old agreements with power users be terminated as soon as the expiry.

India.—According to the *Madras Mail*, it has been decided to light the buildings of the Bangalore City Railway Station by electricity: negotiations have been proceeding with the Madras and Southern Mahratta Railway Co. for the extension of its supply from the Cauvery Falls plant, but these appear to have fallen through, and the railway is now arranging to put down its own plant in the Bangalore City Station grounds. It is expected that the installation will be extended to the Bangalore Cantonment Station.

Leigh.—SEWAGE PUMPING.—In connection with the pumping of Lower Green Sewerage, the R.D.C. has made arrangements with the Pilkington Colliery Co., Ltd., for the supply of electric power. The company is also to be asked to permit its electrical engineer to prepare a scheme for the carrying out of the work, and afterwards superintend the erection of any electric plant which may be installed at Lower Green Sewerage Works.

Ulanfairfechan.—E.L. SCHEME.—Mr. W. R. Walton has asked the Council for some payment on account of work carried out in connection with the electric lighting scheme, which is being postponed for a time.

London.—POPULAR.—The L.C.C. has sanctioned a loan of £2,000 to meet the Council's capital cost in linking-up its electricity undertaking with that of Hackney. The revenue accounts for the December quarter last show an increase of 1,321,755 units sold as compared with the corresponding period in 1914. The net income from the sale of current shows an increase of 1975 per cent., and the working expenses an increase of 505 per cent. The net surplus income shows a decrease of £928, which, in view of the high prices of coal and other conditions militating against profits, is considered by the Electricity Committee to be highly satisfactory.

ELECTRICITY CHARGES IN THE CITY.—The Court of Common Council last week considered the Streets Committee's recommendation that, subject to the Charing Cross Electricity Co. giving an undertaking that the proposed increase in the lighting rate of $\frac{1}{2}$ d. per unit would not be continued beyond 12 months after the war, no objection should be offered to the application to the B. of T. After some discussion, the Court declined to adopt the recommendation.

The City of London E.L. Co. has given notice of a probable increase in all charges for electricity, not exceeding 10 per cent., as from the 31st inst.

SHOREDITCH.—The L.C.C. has sanctioned the borrowing by the B.C. of £1,500 for house services, and £500 for meters.

LEWISHAM.—Having considered an additional charge of 10 per cent. made by the South Metropolitan E.L. and P. Co., for the supply of energy for lighting purposes, the Finance Committee recommends the B.C. to enter into a fresh agreement with the company, for a period of five years, for the supply for electric lighting purposes, at $\frac{3}{4}$ d. per unit, plus 10 per cent., and for power purposes at $\frac{2}{3}$ d. per unit, as hitherto.

WESTMINSTER.—The contracts between the City Council and the Charing Cross Electricity Supply Co., the Metropolitan Electric Supply Co., and the St. James's and Pall Mall Electric Light Co., for the supply of energy, have been under the consideration of the Contracts Committee. The Committee formally reports the continuance of the contracts with the two latter companies, while the Charing Cross Co. has given notice of termination, stating that it will let the Council know the rates to be charged after June 30th next.

Luton.—ASSESSMENT.—The electricity undertaking assessment has been increased from £5,000 to £6,200 gross and from £2,500 to £3,100 net, having regard to the recent extensions. The Corporation has been recommended to agree to the revised figures.

Middlesbrough.—At a recent meeting of the Electricity Committee it was reported that the generating costs had been reduced from '80d. to '55d. per unit during the month, the total cost having been 1,065, as against 1,244 in the corresponding period of last year, and the revenue 1,568, as against 1,290. It was stated that the reduced costs were largely due to the fact that they were purchasing energy instead of generating it by steam.

Newport (Mon.).—A summarised return of the receipts and working expenses of the electricity undertaking for the December quarter last, shows an increase in revenue from the sale of current of £2,895, as compared with the corresponding period of 1914, and for the three quarters of the present financial year, an increase of £4,519. The expenditure for the quarter was heavy, no less than £2,000 being attributable to increased coal costs, which, for the nine months, was upwards of £4,000. The number of units sold totalled 3,610,940, an increase of 210,934 over the nine months of 1914. As regards the ensuing year the general manager and electrical engineer estimate that generating expenses will show an increase of £1,523 over the current year and £7,366 over the preceding 12 months. On the other hand, however, they think there is every probability that the sale of energy for power purposes will result in a gratifying increase.

New Zealand.—The Ti Kuiti B.C. (having been unable to secure the machinery for the duplication of its plant) is endeavouring to obtain an additional supply of electricity from the Hora Hora Falls of the Waikato G.M. Co., which are nearly 50 miles distant.—*Times*.

Rawtenstall.—ASSESSMENT.—The assessment of the electricity extension has been reduced from £850 to £640.

Rochdale.—The Electricity Committee has, it is stated, decided to call in an expert from Manchester to advise upon certain matters connected with the electricity works—the question of charges and the maximum output possible.

Shrewsbury.—PRICE INCREASE.—By resolution of the City Council, the charges for electrical energy for all purposes are to be increased 20 per cent.

South Africa.—Recently the Victoria Falls and Transvaal Power Co. offered to supply the Johannesburg T.C. in bulk at 20,000 volts, with a minimum of 4,000,000 units per annum—on condition that the supply was taken between 4 p.m. and 8 a.m. each day, and did not exceed 6,000 units in any hour—at 75d. per unit delivered at one of the company's sub-stations. The Corporation to supply all necessary cables, transformers and switchgear. This offer was considered by Prof. Dobson, the manager of the Corporation electricity department, and, on his recommendation, was refused. The company's offer was made as an alternative to the Council's proposal to provide additional generating plant at a cost of £80,000, and it was pointed out that the load factor under the proposed presumably peak load conditions would only amount to 74 per cent.; that the cost of the purchased power would only amount to £12,500 a year, and that the saving in running costs due to better operating conditions should more than offset the capital charges on cables, transformers, &c. Mr. Dobson, on the other hand, considers that the T.C. would have to spend £35,000 to obtain the supply, and that if the five years' contract was continued after that period, the cost per unit would amount to 1d., while if terminated at the end of five years the cost would be 1'19d. per unit, and that, in both cases, substantial savings would result by the Corporation putting in its own plant.

Surbiton.—PRICE INCREASE.—The Finance Committee recommends that Messrs. Callender's Cable and Construction Co. be permitted to increase the maximum charge for electricity for lighting purposes from 6d. to 7d. per unit, the increase to remain in operation for a period of 12 months only and to expire March 13th, 1917. The Council approved the recommendation.

Swinton and Pendlebury.—The Clerk has been instructed to settle a compensation claim lodged in respect of a girl who was burnt through her clothes coming in contact with a "fire devil" used in connection with electricity extension work, and instructions are to be issued to Corporation watchmen cautioning them about allowing children to play near their fires.

Thirsk.—PRICE INCREASE.—On April 10th the charges for electricity are to be increased by 20 per cent.

Whitstable.—The U.D.C., which has been working the plant of the local Electricity Co. at the pumping station, has passed a resolution to the effect that no further wages be paid, nor coal or any other commodity be purchased, for the purpose of generating electricity on behalf of the company. The Council has also decided to pay £40 15s. 10d. to the Receiver acting for the company, as the amount due to the company on March 12th.

TRAMWAY and RAILWAY NOTES.

Ashton-under-Lyme.—The Trades Council has decided to protest against the proposed introduction by the Stalybridge Joint Tramways Board of women tramway drivers, contending that the routes include some dangerous roads.

Bradford.—Regulations have been submitted by the Corporation to the B. of T. regarding access to tramway cars at stopping places and controlling persons resorting thereto, which provide that when six or more persons are waiting at any terminus or stopping place, they shall form up in a "line or queue," and no person shall take any place other than in proper order—the latest person taking the last place at the end of the queue.

Canada.—HARBOUR TERMINAL ELECTRIFICATION.—For the past three years the Montreal Harbour Commissioners have had under consideration the electrification of the harbour railway terminals, and during the past year have visited and inspected the electric freight terminals of the New York Central, Pennsylvania, and New York, New Haven, and Hartford Railways where the application of electricity had proved successful in the movement of freight. As a result of this investigation an expert electrical engineer has been engaged to study the railway conditions of the port and to report on the advisability of the scheme. Should his report confirm the conclusions of the Commissioners, steps will at once be taken to proceed with the work of electrifying the Montreal Harbour terminals.—*Canadian Electrical News*.

Continental.—FRANCE.—On the electric trams in Bordeaux women are employed as drivers, and they have been found very satisfactory.

ITALY.—Application has been made for a concession for the construction and working of a narrow-gauge electric railway, about 10 miles in length, between Piacchia and S. Marcella Pistoiesi.

The Royal Commission dealing with the technical services of the State has nominated a sub-commission to study the whole problem of electrifying the State railways. This sub-commission has already begun its labours, by taking evidence from leading railway officials.

Darlington.—The General Purposes Committee has decided that for the purposes of wages computation all temporary motormen and handy men in the Light Railways department shall be classed as second-year men. This is equivalent to an increase in pay of 4½d. per day instead of 1d. per hour, as proposed.

Edinburgh.—The question of the appointment of a tramway engineer, in the interest of the Corporation, during the remainder of the Tramway Co.'s lease, the appointment of a tramway manager and the establishment of a tramway department has been remitted to a Sub-Committee of the Tramways Committee for consideration and report.

Huddersfield.—**RATE RELIEF.**—The Tramways Committee has decided to transfer £8,600 (equal to a 4d. rate) to the borough fund for the relief of rates.

Japan.—The Acting British Consul at Tamsui reports that, according to the local Press, a company has been formed at Tainan for the construction of an electric tramway from Tainan to the Port of Anping, a distance of about three miles. Negotiations have already been completed between the company and the military authorities for the purchase of the light railway belonging to the latter, which is the present means of communication by land between the two places. The capital of the company is said to be 400,000 yen (about £40,800).—*Board of Trade Journal*.

Leeds.—**RATE RELIEF.**—It is estimated there will be a net surplus of about £90,000 for the year on the Corporation's tramway undertaking (equal to a 10d. rate). The amount originally estimated was £55,000. Last year £81,000 was appropriated for the relief of the rates. At the close of the year about one million sterling in aid will have been contributed by the tramways to rate relief.

Newport (Mon).—A net profit of £1,187 is estimated on the tramways undertaking for the ensuing 12 months.

Rawtenstall.—The T.C. has just adopted a suggestion for the alteration of the stages and fares between Rawtenstall and Bacup, on and after July 24th. If the project is carried into effect the journey will be divided into eight stages instead of seven at present, and the fare will be 4d. instead of 3½d.

Southend-on-Sea.—The electrical engineer reports that it is necessary to renew the overhead trolley-wire on the whole length of the Leigh section, the cost of which is estimated at £1,206. The Corporation has been recommended to authorise the engineer to purchase the necessary materials. The Tramways Committee has adjourned for six months' consideration of the offer of Loughborough Road Car Co. to dispose of an Edison electric bus for £1,100. The L.G.B. has approved of the Council retaining and erecting for its own purpose two of the 200-kw. sets manufactured for the Leigh sub-station.

Swansea.—**TRAMWAY AGREEMENT.**—The Corporation has approved of the Tramways and Lighting Committees' recommendation as to the agreement with the Swansea Tramways Co., for the supply of the whole of the electricity for the running of the company's tramways and light railways at 1½d. per unit, with reductions to ¾d. per unit for all units in excess of 1,000,000 taken in one year, the price being subject to a coal clause. The company has agreed to hand over its power station to the Corporation free of ground rent, the Corporation to pay the company £400 per annum for 26 years. The cost of connecting up with the company's feeder cables is estimated at £2,000.

Swinton and Pendlebury.—At a meeting of the D.C. last week it was announced that the Salford tramways lease, which had been in hand for 10 years, had been completed. The lease runs for 21 years from 1905.

Wigan.—**FEMALE LABOUR.**—The Watch Committee has granted an application of the tramways manager for licences for three women car drivers and 17 women conductors.

MELBOURNE.—April 11th. City Council. 533,000 arc lamp carbons. See "Official Notices" to-day.

April 18th. P.M.G. 8,500 fuses.

April 26th. Victorian Government Railways. Car-lighting material—cables, switches, fuses, &c.

May 10th. Victorian Government Railways. Motor-generator set and accessories for battery-charging of baggage trucks.*

TAMWORTH (N.S.W.).—May 1st. Additional generating plant, switchboard, main &c., in connection with the municipal electricity undertaking. Specifications from Mr. V. G. Kable, Town Clerk, Council Chambers.

Dundee.—March 29th. Corporation. Electrical stores, meters, &c. Electricity Department, Dudhope Crescent Road.

Edinburgh.—April 3rd. Midlothian and Peebles District Asylum, Rossllyn. Stores, including electrical fittings. Forms from Clerk and Treasurer, 19, Heriot Row, Edinburgh.

April 1st. Corporation. Maintenance of telephone and electric bell installations; City Superintendent of Works. Engineers' stores, electrical material; Resident Electrical Engineer.

Leeds.—Electric light fittings for the Town Hall, Municipal Buildings, Judges' House and Offices in Great George Street. The City Engineer, Municipal Buildings, Leeds.

London.—March 24th. H.M. Commissioners of Works. Main switches, main fuses, switch fuses and fuseboards, for one year. See "Official Notices" March 17th.

Manchester.—March 30th. L. & Y. Railway. Twelve months' supply of stores (various). (30) Signal, telegraph and electric fittings; (31) signal, telegraph, and electric light wires. Mr. Waring, Stores Department, Osborne Street, Manchester.

March 29th. B. of G. Completion of the electric light installation at the Nurses' Home, Withington. Specifications (10s. 6d. returnable) from Mr. F. H. Overmann, 49, King Street, Manchester.

April 1st. Electricity Committee. (a) Low-pressure water and exhaust steam pipes, valves and supports; (b) valves for circulating water pipes. Specifications from Mr. F. E. Hughes, Secretary, Electricity Department.

Rathmines.—March 27th. U.D.C. Cable, house-service and fuse boxes, and meters, for 12 months. See "Official Notices" March 17th.

Redditch.—March 28th. U.D.C. Three and six months' supply of coal for the Electricity Department (125 tons of D.S. nuts per week). See "Official Notices" March 17th.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Barnes.—The Council is recommended to enter into a contract with the Tudor Accumulator Co. for the maintenance of the storage battery for a period of ten years at an annual payment of £135.

Barnsley.—The T.C. has considered the tenders of the Westinghouse Co., Messrs. Bruce Peebles, Messrs. Bertram Thomas, the British Thomson-Houston Co., Messrs. Dick, Kerr, Messrs. Crompton, and Messrs. Reynold & Co., for the installation of new plant at the electricity works, and has accepted that of the Westinghouse Co. for £5,146.

Bingley and Ilford.—Bingley U.D.C., house-service meters for one year, and Ilford U.D.C., electricity meters for another year: Electrical Apparatus Co. Ltd.

Colwyn Bay and Hornsey.—Messrs. Chamberlain and Hookham, Ltd., have received a contract from Colwyn Bay for meters for the coming year, and also a renewal contract for a further 12 months from Hornsey.

Government Contracts.—List of new contracts for February, 1916:—

WAR OFFICE.

Electric cable and wire.—S. S. Abelson & Co.; B.I. & Helsby Cables, Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Hooper's Telegraph and I.R. Works Co., Ltd.; I.R. G.P. & Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; St. Helens Cable & Rubber Co., Ltd.; Siemens Bros. & Co., Ltd.
Ebonite.—Peel-Conner Telephone Works Co., Ltd.; Siemens Bros. and Co., Ltd.
Generating sets.—Austin Motor Co. (1914), Ltd.
Lamps (electric).—Brinsdown Lamp Works, Ltd.; Brit. Thomson-Houston Co., Ltd.; Foster Engineering Co., Ltd.; Pope's Electric Lamp Co., Ltd.; "Z" Electric Lamp Mfg. Co., Ltd.
Switchboards.—Automatic Telephone Mfg. Co., Ltd.
Works services.—Electric lighting at Officers' Mess, Dover: V. G. Middleton. Electric lighting at Portland: G. E. Taylor & Co. Power house, Thetford: Mann, Egerton & Co.

POST OFFICE.

Telephone apparatus.—Siemens Bros. & Co., Ltd.; Western Electric Co., Ltd.
Testing apparatus.—W. G. Pye & Co.; I.R. G.P. & Telegraph Works Co., Ltd.; Park Royal Engineering Works Co., Ltd.
Telephone cable.—B.I. & Helsby Cables, Ltd.
Insulators.—Taylor, Tunnicliffe & Co., Ltd.
Galvanised wire.—Rylands Bros., Ltd.
Laying earthenware ducts and cast-iron pipes in Old Street, Great Eastern Street, E.C.—A. J. Ewart, Ltd.

CONTRACTS OPEN AND CLOSED.

OPEN.

Australia.—**SYDNEY.**—May 1st. Two 300-kw. turbo-alternators, condensers, switchboard, &c., for the pumping station at Ryde, for the Metropolitan Board of Water Supply and Sewerage at Sydney.*

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-kw. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney.*

Glasgow.—The T.C. Committee on Cleansing—a deputation of which has visited Dover, Sheffield, Nottingham, &c.—has agreed to recommend the purchase of two 2-ton Edison electric vehicles for the collection of refuse.

Johannesburg.—The Tramway and Lighting Committee recommends the acceptance of the following tenders:—

Two 3,000-kw. turbo-alternating sets, with Parsons condensing plant, switchgear, &c., £26,895; spare motor, £708—Sykes & Co.
Wet air filtration plant, £680.—Virtlin Engineering Co.

London.—**BERMONDSEY.**—The Electricity Committee has purchased out of contract eight wagons and 146 tons of coal, at prices varying from 21s. 8d. to 37s. a ton. For the annual tenders for coal no replies were received; the present contractors state that they are willing to quote from time to time for current supplies, and would endeavour to maintain deliveries at the rate of about 100 tons weekly. The price of Shipley peas now being supplied is 24s. 8d. per ton. The engineer has been instructed to purchase on this quotation as much as possible, and to supplement this by purchases at lower prices if possible. The Committee recommends the acceptance of the tender of Messrs. Chamberlain and Hookham for meters at an increase of about 7½ per cent. on the existing prices; also the offer of Venner Time Switches, Ltd., for Type B time switches. The Committee has accepted the tender of Messrs. Babcock & Wilcox, Ltd., for various fittings.

Southend-on-Sea.—The Tramways Committee has accepted the tender of Messrs. John Brown & Co. for 64 steel tires, at £37 10s. per ton, to be supplied as required.

Walthamstow.—The electrical engineer has arranged with Messrs. Myers, Rose & Co. to increase the amount of coal to be supplied during the ensuing 12 months to 60 tons of Warwickshire peas and 75 tons of Warwickshire double-screened nuts per week, and to supply as from November 1st next to April 1st, 1917, a further 50 tons per week of D.S. nuts and 50 tons per week of Derbyshire small nuts. The Council is recommended to accept the offers of the following firms to renew their contracts for annual supplies:—

Electricity Department.—Joint-box compound, Dussek Bitumen Co.; meters, Chamberlain & Hookham; carbon-filament lamps, General Electric Co., Cryselco, Ltd., and Electrical Mfg. & Supplies Co.; rubber insertion, G. Angus & Co.; cylinder oil, crank-chamber oil, and D.T.E. turbine oil, Vacuum Oil Co., Ltd. With regard to the remainder of the items, the electrical engineer has been directed to obtain quotations from time to time as required.

Tramways Department.—Lamps, General Electric Co.; rubber packing, G. Angus & Co.; trolley heads, W. Wood & Co.; trolley wheels, Anti-Attrition Metal Co.; paints and varnishes, Doekers Bros., R. Kearsley and Co., and L. Berger & Co. As regards controller fingers, punions, gear wheels, armature coils, oils and grease, castings, green paint, and car accessories, the tramways engineer is to obtain quotations for these as and when required.

OVERHEAD WIRES AND CABLES.

THE case of the Postmaster-General *v.* Hutchings, which was decided recently by the Railway and Canal Commissioners, serves to remind us that as regards the right to suspend telephone and telegraph wires over various kinds of property, the Postmaster-General is in a favoured position. If a private owner objects to wires being put over his park or garden, he may make a claim for compensation, which is settled, in the last resort, by the Railway and Canal Commissioners. In the case under notice, it was pointed out that where roads are public roads not taken over by the local authority, the person entitled to consent is the adjoining landowner; but he has no right to demand, as the price of his consent, that a certain annual sum shall be paid in the nature of rent. The Railway and Canal Commissioners said that a payment of the annual sum of £5 would have no relation to the actual damage done, but would be in the nature of a charge for use and occupation, which was not allowable. Wholly different considerations apply to the suspension of cables over private roads or places by persons who, unlike the Postmaster-General, exercise no statutory power or authority. That there is doubt prevailing on this matter appears from the letter of a correspondent in which he asks:—(1) In a scheme in which overhead cables are employed, where it is found necessary to take the cables over private property belonging to another party, provided the property is not entered during the process of erection, can the owner of the property legally object to such cables? If so, is it necessary to prove damage?

(2) What is the position in a similar case to the above, in which the property crossed is a road owned by the Council?

It is understood in both cases that no provisional order has been obtained by the company. With reference to these

questions, the mere fact that the person suspending the cables does not enter the land is immaterial. It is a trespass to suspend anything over a man's land even at a great height above it. No damage need be proved; and an injunction would be granted, in a proper case, to compel removal of the wires. With regard to roads owned by a local authority, the matter stands on a different footing. Attempts have been made from time to time on the part of local authorities to veto the right of putting up overhead wires, by resort to the various statutes by which the streets are vested in them. It is now well settled, however, that the vesting of the street or road vests in the highway authority such property, and such property only, as is necessary for the control, protection, and maintenance of the street as a highway for public use. And such property does not entitle the local authority to interfere with overhead wires which are put up in such a way as not to be dangerous to the public. By agreement, therefore, with adjoining owners, who may grant leave to put the necessary poles on their lands, it is possible to make arrangements for a non-statutory company to carry on its business. Note, however, that in this case the person suspending wires supplying electricity must comply with the regulations which have been made by the Board of Trade under Sec. 4 of the Electric Lighting Act, 1888.

THE SELLING SIDE OF ELECTRICITY.—V.

It may be opportune at the present time, when so many of the regular showroom representatives are called away on service in a greater field than electricity supply, to offer a few remarks to those who are "carrying on."

Perhaps the most trying moments in dealing with a captious public arise when a consumer calls to lodge a complaint. Even the best managed undertakings have complaints, and one of the most important functions of the sales department is to deal with them satisfactorily. It is obviously as valuable work to keep consumers as it is to get them. Indeed, more so, for a lost consumer means a dead service, and the capital spent thereon becoming unproductive.

American writers frequently take occasion to emphasise the necessity of courtesy, and remark that politeness costs nothing. This point is so self-evident that nothing more need be said upon that head. Tact is the next thing, and though it has been stated that this is a quality some people may never acquire, there is nothing to prevent anyone being sympathetic, and that is nearly the same thing. Bear in mind that many of your visitors who come to complain, are less keen in securing redress than in having their say. Listen with sympathetic interest, and don't short-circuit them before they have got it off their chests. They have probably thought out what they are going to tell you, and if they go off without having said it, the fact will rankle. Therefore, although the answer to their grievance may spring to your lips long before their tale is told, let them go through with it first.

There are usually a certain number of irreconcilables who turn up every quarter, their accounts, according to themselves, always being far in excess of what they could possibly have used, and so on. These constitute a problem in themselves, causing as they do an amount of work far in excess of what their business warrants. But it must be remembered that each of these has his circle of friends, and can do an incalculable amount of harm, so although he may be recognised as a chronic, he must receive his full share of attention.

Most stations find that some of their best friends have been discovered from complaints. Faulty wiring, un-economical lamps, over-shading, badly-placed lights, &c., are frequently at the bottom of heavy customer complaints. Nothing like full advantage is taken of two and three-point switching, and, one way or another, it is very rarely some remedy cannot be found. The ultimate result is increased business, for once the customer is satisfied that the supply authority is studying his interests as well as its own, he is ready to listen to other propositions which may be placed

The main schematic wiring diagram is shown in fig. 2, in which the double-break switches are indicated by three parallel lines across the circuit and the single-break switches by two lines. It will be seen that twelve of the former and ten of the latter are required for this equipment. Considering the fact that these switches control not only the main motor circuits for both 5,000-volt and 60,000-volt operation, but all of the auxiliaries as well, the equipment is very simple. Very satisfactory operation on 600 volts is secured by shunting the fields of the motors.

As before stated, power for operating this set is obtained from three mercury-arc rectifiers, which receive power from a 60-cycle, three-phase system and are operated in series. Connecting the three phases of the system in series not only gives a smooth current wave, but balances the load on the three phases of the transmission system. This is believed to be the first time mercury-arc rectifiers have been used in this way to furnish so much power for high-voltage work.

FORTHCOMING EVENTS.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, March 24th. At 7.30 p.m. At Bolter Hall, Newcastle-on-Tyne. General meeting.

Physical Society of London.—Friday, March 24th. At 5 p.m. At the Imperial College of Science, South Kensington, S.W. General meeting.

Manchester Association of Engineers.—Saturday, March 25th. At the Grand Hotel, Aytoun Street. Report of the Tool Steel Research Committee.

Electrical Trades Benevolent Institution.—Monday, March 27th. At 2.30 p.m. At the Institution of Electrical Engineers, Victoria Embankment, W.C. Annual general meeting.

Post Office Telephone and Telegraph Society of London.—Monday, March 27th. At 6.30 p.m. At the I.E.E., Victoria Embankment, W.C. Paper on "Telephone and Telephone Work in a Provincial Depot," by Mr. J. M. Rusk.

Institution of Electrical Engineers (Students' Section).—Wednesday, March 29th. At 7.15 p.m. At the I.E.E., Victoria Embankment, W.C. Annual general meeting.

Leeds Association of Engineers.—Thursday, March 30th. At 7.30 p.m. At 5, Park Lane. Paper on "Hardness and its Determination," by Prof. G. F. Charnock.

Royal Institution of Great Britain.—Saturdays, April 1st and 8th. At 8 p.m. At Albemarle Street, W. Lectures (IV and V) on "Radiations from Atoms and Electrons," by Prof. Sir J. J. Thomson.

NOTES.

The Water Power of the Main.—A Bill has been brought into the Prussian Diet to authorise the Government to expend £310,000 on the establishment of hydro-electric works at the weirs which are being constructed at Mainkur, Kesselstadt and Gross-Krotzenburg in connection with the general scheme for the canalisation of the Main from Offenbach to Aschaffenburg. The result of a technical examination shows that if four turbo-generators are provided at each place, it will be possible to obtain an average of 30,000,000 kw.-hours per annum, or 25,000,000 kw.-hours after deducting losses in lines and transformers. It is proposed to erect a transmission line between these works and the Government hydro-electric works on the upper part of the Weeser, so that an interchange of supply may be effected when necessary. It has been found that when the water power of the Main fails, or almost fails, that of the Weeser works is abundant, and *vice versa*. When the works have been completed, the supply from State generating stations will be in operation over an area extending from Bremen to the Main.

Italian Water Powers and Manufacturing.—The proceedings in connection with the eighth Congress of the Società Italiana per il Progresso delle Scienze, which was opened at Rome on the 1st inst., included the presentation by Prof. Ascoli of a paper on the electrotechnical industry in Italy. Dealing first with the production of electrical energy, the author stated that the situation of the country was very favourable for the purpose, in consequence of the utilisation of hydraulic power to a large extent. The Lombardy network comprised seven provinces, and afforded a very fine example of an initiative in the direction of national organisation of the water power of the kingdom. In 1913 the water power in principle exceeded 1,000,000 H.P., which was divided among the three principal groups represented by the Piedmont Alps, the Lombardy Alps, and the Central Apennines to the extent of nine-tenths, and in the proportion of about 300,000 H.P. in each case. It was also possible to reckon on the establishment of mountain reservoirs by the embankment of streams, particularly in the Southern Provinces, and a law already contemplated the formation of artificial lakes in connection with the Tirso, in Sardinia, and the Sila, in Calabria. With similar schemes there would be available several further hundreds of thousands of horse-power for industrial purposes, after having satisfied the requirements of agriculture. But the task of utilising the hydraulic energy would take a long time to carry out, and it would also be impossible to determine the total amount of power which could be derived therefrom. It was better for the present, the Professor continued, to examine another side of the problem which was very important, namely, the manner in which the energy

already rendered available could be fully utilised. It was found, for instance, that while the hydraulic power now at their disposal could yield 8,000,000,000 H.P.-hours, in reality the various industries only used 2,000,000,000 H.P.-hours per annum, the different works only being in operation for a certain number of hours daily. In other words, the energy at present used was equivalent to about 2,500,000 tons of coal, whilst if full advantage were taken of it, it would represent 10,000,000 tons of coal, or a saving of £12,000,000 in normal peace times, and of about £40,000,000 in the present exceptional times. It was, therefore, of special importance to co-ordinate the different industries, so that the consumption of electrical energy might be equally distributed throughout the day and the year, and every hydro-generating station should be provided with reservoirs, so as to yield extra power in the hours and months of greatest demand. According to the further report of the proceedings at the Congress, the Professor dealt at some length with the problems of manufacturing in Italy, but apparently no reference was made to foreign competition. Indeed, the author stated that for the greater part the alternators, switchboards, distributing conductors, &c., were produced in Italy, so that from this point of view "the national industry is in a satisfactory condition." This assertion scarcely coincides with the opinions expressed recently at meetings of the Italian Association of Electrical Engineers, as previously reported in this journal. Nevertheless, the Professor concluded by predicting the formation of a central organisation, which will be in permanent contact with makers, and which will cause all individual efforts to converge towards a single object.

Electrochemical Industries for South Africa.—In the *South African Mining Journal* of February 19th the publication of a report on the possibility of establishing on a commercial basis certain electrochemical industries was commenced. The report has been prepared by a Committee of the South African Institute of Electrical Engineers (known as the Development of Resources Committee), and has for its purpose to call the attention of the Government and others to the possibilities of manufacturing locally, by the aid of electric power, several articles of very great commercial importance which are now either being imported, or of which there is little or no importation owing to the cost of transport from overseas. It deals with materials produced by synthetic chemistry, and especially the manufacture of various valuable compounds which can only be formed at the high temperature available in electric furnaces; it is stated that there is produced in the world annually, by means of the electric furnace, about a million tons of manufactured product, of which the value is probably in excess of £20,000,000. The report is confined to the consideration of materials which are most necessary for agriculture and mining; these industries, taken together, require annually more than two million pounds' worth of chemicals, all of which are imported in the form of fertilisers, cyanide and nitrates. The essential elements for the successful manufacture of these compounds are cheap electricity, abundant coal, limestone, and the necessary labour, all of which exist in South Africa; and, furthermore, the local market is to a considerable extent protected from competition by the necessarily high costs of transport chargeable on imported articles, as well as by Customs duties. Imports of calcium carbide in 1913 amounted to about 2,600 tons, valued at £60,000; the estimated factory cost for local production is £35,850. The cost of cyanamide at South African Coast ports was, prior to the war, £13 per short ton (2,000 lb.); the estimated factory cost of local production is £9 per ton. The pre-war cost of sulphate of ammonia (an equivalent fertiliser) was £15 per ton. In addition to its utility as a fertiliser, cyanamide is valuable because of the readiness with which it can be induced to part with its nitrogen molecule to form many of the compounds used in the manufacture of modern explosives. South Africa, during the year 1914, consumed 10,518,000 lb. of sodium cyanide, having a total value of £454,713. In the opinion of the Committee, the various products dealt with can be profitably manufactured in South Africa, provided the necessary raw materials are obtainable at about the costs which have been assumed. An early investigation with regard to the location, quality and cost of production of these raw materials is a matter of the greatest possible importance, and it is hoped that the Government Munitions and Industries Committee, or some other suitably constituted body, will take the matter in hand forthwith.

Shortage of Electricians in Australia.—According to a Sydney newspaper a special general meeting of the Electrical Employers' Association of N.S.W. was held in February, to consider the situation which has arisen owing to the present shortage of labour in the industry, a considerable number of men having enlisted for active service, and a number also being employed by the Commonwealth authorities in connection with local defence. A resolution was carried "that the public be notified that owing to a large number of employes in the electrical industry having enlisted for active service, and a further number being employed by the Commonwealth Government for defence purposes, it is exceedingly difficult for employers in the electrical industry to carry out their contracts for electrical installations and to execute extensions and repairs within what would otherwise be reasonable time."

Orwell Electric Vehicles.—The Midland Railway Co. have lately acquired an "Orwell" 30-cwt. electric tilt van from Messrs. Mossay & Co., Ltd., for use in connection with their parcels delivery service. A 2-ton electric lorry has also been supplied by the same firm to the Ipswich Industrial Co-operative Society, Ltd. It may be remembered that the vehicles are built by Messrs. Ransomes, Sims, & Jefferies, Ltd., of Ipswich.

Fatalities.—**DEPTFORD.**—An engineer was killed at an electricity works at Deptford, last week, by a shock at 6,200 volts. He was found at the switchboard with his clothes in flames.

COVENTRY.—At an inquest held at Binley Colliery concerning the death of Thomas Pritchard, aged 48, who met his death while operating an electric coal-cutter in the mine on March 10th, Giuseppe Gogrene, an Italian by birth, said deceased was a stall man. About 3.50 a.m. on Friday deceased was cutting coal with a machine. Witness was there, and saw that the deceased had his left hand on the ratchet wheel and his right hand on the controller; he pulled the coal-cutter towards the face of the coal, with his stomach on the machine. He was not able to get off the machine, and shouted "Take me off." Witness touched his boot, and received a shock himself; he then ran to a switchbox 35 yards away and turned off the current. Deceased was thus released from the machine and fell to the ground. When witness touched him again the man was dead.

Ernest Runciman, the electrician of the colliery, was unable to state definitely how the deceased came to receive the shock which killed him. The Coroner questioned him as to the value of rubber gloves, boot soles, or mats as a protection against shock. Witness said that the sense of security afforded by these had often proved in itself a trap, by making men less careful than they otherwise would be. Such articles were liable to lose their efficacy, whilst leaving the user under the impression that he was safe.

Asked how he accounted for the accident, witness said it was very hard to account for. Subsequent tests had shown that it was an exceptionally safe machine. Investigation showed that an intermittent earth took place on the trailing cable, which was about 70 yards long, and was provided with a special earth wire; it appeared that this wire had broken, the effect of which would be that in the event of the machine becoming alive the provision made for earthing the current would be non-existent so far as this wire was concerned. There was, however, intermittent earthing through this wire due to the fact that when the cable was in some positions the two ends of the severed wire butted together, whereas at other times they parted. The machine itself was lying solidly on earth, and if it became alive there was every possibility that a large proportion of the current would be dissipated to earth directly from the machine. It was possible, however, that the man had been standing on earth which was a better conductor than the earth on which the machine rested, which was very dry clay. If he had had rubber gloves on he would not have been killed; but the Home Office did not call for—and he was sure they did not want—anything in the nature of rubber gloves. At the Binley Colliery everything possible had been done to reduce the danger from shock to the minimum.

The medical evidence showed that deceased died from paralysis of the nerve centres produced by shock. Proper attempts at artificial respiration were made, but were quite valueless, as the man must have died instantaneously. The jury returned a verdict of accidental death.

French Electrical Industry.—A survey of the condition of the French electrical industry is afforded by the recent report of the Société d'Applications Industrielles, a concern which embraces a number of important operative undertakings in the northern, middle and eastern portions of France. "Although," this report says, "the chief sources of income have been adversely affected by the war and the greater number of the undertakings have deemed it wise to withhold any dividend, results have nevertheless turned out more favourable than could have been expected. The undertakings are of two kinds—those producing current by means of coal and those utilising water power. The former have greatly suffered from the enhanced coal prices, leading to a rise in the cost of production, only partly compensated by the increased charge to the consumer allowed by the coal clause. On the other hand, the difficulties attending the purchase of fuel have thrown into relief the considerable value of France's water sources. All the undertakings producing energy by means of waterfalls have found themselves in a much more favourable situation. Numerous industries have been created to supply the growing requirements for national defence, and these have found in the power from the waterfalls a support such as, translated into figures, certainly stands for a very notable economy for the country. The available power in the hydro-electric networks has been rapidly utilised to its utmost capacity, and several waterfalls which were the objects of schemes before the war, are now about being harnessed to supply the energy which we are lacking. Everybody recognises it is to the general interest to aid the extension of the hydro-electric industry, and it is probable that, after the war, a rational and intensive utilisation of this source of wealth to the country will be witnessed, which will compensate in great part for the expenditure arising from the higher price of coal. All the producing and distributive undertakings have, moreover, found themselves in a very favourable situation from the point of view of the future, for they will be the first to benefit from the re-emption and growth of economic life in our country, of which they are one of the most indispensable factors."—*Revue Electrique.*

Water Power Legislation in Italy.—A Bill has been prepared by the Italian Government to deal with the use of water powers, and in substitution for the antiquated law of 1884. The Commission appointed by the Ministry to bring the matter to a speedy conclusion first decided to obtain the views of the Italian Electrotechnical Association, this being the only occasion when the wishes of the Association have been sought by the Government since its formation. A special meeting has been held to formulate opinions, upon which a report will be forwarded to the Commission.

Appointments Vacant.—Clerk for the Batley Corporation electricity works. See advertisement pages to-day.

Institution and Lecture Notes.—**Institution of Electrical Engineers (Western Local Section).**—The annual meeting of this Section will be held at Bristol, on April 3rd, at 5 p.m. A paper on "The Hire and Maintenance of Direct-Current Motors" will be read by Mr. H. Joseph. A morning dress dinner will follow, at 7 p.m., at the St. Stephen's Restaurant.

Mining Engineers.—At a joint meeting of the MINING INSTITUTE OF SCOTLAND, the NATIONAL ASSOCIATION OF COLLIERY MANAGERS, and the ASSOCIATION OF MINING ELECTRICAL ENGINEERS at Glasgow last Saturday, a paper on "Electric Winding" was read by Mr. F. Anslow.

Volunteer Notes.—**ENGINEERING INSTITUTIONS' V.E.C.**—Orders for week commencing March 27th, 1916.—By Lieut.-Col. Clay, V.D., Commanding.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Monday, March 27th.—Sections 1 and 2, Technical; Sections 3 and 4, Squad and Platoon, Signalling Class and Recruits.

Tuesday, March 28th.—School of Arms, 6 to 7 p.m.

Thursday, March 30th.—Shooting for Sections 3 and 4.

Friday, March 31st.—Sections 3 and 4, Technical; Sections 1 and 2, Squad and Platoon, Signalling Class and Recruits.

Saturday, April 1st.—Adjutant's Instruction Class at 2.30 p.m.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, March 23rd, 1916:—

Battalion Parades.—Sunday, 26th inst.—The Battalion will parade at Liverpool Street Station (low-level entrance, G.E.R.) at 9.30 a.m., and proceed by train for Entrenching duties.

Sergeant-Major's Class.—The Adjutant will hold an examination of members of the above Class, at Wembley Camp, on Sunday next, the 26th inst., commencing at 11 a.m. Members of the Class desirous of presenting themselves for this examination must send in their names to the Orderly Room before 12 noon on Saturday, the 25th inst.

Musketry.—The Acton Range will be open on Saturday next, the 25th inst. Members desirous of shooting must send in their names to the Musketry Staff.

The Miniature Range at Wembley Camp will be re-opened for shooting on Sunday next, the 26th inst.

A. G. JOINER, Major and Adjutant, O.B.C.

Argentine Naval Electrical Specifications.—The Ministry of Marine has recently approved some new regulations formulated by the Electrical Section of the Ministry's "Direccion General de Material" to unify types of electrical materials employed in the navy and to ensure a careful technical selection of same. The regulations referred to are subdivided into a number of sections relating respectively to: incandescent lamps, lamp fittings, conductors, fuses, interceptors and commutators, switches, cells and accumulators, ventilators and arc lamps.—*Review of the River Plate.*

Russian Mica.—The Central Military Industrial Committee through its electrical section has inquired into a number of questions affecting the immediate supply of the electrical requirements of the country, particularly for army use. In its report on raw material found in the country, it observes in respect to mica, that previously to the war all mica required in the Russian electrical factories was obtained from Canada and India. The best sort in sheets about 1 millimetre thick and 6 in. x 8 in. was valued at 90 roubles per pood. Last summer, however, in consequence of the disorganisation of the transport system in and out of the country, there were moments when the price of mica rose to fabulous heights, and it was bought by the factories at 25 roubles per funt (1 funt being a 40th part of a pood). Meanwhile, Russia controls immense reserves of the best quality of mica, and there was a time previously to the great development of the glass business, when Russia was the only furnisher of mica to the world's markets, in consequence of which this mica obtained the name by which it was scientifically known—Muscovite. Thus, in 1681, there was exported from Russia 2,580 poods of mica to Holland, 2,400 poods to England, and 500 poods to North America. Then there existed a special class of people called mica workers, who, by special Imperial Letters, were protected from the arrogance of the local authorities. With the development of the glass business, the mica industry gradually declined, and, finally, in Russia not only was the production of mica stopped, but all traces of those places were lost where, in the old days, the production was most actively carried on. They were only re-discovered in 1912 by the engineer Zilko. This occurred in the Mamsky virgin forest, but so far the exploitation of mica in Russia has not developed to more than 30 to 40 poods per month, whilst 5,000 poods are required in the course of the year by the electrical factories alone.

Besides the Mamsky virgin forest, there are deposits of mica in the Archangel Government, in the Urals, and in Eastern Siberia, in most cases consisting of mica of the best quality. It is remarkable at the same time, that Russian electrical factories, in consequence of the difficulties in the supply of foreign mica, paid at one time—true, not for long—25 roubles per funt, whilst the cost of production and delivery of one pood of the best mica from the Mamsky deposits amounted to only 30 roubles.

Engineering Trade after the War.—The Board of Trade has appointed a Committee to consider the position of the iron, steel and engineering industries after the war, especially in relation to international competition, and to report what measures, if any, are necessary or desirable, in order to safeguard that position. The following are members of the Committee:—Sir Clarendon Hyde (chairman), Mr. A. Balfour, Sir Hugh Bell, Bart., Mr. A. J. Hobson, Sir Halliwell Rogers, and Mr. Douglas Vickers.

At a meeting held at Manchester on Tuesday afternoon, the following resolution was passed:—"That in view of the greatly enhanced capacity of the British engineering industry, now engaged on munition work, and of the severe competition to be expected after the war, this meeting of Manchester engineers is of opinion that the organisation of the industry from within should immediately be undertaken." It was also resolved "that this meeting urges the Government to create a Ministry of Commerce, after consultation with representative commercial interests."

Inquiries.—Makers of an ampere gauge that can be attached to cables (without cutting them) are asked for. Also makers of "John Bull" dry cells and pocket flash-lamp cases, and of augers for making holes for setting telegraph poles.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—Mr. V. J. ALLAN, engineer-in-charge, electricity works, Southampton, has resigned, to take up the position of electrical station superintendent at Kilnarnock electricity works.

The Sydney (N.S.W.) Electric Light Committee recommends the appointment of Mr. F. T. DAVIES, manager of the power sales department of the Montreal Light, Heat, Power Co., as deputy general manager of the City Council's electricity supply department. Inquiries made by the Town Clerk by cable showed that Mr. Davies had had English technical training.

Stoke Newington B.C. is recommended to increase the salary of Mr. H. LARGE, chief assistant in the electric lighting department, by the addition of £20 per annum to his salary of £140, and to grant £25 as an honorarium for his services in acting as borough electrical engineer during Mr. Hann's absence. Several sub-station assistants also have received advances.

Tynemouth Electricity Committee has recommended that the salaries of Mr. DOWSON, shift engineer, Mr. J. WALLER, station superintendent, and Mr. H. T. WILKINS, chief clerk, be increased.

The Hackney B.C. is recommended to promote Mr. J. F. HATHMAN, chief clerk in the electricity department, to Class 2 (a), and increase his salary to £185.

Mr. D. MACFARLANE MACLEOD, who has for the past six years held the position of resident engineer to the Clyde Valley Electrical Power Co., has been appointed chief engineer.

General.—Mr. H. V. KILVERT, of the Lancashire Dynamo and Motor Co., Ltd., Trafford Park, was last week elected on the newly-constituted board of directors of the Manchester Chamber of Commerce.

The Highways Committee of the L.C.C. recommends that Mr. G. H. HUME be appointed chairman and Captain T. PRESTON vice-chairman.

From the *London Gazette*:—Territorial Force: Royal Engineers, London Electrical Engineers:—Chief Petty Officer H. J. WALLER, from the R.N.A.S., Anti-Aircraft Corps, to be Second-Lieutenant (on probation). Corporal A. J. ANIDO to be Second-Lieutenant (on probation). Sapper F. G. HORT to be Second-Lieutenant (on probation). Territorial Force: Royal Engineers. Tyne Electrical Engineers:—Second-Lieutenant T. T. TRICKER to be temporary lieutenant, October 18th, 1915.

Roll of Honour.—The D.S.O. has been awarded to Lieutenant-General E. L. COLLETT GRANT, R.N., who was in charge of wireless telegraphy at Cape Hatteras since May 1st. Admiral de Robeck reports that the work carried out by this officer has been of inestimable service; also to Commander J. F. SOMERVILLE, R.N., Fleet wireless officer, who performed duties of exceptional difficulty most efficiently.

The D.S. Cross has been given to Acting Warrant Telegraphist JOHN A. BRITTON, R.N., who displayed great ability and resource in erecting a wireless station at Cape Hatteras under fire.

The *Gazette* last week announced the award of the D.C.M. to Private F. MOTTERSEAD, of the 1/7th Lancashire Fusiliers (T.F.), for conspicuous gallantry in volunteering to destroy the entrance to one of the enemy's mine-shafts. Prior to the war he was employed by the British Westinghouse Electric and Manufacturing Co., Ltd., Trafford Park. He has been twice wounded, and is now in hospital at Alexandria.

Private THOMAS MORTON HEALEY, of the 9th Battalion West Essex Regiment, who was killed in France on March 1st, was prior to enlistment engaged as an electrical engineer.

The D.C.M. has been awarded to Corporal J. W. SMITH, late of the Nelson Corporation tramway staff, and of the East Yorkshire Regiment, for volunteering, at Ypres, to cut barbed wire entanglements under heavy fire, thus allowing his section to advance. Corporal Smith has also received the Russian Order of St. George for another courageous deed.

Sergeant JAS. HENRY, of the Northumberland Fusiliers, formerly at Berwick-upon-Tweed on the staff of the Urban Electric Supply Co., is reported killed in action in France. He had been posted as missing since April last.

Obituary.—LADY KELVIN.—We deeply regret to record the death of Lady Kelvin, which occurred on March 16th at Netherhall, Largs, Ayrshire. Lady Kelvin became the second wife of Lord Kelvin (then Sir William Thomson) in 1874, and the great scientist frequently referred to the splendid assistance that he received in many of his activities from his wife.

MR. IVAN LEVINSTEIN.—We regret to record the death, at the age of 70 years, of Mr. Ivan Levinstein, chemical manufacturer, one of the founders of the Manchester School of Technology, and an expert in regard to patent law matters. His patent principles requiring foreigners to work their patents in this country were adopted by Mr. Lloyd George in the Patents Act of 1907.

MR. J. GORDON and MR. GEO. CASTLES.—The deaths are announced of Mr. J. Gordon, manager of the electric station, Carrickson-Shannon, and Mr. Geo. Castles, director of the Dromore (Co. Down) Electric Lighting & Power Co., Ltd.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Baughan and Co., Ltd.—Particulars of £4,000 debentures, issued March 7th, 1916, filed pursuant to Section 35 of the Companies (Consolidation) Act, 1908, the whole amount being now issued. (Profits charged): The company's undertaking and property, present and future, including undivided capital. No trustees.

British Battery Co., Ltd. (137,905).—Capital, £1,000 in £1 shares (800 paid). Return dated December 14th, 1915: 800 paid and 199 and shares taken up; £399 paid. Mortgages and charges, £1,000.

Adelaide Electric Supply Co., Ltd.—Capital, £750,000 in £5 shares (550,000 paid, 50,000 ord., and 50,000 unissued). Return dated January 4th, 1916: 50,000 paid and 50,000 ord. shares taken up; £5 per share called up on 24,000 ord. and 50,000 paid; £4,470,000 paid; £130,000 considered as paid on 20,000 ord. shares. Mortgages and charges, £118,852 5 per cent. deb. stocks.

David Bridge and Co., Ltd.—Capital, £25,000 in £1 shares (16,000 paid). Return dated February 1st, 1916: 15,800 paid and 1,200 ord. shares taken up; £20,000 considered as paid. Mortgages and charges, £8,800.

CITY NOTES.

German Electrical Companies.

The A.G. Mir and Gustav, of Berlin-Schöneberg, after setting aside £40,000 for depreciation, as compared with £18,000 in 1914, reports net profits of £182,000 for 1915, as against £90,000 in the previous year. It is intended to place £50,000 to a reserve fund for the tax on war profits, £20,000 to the special reserve fund, and £15,000 to the dividend fund, and to pay a dividend of 18 per cent., as contrasted with 12 per cent. in 1914.

The Strassenbahn-Gesellschaft, of Hamburg, states in the annual report for 1915, that as the vital vein of the city lay in the overseas trade, which was completely at a standstill, the traffic suffered more from the effects of the war than was the case with many other towns. The net profits amounted to £26,000, as compared with £121,000 in 1914, and the directors recommend a dividend of 1 per cent., as against 8 per cent. in the preceding year.

The recent meeting of the *Elektronfabrikgesellschaften Werke, A.G., of Horrem*, which company was formed in 1913 with a share capital of £50,000, held entirely by the Metal Bank and Metallurgical Co., of Frankfurt-on-Main, and the Griesheim-Elektron Chemical Works Co., decided to increase the capital to £175,000 for the purpose of extending the plant and undertaking new branches of manufacture. The two companies in question have also taken over the new shares.

The *Fernmann Elektrizitäts-Unternehmungen, A.G., of Berlin* (the financial company of the Fernmann Electricity Works Co.), after having already disposed of the Nordharz, Wollenbuttel, and Bodenbach works, is now only interested in the Magdeburg Suburban tramways, the parent company having decided two or three years ago that the subsidiary should not embark upon any further business. The accounts for 1914-15 show net profits of £440, as compared with £29,500 in the previous year, and the debit balance remains at £26,000 on a paid-up share capital of £300,000.

The *Fabrik Isolierter Drähte* (late Vogel), of Berlin, reports that the decline in the turnover in the first quarter of 1914-15.

as compared with the corresponding period in the previous year, was fully equalised in the remainder of the year through working being adjusted to meet the Army requirements. After setting aside £7,800 for depreciation, as against £6,300 in 1913-14, the net profits are returned at £48,000, as contrasted with £32,000. The sum of £11,000 has been placed to reserve on account of the tax on war profits, and a dividend of 15 per cent. is proposed, as against 13 per cent. in 1913-14.

The *Elektrotechnische Fabrik Rheindt Marx Schorch & Co., of Rheindt*, reports for 1914-15 that all parts of the undertaking were fully employed, and night shifts had frequently to be worked. New plant was installed for the production of war materials, and the turnover was about five times greater than in the preceding year, the profits being correspondingly larger at £179,000, as compared with £19,000 in 1913-14. After making provision for depreciation, the tax on war profits, and the reserve funds, it is proposed to pay a dividend of 20 per cent., as against 12 per cent., on capital of £87,500, and to devote £43,750 to increasing the share capital by allocating the new shares in the proportion of one free share to two existing shares.

The directors of the *Grosse Berliner Strassenbahn* report that a gradual increase in the traffic occurred in 1915 with the further withdrawal of omnibus and motor-car services from the streets of Berlin, although great difficulty was experienced in coping with the augmentation owing to the calling up of 2,000 men, in addition to the 5,000 whom the Army authorities requisitioned in 1914. By the re-employment, however, of old drivers, the greater use of trailers, and the working of overtime and partial suspension of holidays, it was possible to maintain the mileage run at only 10 per cent. less than in the peace year of 1913, and 5 per cent. less than in 1914. As the number of conductors capable of being employed as drivers was now exhausted, and a further call of drivers for Army service was to be expected, women conductors had been trained as drivers, and 70 were placed on cars serving lines having light traffic conditions at the end of February, 1916. Women had also been increasingly employed in the offices and depots, the total now numbering 4,000. The company had applied for permission to increase the 10 pfennigs (14d.) fare, but the request had not been sanctioned, although it was intended to make fresh proposals at a convenient time. The accounts show the following figures:—

	1915.	1914.
Total receipts	£2,173,000	£2,118,000
Working expenses	1,310,000	1,300,000
Net profits and balance forward ...	327,000	328,000
Dividend percentage	6	6

The length of line in operation was 352 miles, and the number of car miles run was 56,878,800, as compared with 60,071,800 in 1914, the passengers carried having amounted to 437,000,000, as against 426,420,000 in the previous year. The number of employees declined from 11,407 in 1914 to 9,637 last year, despite the employment of the 4,000 women already mentioned, whilst the amount which had to be paid for electrical power increased owing to the uneconomical working of the new drivers.

British Electric Transformer Co., Ltd.

MR. A. F. BERRY presided at the annual meeting held on 17th inst. He said that their sundry creditors item showed an increase of about £13,000 as a result of the larger business done. In the circumstances, they were not excessive. It was not necessary to increase the amount put to depreciation reserve this year, but it might be necessary to place a larger sum to that reserve next year in view of the extensions to the works. The reserve fund would be increased by £7,500 to £31,823. That account had been built up entirely out of profits. Originally it had been created principally to meet losses which might arise on investments, but the ascertained losses in that direction had been met, and the whole figure could, if necessary, be set against patents and goodwill, which stood at £65,158. A conservative policy was being adopted in recommending the distribution by way of dividend of only about one-half of the profits. Their resources should be husbanded for the benefit of the business. They would not be justified in paying more than at the corresponding time last year, but he hoped that when the war was over, and business had settled down, they might be able to resume what they regarded as their regular 10 per cent. ordinary dividend. The past year had been the most extraordinary in the history of the company. Prices of all materials had risen to unprecedented figures, while they had been under contract to supply machines at prices fixed before the outbreak of war. All difficulties had, however, been satisfactorily overcome. Great difficulties had been experienced in getting deliveries of raw materials, and also in getting finished goods delivered, but those troubles had been considerably lessened. Practically the whole of the eligible members of their staff and workmen had enlisted or attested under Lord Derby's scheme. Much had been heard of late of the high prices at which war contracts had been taken. It was only fair to say that they had charged no more for transformers, used so largely for war purposes, than they had charged for their products in ordinary times. As to their prospects, they had commenced the year 1916 with a little less in orders than at the beginning of 1915, when a lot of work was held over at the end of 1914,

consequent on the war. Up to date this year their orders were about the same in extent as for the same period in 1915. At the moment "Tricity" cookers were looked upon by some as an economy, while others regarded them as luxuries. They were, however, improving designs and setting out fresh articles for which they believed there was a good demand. A great deal had lately been heard of the lack of interest taken by bankers in British industries, but they had always found their bankers willing to support them. On the outbreak of war, for instance, they had been assisted by their bankers of their willingness to advance such moneys as they might require, and, while they owed little or nothing to their bankers at the moment, he felt justified in saying that should they in the next two or three years again require assistance, all they needed would be afforded on the best possible terms. Bankers had scarcely been given credit for the very great assistance they had always given to industry. There was no doubt that when peace came they would find their great efforts in war work would be of considerable value to them. War experience had proved that the most convenient and economical way of driving machinery was by means of electrical power; war, by compelling the installation of electricity in so many factories, had put forward the clock of electrical development some five years, and they should reap the benefit from the fact that works, having had an opportunity of appreciating the value of electricity, would apply it still further.

British L. M. Ericsson Manufacturing Co., Ltd.

MR. W. M. CROWE presided at the annual meeting on March 15th. He said that the net profits had been increased by £2,000, and, in view of all the circumstances, that was a very good result. The year was not an easy one for manufacturers, and the difficulties of the previous year were increased four-fold with regard to the supply of raw materials and the shortness of labour. Their difficulties would have been greater but for the fact that they had a plentiful supply of female labour. The profit on trading increased by £4,775. The share capital remained unaltered. There was a loan from the bank of £24,000, secured by the deposit of £25,000 War Loan. The loan from the bank was necessary for the purchase of raw material for heavy orders received from the Government, and also for the purchase of additional machinery. Last year they showed in the accounts a large amount standing at interest at the bank, but that cash was now being used in the business and was earning better profits. The stocks on hand and work in progress at London and Beeston had increased enormously since last year, and the transfer of cash from the bank to the factory accounted for the difference in the cash balance. The amount of stocks, &c., at the end of 1914 was £113,904, and by the end of 1915 that item had increased to £180,849, or an increase of £66,945. Practically all these stocks and work in progress were put in hand against firm orders from Government departments. Therefore, they were as good as cash. The position of the company was improving each year. The percentage of profit on the whole capital of the company worked out at over 11 per cent., and deducting the preference shares, on which 6 per cent. was paid, the profit earned in respect of the ordinary shares was 16½ per cent. Of this profit they were paying to the ordinary shareholders less than one-half, namely, 8 per cent., which was good policy. The prospects of 1916 were very bright. The factory was full of work. The Post Office telephone department had practically shut down all installation work, and consequently manufacturers were suffering. They were, however, looking forward to the time when the accumulated work of years would have to be done by the Post Office, and then they hoped to benefit. He mentioned last year that they were going into the question of making magnetos for motor-cars and motor-cycles in order to meet the demand here, formerly supplied from Germany, but they were unable to carry out their good intentions in this direction owing to their having become a controlled establishment. They bought a quantity of machinery for the purpose of manufacturing these magnetos, and that machinery exactly suited the special work allotted to them. As soon as the war was over they intended going fully into this question again, and in the meantime they were acting as agents for Ericssons, of Buffalo, the original makers of the magneto they were taking up.

Newcastle-on-Tyne Electric Supply Co., Ltd.

Presiding at the annual meeting, on March 21st, Mr. J. H. ARMSTRONG, after summarising the financial results for several years, said that their profits had been adversely affected during the year by the reduction of lighting hours, and in the tramways supply, to the amount of 2,000,000 units. Other factors which had affected them were increased cost of labour, material, and coal, but, on the other hand, there had been compensating benefits from general consumers. They had spent £93,965 in maintaining the plant and system in an efficient state, as compared with £71,371 in the previous year. The cause for this increase was that they had taken out two motors and two old turbines of 3,000 H.P. and had replaced them by two modern ones of 6,000 H.P. each. The new plant was much more economical, and enabled them to gain 5,000 k.w. capacity. The dividend was half per cent. more than in the previous year, £38,299 had been received on consolidated first mortgage debenture stock. The expenditure on capital account had been £110,078 for the year, in accordance with the scheme of development laid down in 1914. On the laying of new mains £18,825 had

been extended, but only four new mains had been laid, as against 20 in the preceding year, but there were contracts which were running in 1914 which came in for payment in the succeeding year. The chairman referred to the scheme for fusion with the Durham Electric Supply Co., under which the Newcastle Co. took over the shares of the Durham Co., and he said that the trouble of the Durham Co. was want of capital, but now that the whole of the Durham area practically became their own (the Newcastle Co.'s) there was no necessity for money advanced for developments to go under the head of debts. Speaking of depreciation and reserves, the chairman pointed out that the Newcastle Co. had received in cash, representing profits and premiums, £502,568, and the whole of that sum had been spent on improvements and developments of the business. Speaking as to kindred companies with which they were associated, he said the Durham Co. had made £27,445 profit last year, as against £23,946 in the preceding year, when 1 per cent. was paid on the preference shares at their original value, while this year 3 per cent. was paid on the whole of the capital, and £6,000 was set aside for depreciation, as against nothing in the previous year. The Houghton Co., which was part of the interests they acquired in the Durham collieries, had a capital of £23,550, and had paid a dividend of 10 per cent. this year and had carried £1,000 to reserve, the total of the latter being now £5,000. The Hon. R. H. BRAND seconded, and after congratulating shareholders on the sound position of the company, he said that they had, as always, pursued a conservative policy as regarded the disposition of the extra profits made. That policy was especially necessary for two reasons; one was that they did not know what the general financial position was going to be during the war and after it. He would be a very wise man who could look forward and say what was going to happen. Capital would be much scarcer after the war, and that would mean that there would be an extra charge on industrial undertakings. These would have to pay more for their capital, and would find it very difficult to get. Thus, it was wise of the directors to pursue a conservative policy and strengthen the company's position. A company like that could get capital on terms if it was prosperous, but it all depended on what they were prepared to pay for their capital.

London and Suburban Traction Co., Ltd.

The Rt. Hon. C. R. STUART-WORTLEY presided at the annual meeting, held on March 15th. After going through the accounts, he referred to the effect of the war upon their fortunes. There was not an operating enterprise, but a holding company. Their fortunes and prosperity depended on those of the operating companies whose stocks they existed to hold. There had been a great all-round increase in prices of materials and cost of labour. Coal by rail had advanced by 13 per cent., and sea-borne by 34 per cent. Timber had gone up by 50 per cent., glass 90 per cent., copper 50 per cent., wood blocks 31 per cent., and steel tires by 20 per cent. All their subsidiary companies were interested in some of those commodities, and some were interested in all. In some cases prices were still rising. The chairman proceeded to refer to the increased cost of labour, to the enlistment of men for war service (1,466 from the different companies, or 35 per cent. of the whole). The number of women conductors employed by their three companies was 281, and it would undoubtedly be increased. There was an all-round improvement of the reserves of the various companies. In the second year of war their position was a good deal better than it might have been.

Llanelli and District Electric Lighting and Traction Co., Ltd.

Mr. A. R. HOLLAND, presiding at the annual meeting, held last week in London, said that the year had been an extremely difficult one. Cost of fuel and materials had greatly increased. The increase in turnover was more than offset by the increase in expenses. Labour had been difficult to obtain, and repair, maintenance, and installation work were difficult to carry out. Under all the circumstances they were to be congratulated on the result, although the net profit was reduced. In the ordinary course they would have been asked to approve of an increase in the capital to provide for past expenditure and future development, but that matter must be postponed. Lighting and power rates were increased in the latter part of 1915, and further increases might have to be made in the near future. A fair amount of new power business had been secured, and further additions were under consideration.

Madras Electric Tramways (1904), Ltd.

The gross profit for 1915 was £22,498. After debiting interest and London office expenses, providing for debenture sinking fund, putting £6,000 to depreciation and renewals, £11,031 remains, plus £3,258 brought forward. Dividends of 6 per cent. are paid on the preference and ordinary shares, £581 is written off the balance of the cost of issue of new preference shares, and £1,272 is carried forward subject to excess profits duty. Traffic receipts increased by 6.4 per cent., the whole of the increase occurring in the latter part of the year. The special renewals of the permanent way having been practically completed, the reduced sum of £6,000 has been credited to depreciation and renewal fund. The reserve arising from the debenture stock sinking fund is now £7,178. Mr. T. E. Irens, a director, has died, and Mr. J. G. B. Stone has been elected to the board.

Automatic Telephone Manufacturing Co., Ltd.

The profit for 1915 was £41,868, plus £5,256 brought forward. Directors' fees require £2,450, depreciation on patents, goodwill, buildings, plant and machinery, £6,000; there is written off underwriting commission on shares £3,500; written off preliminary expenses, £2,000; preference dividend, £12,000. A dividend of 1 per cent. (less income-tax) for the year on the ordinary shares requires £11,400, and £9,771 is to be carried forward. During 1915 several automatic exchanges have been completed, and are working satisfactorily; others are steadily approaching completion, but owing to the war no new exchanges have been ordered, and the company's normal business is suffering accordingly.

Launceston and District Electric Supply Co., Ltd.

The growth of business during 1915 was satisfactory. There are now 245 consumers with 5,654 lamps. The total revenue receipts were £1,232, and the working expenses £516, leaving a gross profit of £717. After deducting bank charges and preference dividend, the net profit is £589, which, plus £41 brought forward, after paying income-tax, makes a total of £630. A dividend of 3 per cent. is to be paid on the ordinary shares. On depreciation £250 is put, £30 is written off preliminary expenses, £50 to reserve, and £58 is carried forward. The units distributed were 31,253. The annual meeting was held on March 10th.

Northern General Transport Co., Ltd.

The directors state that the difficulties during 1915 were exceptional owing to the high cost of material and the scarcity of labour. The omnibus services had to be curtailed, and a number of vehicles were sold. The company holds shares in the Gateshead and District Tramways Co., the Tynemouth and District Electric Traction Co., Ltd., and the Jarrow and District Electric Traction Co., Ltd., which stand in the books at £332,134 cost, and the dividends for 1915 amounted to £24,215. For the year these three companies put to reserves and renewals £27,955. The result is a revenue for this company of £38,744, plus £4,230 brought forward. After deducting administration and general expenses, and interest, £4,808, and putting £6,536 to renewals, £1,372 is applied to sinking fund for redemption of debenture stock, 6 per cent. is paid on the preference and 6 per cent. on the ordinary shares, and £5,777 is to be carried forward. Meeting: Kingsway, March 27th.

Scarborough Electric Supply Co., Ltd.

During 1915 there were connected 871 new lamps, making the total 131,777. The units supplied were 637,219. The profit was £1,078. After paying bank interest and making various allowances, and putting £1,000 to depreciation, the credit balance of £1,716 is to be carried forward. Mr. G. ALDERSON-SMITH, presiding at the annual meeting on March 16th, said that they were in for hard times. Their receipts for current last year were £7,500, against £11,000 in the year before. There was a loss under this head of £4,000, and the rental of meters was down another £200. On the other hand, they had saved on coal. All their charges had been carefully looked into, and they were all down. The shareholders could not expect much more from the directors than that. Of course, they had had very bad times. The bombardment frightened away 200 of their customers, who shut up their houses, and their meters could not be read. After a great deal of trouble that, however, had been done, it had been a desperately hard time for them. They knew the state of Scarborough at present, and the trouble they had about the lights. Thirteen of their men had joined the Army, and three of them had been killed. Mr. CAMPBELL SWINSON, in seconding, remarked that the company was to be congratulated that it had not made a loss on the year's working, with £4,000 falling off in the revenue. It had only been by paying great attention to savings that they had done as well as they had.

British Aluminium Co., Ltd.—A financial contemporary states that the accounts for 1915 show a profit, including the sum brought in, after making provision for excess profit duty, &c., and after charging interest on prior lien and debenture stocks, of £204,808. £50,000 has been set aside for depreciation, and £70,000 added to reserve. After providing for preference dividend the directors recommend a dividend of 7 per cent. on the ordinary shares, carrying forward £24,791.

Compania de Electricidad de la Provincia de Buenos Aires, Ltd.—Mr. Justice Neville on Tuesday, in the Chancery Division, sanctioned a reduction of the capital of this company in accordance with special resolutions that had been duly passed. Counsel informed the Court that he believed the necessity for reduction was due to over-capitalisation, too many shares having been issued as fully-paid.

Bromton and Kensington Electricity Supply Co., Ltd.—After transferring £5,000 from the reserve fund to net revenue and putting £9,656 to depreciation and sundry reserve accounts, a final dividend of 11 per cent. is announced, making 10 per cent. for the year, and £6,011 is to be carried forward.

P. R. Jackson and Co., Ltd.—The gross profit for 1915 is £18,050. Of the available balance of £12,561, after paying 7½ per cent. on the ordinary shares, £3,000 is to be written off goodwill and £3,750 carried forward.

**Bournemouth
and Poole
Electricity
Supply
Co., Ltd.**

Mr. A. H. SANDERSON presided at the annual meeting on 16th inst. He said that the effects of the war were reduced receipts, reduced profits, and increased running costs. The gross revenue was down by £1,505. Cost of coal and oil increased by £1,912, but there were decreases under other heads. They carried to net revenue £38,681, as against £41,680 in 1914. £8,000 was placed to depreciation, against £7,000, and the dividend was 6 per cent., as against 7 per cent. for 1914. Having regard to the exceptional conditions, the results were satisfactory. They depended chiefly upon lighting revenue, so that the lighting restrictions had been responsible for the drop in receipts. They had increased the charges to consumers by 10 per cent. as from the commencement of this year. Of the company's staff, 75 had left for war service, and 35 attested ones were liable to be called within the next few months. The new second preference shares were offered to their share and debenture holders only, and the issue was considerably over-subscribed. From the new generating plant at the Bourne Valley lighting station they had derived considerable advantage, making a total saving of 25 per cent. on the capital cost of the plant. The lighting units showed a drop of 43 per cent., but the total output increased by 4 per cent.

**Windsor
Electrical
Installation
Co., Ltd.**

The capital expended during 1915 amounted to £1,927, and it was chiefly incurred for the installation of supplementary machinery for H.T. supply. The profit for the year, including £468 brought forward, was £6,515. Of this, £633 has been devoted to debenture and other interest, £1,020 to 5 per cent. preference dividend, £2,000 is put to depreciation, renewal and reserve fund, directors' fees account for £250, 4 per cent. is to be paid on the ordinary shares, and £779 carried forward. The directors consider the result satisfactory, in view of the lighting restrictions and the high cost of fuel and other materials. During the year 3,736 new lamps were connected, making the total 60,339.

**Slough
and Datchet
Electric Supply
Co., Ltd.**

During 1915, £925 new capital was expended, and 1,263 new lamps were connected, bringing up the total to 30,120. The units sold increased from 831,803 to 1,070,327, and the revenue from £8,956 to £9,625. The revenue increase of £669 is due to cheap power supply. Lighting receipts decreased considerably owing to the restrictions over the whole area. Fuel oil for the Diesel engines had increased from £8 to over £6 per ton, and the rise in coal, wages, &c., coupled with the drop in the more remunerative lighting revenue resulted in a serious reduction in net profit. £1,250 has been put to depreciation and reserve, 4 per cent. dividend is to be paid, less income-tax, and £219 is being carried forward.

**British
Insulated and
Helsby Cables,
Ltd.**

The profit for 1915 was £295,132, plus £119,380 brought forward. The total is dealt with as follows:—Directors' and debenture trustees' fees, and remuneration to works' committee, £5,915; interest on first debenture stock, £22,500; interest on second debenture stock, £10,000; depreciation on buildings, plant, machinery, &c., £25,000; special depreciation on plant and machinery, £10,000; transfer to reserve account, £50,000; transfer to special reserve account, £8,500; transfer to first mortgage debenture stock redemption account, £5,000; dividend on preference shares, £30,000; dividend for the year on the ordinary shares, 15 per cent., plus a bonus of 24 per cent., carrying forward to next account, subject to excess profits duties, £160,096. The company is a controlled establishment. The volume of trade during the year was well maintained, resulting in an increase of £17,703 in profit. Annual meeting: Liverpool, March 27th.

**W. T. Henley's
Telegraph
Works
Co., Ltd.**

The directors' report for 1915 shows the following results—we have indicated the figures for 1914 in parentheses:—Profit, £161,109 (£119,246); less directors' and auditors' fees, debenture interest, income-tax, and amount written off for depreciation on buildings and machinery, £56,585 (£21,121). Adding £69,420 (£59,065) brought forward, the total is £173,944 (£149,191). From this are deducted:—£4,680 transferred to reserve in respect of depreciation of war loan and other trustee securities; reserve account £25,000 (£10,000); preference dividend £9,000 (£9,000); interim dividend on ordinary shares £10,000 (£10,000). The available balance is £125,264 (£99,420). From this there is to be put to the establishment of a staff pension and benefit fund £30,000, after being voted by shareholders; the final dividend on the ordinary shares, making the total 15 per cent. for the year, plus a bonus of 10s. per share less income-tax, will require £40,000 (£30,000), leaving £55,264 (£69,420) to be carried forward. A reserve has been made in the accounts in respect of the liability of the company for the years 1914 and 1915 for special taxation. The sum written off for depreciation on machinery has had to be considerably increased, as much of the plant has been run night and day on special work, and new machinery for special work, some of which will be useless after the war, has been purchased at inflated prices. Particulars of the employees, &c., who have joined the Forces appear in our

"War Items." Allowances have been made to dependents where necessary. The company is a controlled establishment. Annual meeting: March 29th.

**Direct Spanish
Telegraph
Co., Ltd.**

For 1915 the directors report that after providing for the preference dividend £46,941 remains. A dividend of 5 per cent. on the ordinary shares amounts to £3,231; a bonus of 2 per cent. on the same shares requires £1,293; £5,231 is applied to depreciation of Stock Exchange securities; £5,000 is put to reserve, and £32,185 is to be carried forward. This sum is subject to a special taxation of profits for 1914 and 1915, the amount being at present unascertained. Both the dividend and bonus on the ordinary shares are free of income-tax. £10,000, balance of a loan of £30,000 from the Eastern Telegraph Co., has been paid off since the last report. The cables and land lines have continued in good working order throughout the year.

Dublin and Lucan Electric Railway Co., Ltd.—At the annual meeting Mr. J. W. HILL, who presided, said that to meet heavy charges due to the war they had had to increase passenger and goods rates, but these were still lower than they were legally entitled to charge. Though passenger traffic was down, goods carried brought £164 more than in the previous year, and the total receipts, £7,511, were higher by £144, and constituted a record. They had secured the services on the board of Mr. Gerald Murphy, son of Mr. Wm. M. Murphy, chairman of the Dublin United (Electric) Tramways Co., and he was sure his experience of tramway and electricity work would greatly assist them.

Metropolitan Electric Tramways, Ltd.—At the recent annual meeting, Mr. GARCKE explained that they had reduced their services of cars owing to shortage of men and the 13 days' strike in May. But for these two factors they would have shown a large increase in traffic receipts. They were now employing 150 women conductors. Notwithstanding a reduction of 15 per cent. in the car mileage, the receipts in the latter half of 1915 were very good. The total expenses were £14,500 less than in 1914, against a total fall of £18,000 in receipts.

North Metropolitan Electric Power Supply Co., Mr. GARCKE, at the annual meeting on March 13th, said that the nature of their output had changed owing to the war. More was used for power and less for tramways and lighting; the units sold increased by 2,500,000, or 7 per cent. New power business had been secured, and they hoped to be able to permanently retain much of it, as factory owners were appreciating the benefits of electric power more than ever. If the war continued and coal prices did not fall they might have to charge higher prices for electricity.

London United Tramways, Ltd.—Mr. W. M. ACKWORTH, at the annual meeting on 13th inst., said that owing to the increased labour employed in their districts the traffic receipts advanced by £1,503. Satisfactory results were attending the employment of the 120 women conductors. Their number would be considerably increased. The increase in passengers was 1,711,000, and the car mileage fell by 14 million miles. Owing to higher cost of materials and other causes, the expenses only fell by £7,800.

Minhead Electric Supply Co., Ltd.—At the annual meeting recently, Mr. H. D. LEATHER, who presided, said that all things considered the year had been satisfactory. The profit was £1,753, as against £1,967 in 1914. As compared with other electrical companies of similar size in the United Kingdom, none surpassed theirs in lowness of working costs and amount put to depreciation and reserve. £400 had been invested in War Loan.

Clyde Valley Electrical Power Co.—The report for the last half of 1915 shows as follows:—Profit £47,466, brought in £12,430, transfer £25,000 to contingency fund for depreciation, &c. (making £150,000). It is recommended to transfer to special reserve £5,259, writing off balance of costs of Acts, 1901, 1904, and 1912, £8,353, dividend on preference shares to April 30th, 1916, £9,000, and carry forward £12,613.—*Financial Times.*

Victoria Falls and Transvaal Power Co.—The net earnings of this company, including those of the Rand Mines Power Supply Co., for quarter ended December 31st amounted to £190,265.

Hastings and District Electric Tramways Co., Ltd.—After paying 6 per cent. on the preference shares, £1,000 is put to depreciation, £1,500 to suspense account, and £795 is to be carried forward.

British Westinghouse Electric & Manufacturing Co., Ltd.—A dividend on the preference shares for the year ending December 31st, 1915, at the rate of 7½ per cent. is announced.

International Light and Power Co.—According to the *Financial Times*, the directors have decided to defer payment of quarterly dividends at present.

Globe Telegraph and Trust Co., Ltd.—A quarterly interim dividend of 2s. per share is announced.

Ramsgate and District Electric Supply Co., Ltd.—The report for 1915 shows that the gross profit, including £1,524 brought forward, is £1,511, and after allowing for interest at the rate of 5 per cent. per annum on outstanding accounts due to the contractors, and writing off expenses of creating debenture stock, the balance is £3,346. A dividend of 5 per cent. is recommended, £1,200 is to be placed to reserve, and £1,146 is to be carried forward. The annual meeting was held on March 13th, at Westminster.

Metropolitan Electric Supply Co., Ltd.—The annual meeting was held on Wednesday, Mr. W. HARRISON CRISP, presiding. After the report was adopted, a resolution was passed appointing a committee to report upon the company's affairs. We shall give a report of the meeting next week.

Hadfields, Ltd.—In the report for 1915, the directors say that in view of adjustments which may be necessary to meet the provisions of the Munitions and Finance Acts, £90,000 is to be added to reserve and renewal account, and £152,173 carried forward. In addition to the interim dividend of 1s. per share already paid on the ordinary shares, a further dividend of 2s. per share and a bonus of 2s. per share, all free of income-tax, are to be paid. Mr. J. T. Middleham, for many years secretary and chief accountant, has been elected a director.

STOCKS AND SHARES.

TUESDAY EVENING.

Markets are firm, in the confidence that the events of the war are going steadily in favour of the Allies. Without indulging undue optimism, the Stock Exchange is of opinion that the enemy loses ground as daily the Allies secure it. It is not so much in the actual fighting itself that the expectations of victory are placed; it is more in the indirect influences which begin to assert themselves, particularly in the neutral countries. There is no talk of early peace; but of ultimate victory—perhaps before many expect—there is held to be hope as reasonable as it is logical.

Therefore prices are nearly all better in the investment markets. Strength has returned to the Home Railway stocks. Industrials are holding their ground with a tenacity that would be surprising were it not based upon the confidence alluded to above. There is business, too, and that not only in the rubber market, but amongst investment stocks and shares—business that the near approach of the Budget has not sufficed to quench, as was the case ten months ago, when the 4½ per cent. War Loan was on its way.

The electric lighting tale of results is now complete for the year 1915. With most of the reports we have dealt in detail as they have appeared. The Brompton dividend came last, and, being at 11 per cent., making 10 per cent. for the year, formed a satisfactory wind-up to the list, because it, too, was expected to be less than its predecessor, in the same way that lowered dividends were declared by the St. James', Westminster, London, Chelsea, City, and Metropolitan companies. There is not much stock on offer in the market. A little inquiry would lead to the prospective buyer finding how comparatively few shares there are of which he could buy several hundreds without materially affecting prices.

The preference list offers good returns and security. Seven per cent. is to be obtained from the preference shares of the London Electric Supply and 6 per cent. from those of the North Metropolitan Power companies. A line of South Metropolitan Electric second preference might be picked up at about 19s. 3d., the return thereon being 6½ per cent. Charing Cross preference returns 6½; Chelsea preference, over 6½; Kensington second preference, 5½ per cent. Counties are better on the meeting, the speech of Mr. H. B. Renwick, the managing director, affording considerable satisfaction in market circles. The preference, however, are ½ lower at 10½. Kensingtons have fallen 10s. to 5½. The remainder of the list is steady.

General Electric preference at 9½ are ½ up. British Aluminium ordinary shares are strong, the dividend hopes causing steady buying. British Insulated ordinary remain at 11. The report says that the trade showed an increase in the profits of £17,703. The carry-forward is £160,000, subject to excess profits tax.

The City of London Electric Lighting Co. has given notice that it reserves to itself the right to increase charges for electricity, in consequence of the increased cost of production; but this will not become operative until confirmed by a further notice, to be issued not later than April 30th.

Underground Electric incomes continue to droop. It seems as though there is some fairly large block of stock requiring to be realised, because the rest of the railway market is firm to good. Districts are better at 16½, and Metropolitan, after dipping to 22½, recovered to 23½. Our tables show comparatively little change in the electric section, though, of course, improvement in the steam stocks is bound to be reflected in those of the tube companies in due course.

Telegraphs and telephones are placid. Eastern ordinary gained a point, but Anglo-American preferred is easier to the same extent. The New York Stock Exchange has put down prices during the last day or two, and some of the shares in the Canadian munition companies declined, owing, it is said, to expectations on the other side of the water that the war

would not last much longer. Recovery in Canadian Marconis is something of a feature, the shares rising to 8s.; while American Marconis are a little better at 15s. 9d., though the parent shares have not moved.

What news there is respecting Mexico is not so bad; but while it has the effect of strengthening prices in Mexican Railway issues, so far as the utility concerns go the tendency is heavy and depressed. Mexican Light & Power first mortgage bonds at 3s are 2 lower. The feature in the foreign section is a recovery of 2 in Brazil Tractions, this taking the price to 52½. Anglo-Argentine Tramways first preference have again eased off; the yield on the money at the present price, it will be noticed, comes to £7 6s. 8d. per cent. Bombay Electric preference at 10½ are the fraction to the good, and other issues in this department keep steady.

Activity prevails in copper shares, by reason of the pump that took place early this week in the price of the metal, which crossed the £100 line on Monday. Copper is fluctuating widely on either side of what the Stock Exchange calls par; and those qualified to express an opinion seem to think that it will move for some time to come round about 100. The price of rubber keeps in the neighbourhood of 3s. 6d. per lb. to a little over. Most of the reports and dividends now appearing are in respect of a period during which the price of rubber averaged about half-a-crown per lb.; so that a further rise of 1s. per lb. will not be reflected in profits for another six months or so, save in exceptional cases. There is much business being done in rubber shares, and the market in them in the Stock Exchange is rapidly becoming the largest in the House.

EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING FEBRUARY, 1916.

It will be noted with interest that the February returns of electrical exports from this country show a continuation of the steady improvement which has been taking place since December last.

The total value of the exports recorded for the month was £396,483, as compared with £381,599 in January, and £349,409 in December.

The electrical imports have been moving in the opposite direction, and the February total of £182,222, as compared with £216,407 in January, represents a bigger falling-off in value than in the previous month.

The re-exports valued at £15,614, show a marked advance in value, as compared with the £10,612 recorded for January.

The increased value of the exports was due, almost entirely to

improved business in the machinery, cable and telegraphic sections; cable exports in particular rose to a high value. In other directions *i.e.*, telephonic material, batteries, lamps, instruments, &c., the totals show a reduction as compared with January.

The import sections show a general falling-off, cable imports, however, being an exception, while machinery imports remained almost stationary in value.

Australia continues to be probably the best all-round market for British electrical goods; Indian purchases fell off considerably as compared with January, but, nearer home France and North-Eastern Europe accounted for a respectable trade.

It will be noted that American import figures, though still large, show a tendency to fall off, otherwise the importers remain much as in *previ* u months.

Registered Exports of British and Irish Electrical Goods from the United Kingdom.

Destination of exports and country consigning imports	Electrical goods appliances.	Wires and cables rubber and other insulations.	Electric lighting accessories.	Electric glow lamps.	Electric arc lamps and lamp parts.	Electric meters and instruments.	Electric machinery.	Electrically-driven machinery.	Batteries and accumulators.	Carbons.	Telephonic cable and apparatus and electric bells.	Telegraphic cable and apparatus.	Total.

NOTE.—The amounts appearing under the several headings are classified according to the Customs returns. The first and third columns contain many amounts relating to "goods" otherwise unclassified, the latter, doubtless, consisting of similar materials to those appearing in adjacent columns. Imports are credited to the country where a consignment, which is not necessarily the country of origin.

NOTES ON THE MAINTENANCE OF ROLLING STOCK ON THE LONDON UNDERGROUND RAILWAYS.

WE recently enjoyed the privilege of a tour through some of the repair shops of the Metropolitan District Railway and the Golders Green depot of the London Electric Railway under the genial guidance of Mr. A. R. McCallum, the chief assistant mechanical engineer to the Underground group of electric railways. The extent of the shops and the variety of work carried on therein were somewhat surprising, and many of the processes employed were extremely interesting. One of the novel features resulting from the war conditions was, of course, the employment of women in the shops, on all kinds of work, due to the scarcity of male labour, which constantly tends to become more difficult to cope with, owing to the calling-up of "groups and classes," and to voluntary enlistment in the Army and Navy. Subject to their obvious limitations, the work of the women appears to be satisfactory on the whole. They were first employed on the cleaning of cars, with satisfactory results, although the output of cleaned cars with the female labour has been found to be considerably lower than was obtained from male labour. They are now, however, also employed in the workshops not only on light work, such as taping and remaking armature coils and the making up of contactor fingers, but also in the heavy machine shops on drilling machines, metal saws, etc., mainly on repetition work.

The repair shops of the District Railway are situated at Ealing Common; considerable additions to the equipment of the shops have been made since the electrification of the railway was accomplished, in order to deal with the increase of traffic, and this has necessitated the purchase of additional cars from time to time, in which improvements have been embodied suggested by the experience obtained on previous rolling stock. The car bodies of the original stock were built of wood which had been rendered fire-resisting. The trucks were of somewhat light construction, and of comparatively short wheel base. The latest cars are of an entire steel construction with floors of fire-proof composition laid on steel plates. The new trucks are of pressed steel with a longer wheel base and are of very strong construction.

An interesting example of development is presented by the motor-car wheels. Troubles were experienced with the earlier type of wheel which have led, through stages, to the adoption of the wheel shown in the drawing herewith. This new wheel has a very massive centre of cast-steel with heavy spokes. The usual method of fastening the tire to the wheel centre by means of shrinkage and the use of a tire-retaining ring has been modified. The tire, which is of the section shown, is shrunk on to the centre, and holes are drilled through both tire and centre in an axial direction, one hole being drilled at the end of each spoke. The countersunk bolts which pass through tire and centre are a driving fit in the holes, and after the nut has been tightened the end of the bolt is riveted over in a recess in the head of the nut, thus effectually securing it from slackening back. A considerable number of these wheels are now running with most satisfactory results.

The original trucks are gradually being replaced by pressed steel trucks similar to those employed on the newer stock. The work of making these trucks is proceeding in the Ealing shops, where some additional machines—notably a heavy pneumatic hammer for the big forging work—have been installed. The side frames and transoms are purchased, as no facilities exist in the shops for pressing these, but the work of assemblage and the making of the forgings for the brake rigging, etc., is carried out. Owing

to the fact that the new trucks are of a longer wheel base than the old, alterations are required to the foundation brake rigging on the car body and to the electrical equipment (contactors, circuit breaker, etc.) which is hung under the car body and has to be re-arranged. This entails a very considerable amount of work, but justifies itself in the increased comfort of the passenger and in savings on the cost of truck maintenance.

The large majority of the traction motors on the District and London Electric Railways are of the G.E. 69 type supplied by the British Thomson-Houston Co., Ltd. These are of a plain four-pole character. Recent additions, however, have been of the G.E. 212 type, which are provided with interpoles, and they are giving very satisfactory service. It has not been found possible on the District to adopt ventilated covers on these motors owing to the conditions of working, but on the London Electric, where the great proportion of the running is done in tunnel, the new G.E. 212 motors all have inspection covers made of a frame holding wide mesh expanded metal. The result of the ventilation so obtained has been very marked in the reduction

ELEVATIONS AND PART SECTION OF FORGED STEEL WHEELS.

of motor temperatures, and it is hoped that an appreciable increase in the life of the insulation will result.

Owing to the fact that the Underground group of railways is under one control, it has been found possible to concentrate work of various classes in one or the other of the workshops. This is specially so in the case of armature repairs and coil-winding work, which have been largely concentrated in the Golders Green shops of the London Electric Railway. Here provision has been made for the manufacture and repair of all armature coils for the District, London Electric, and Central London Railways. Since war broke out a special room has been built for women and girl labour, and it is intended that this class of labour shall continue to be used for this work.

At the moment there is a considerable amount of work in hand in the repair of traction armatures. After the number of years that the railways have been in electrical operation, some trouble is being experienced through loosening of the armature core disks on the shaft and on the back cone. All defective armatures, accordingly, go through a rigorous examination for loose cores, and in those cases where this is evident the armature is entirely stripped and rebuilt on a new forged steel shaft. All the core plates are tested on a mandrel for inside

diameter and fit on the key, and only those which pass this test are used in the rebuilding—those which fail to pass being scrapped. The plates at each end of the armature are being replaced by plates $\frac{1}{2}$ in. thick, and the corners of the teeth at the end of the slots are being very well rounded off. Every care is taken that a newly built-up core is a sound mechanical job, so that the armature winder has a solid foundation on which to build.

The armatures are bar wound, the end connections being riveted and soldered. The copper bars are bent to shape on formers, and the coil is completed by being jointed at the back end in position in the slots. The insulation consists entirely of pure mica and micanite, the only fabric employed being one layer of cotton tape round the outside of the coil to give mechanical strength to the bar. Each bare copper strip (there are five conductors per bar) is insulated with a peculiar kind of tape, uniformly coated with thin layers of sheet mica. After the bars are so insulated they are placed together in batches of five, heated in an electric heater, and pressed in a water-cooled press. The bars are then laid in a micanite trough, the lid of the trough is laid on, and the whole is mica taped, after which it is again heated and pressed up and finally bound with one

resisting enamel. This dries with a highly polished porcelain-like surface, to which carbon dust does not adhere. An improvement has been noticed as a result in the number of flash-overs occurring.

At present all armatures, after winding, are painted with insulating varnish and baked in an electrically heated oven, but a vacuum impregnating plant is in course of erection which should have good results. The mica of the commutators is under-cut to a depth of $1/32$ in. and Battersea electro-graphite brushes are used.

In addition to the traction armatures, a great deal of other work is done in the Golders Green armature room—the range of motors dealt with extending through various kinds of lift motors, fan motors for the tunnel ventilating plant, air compressor motors, and tunnel drainage motors, down to the tiny Gramme ring wound motors used in the control gear of the Sprague lifts on the Central London Railway.

Mention of the cars which have recently been put into service on the Bakerloo Railway in connection with the opening of the extension of this line to Queen's Park and Willesden must not be omitted from these references to improvements on the Underground. A special feature is the provision of

Switch A.—Normally closed on position 1.
Switch B.—Two-way switch operated by end gates. Middle door locked with switch in position 3, and unlocked with switch in position 4.
Switch C.—Switch operated by centre door. Closed when door is open. This switch is in parallel with Switch B in position 4.

Switch E.—Switch closed when bolt of electric lock is shot home. Coils R_1 , R_2 , R_3 , R_4 resistance; R_1 , resistance equivalent to that of coils of middle-door lock.
Switch A in position 2 unlocks middle door irrespective of position of two-way Switch B.

WIRING DIAGRAM FOR DOOR LOCKS AND LAMP SIGNALS.

layer of Egyptian superfine cotton tape. The bar is then painted with insulating paint. The bar so formed is a very sound job with very high insulating properties.

It is interesting to note that the soldering of the armature bars to the commutator is being done in one operation, the whole commutator being soldered up in twenty minutes. The armature, ready for soldering, is stood on end, commutator downwards, and a ring of gas jets play upon the commutator risers. Resin is used as a flux and solder (62 per cent. of tin) is run in, and it runs in very well. An arrangement of this sort is possible with the "all mica" insulation. The time taken to solder up a commutator bar by bar with a soldering iron and gas jet is about three hours, so that there is a very considerable saving in time in this process. The covers for the front connections are made from horsehair cloth, as it has been found that this material does not perish so quickly under high temperatures as the cotton duck which was formerly used. The commutator end rings and adjacent parts inside the motor are painted with Pinchin-Johnson's heat-

a middle door half-way along the car, which facilitates the loading and unloading to a marked degree. Unlike the sliding doors on the District Railway, these middle doors are hinged and swing inwards to open. The door is operated by the passenger, who, when the door is unlocked, pushes it open to enter or pulls it open to alight, the door closing automatically by means of a Bardsley door check placed under the car floor. Although the doors are operated by the passenger, it is only while the car is stationary at a platform that the doors are unlocked. Electric locks are provided, which are under the control of the gateman; when the gates are opened at the ends of the car, the electric locks of the middle doors are released, and passengers can then push the door open to enter. When the gateman shuts his gates, if the middle door is closed the electric lock shoots, and he receives an indication of the fact on his signal lamps; if the middle door is not locked, the "danger" signal lamp remains alight until the door is closed and the bolt shoots into place, when a green light appears, and the gateman then signals that the train may be started.

THE USE OF CONTINUOUS CURRENT FOR TERMINAL AND TRUNK-LINE ELECTRIFICATION.

By N. W. STORER.

(Abstract of paper read before THE INSTITUTION OF ELECTRICAL
ENGINEERS, March 16th, 1916.)

This paper deals chiefly with the characteristics and possibilities of the continuous-current motor for handling trains in the most economical and satisfactory manner, not only on one line, but for interchanging equipments on lines where different conditions prevail.

The Series Motor.—The series motor has been so successful and has shown itself to be so superior to all other types of railway motors, that it is now used almost universally for traction. In addition to giving the most efficient performance, the steep speed curve makes the series motor more reliable and cheaper to maintain than any other continuous-current type, enabling it to withstand the severe service of rapidly accelerating heavy trains and developing overload torques that would be impossible in any other type of motor. It also gives the best commutation, and is least subject to injury resulting from the fluctuating line voltages that are common to all electric railways. Voltages of more than three times the normal have been reached on heavy-capacity third-rail lines due to surges following the opening of heavy loads or short-circuits.

The series motor as generally used has not the most efficient characteristics. As a rule the field becomes saturated at a current corresponding to about the one-hour rating. After the series-parallel control was introduced, the control of the field was abandoned, partly because of the grave troubles from commutation and overload which were introduced by running on the weak field. Thanks to the great progress that has been made in motor design, notably in the development of the commutating pole, field control is once more being employed. While giving the greatest economy in accelerating, its introduction has again called attention to the advantages of the motor with the steep speed curve and the unsaturated field.

For frequent stopping service the unsaturated motor will operate more efficiently, since it accelerates with so much less current. The difference is still more pronounced on overloads. The root-mean-square current will be very materially decreased in the unsaturated motor for a given service and, consequently, an unsaturated motor of a given rating will have a greater service capacity. There will also be a saving in rheostatic losses.

Field Control.—The use of field control still further improves the efficiency of acceleration, and offers, where desirable, additional operating speeds. This was first applied in recent years to the A.C.-D.C. locomotives installed on the New

voltage which may be used if desired between the full field and the normal field position.

There have been criticisms of electric locomotives in comparison with steam in several papers, notably that by Mr. Roger T. Smith. The electric locomotive scarcely received justice in those comparisons, owing to insufficient information on the subject, and if a continuous-current locomotive with the range of speed at constant output which is given by the Pennsylvania locomotive were applied to a given load condition, it would prove to be better adapted to the service than any steam locomotive, notwithstanding the very great improvements that have been made in steam locomotives in recent years. The Pennsylvania locomotive curves, for instance, show that it will develop an output of 1,200 h.p. at any speed between 42 and 76 m.p.h. It will develop 1,600 h.p. over a range of speed from 35 to 60 m.p.h., or 2,000 h.p. between 32 and 52 m.p.h.; it will develop 3,000 h.p. over a range from 27 to 41 m.p.h., or 4,000 h.p. from 25 to 35 m.p.h.

In cases where a heavy tractive effort is required for short periods of time, the electric locomotive has the enormous superiority of being able to handle the load at a higher speed.

With a locomotive such as the Pennsylvania, the rheostatic losses will be so small as to be of very little importance, as combination of control giving series, series-parallel, and parallel control with variations in field strength is adopted.

Ordinarily it may be assumed as certain that when maximum use is made of a field-control equipment it will reduce the rheostatic losses to not more than one-half of what they would be with the usual series-parallel arrangement. The total saving per ton-mile will, of course, depend on the number of accelerations made.

In general, if it is desired to reduce the power consumption to a minimum, the unsaturated motor having a steep speed curve is to be recommended either with or without field control wherever the service requires frequent acceleration or very heavy grades are encountered. It is a mistake to think that the field-control motor is going to be materially heavier for a given service than the simpler form of series motor.

Regenerative Control.—A great deal has been written and spoken in regard to the possible savings that can be effected by regenerating the power that is stored in a moving train during the stopping period, and also by saving the energy developed by the train in descending grades; 50 per cent. of the total power taken from the line is expended in this way on a great many lines, so that it is a matter of great importance.

The scheme adopted long ago on the Central London Railway, of saving this energy by elevating the station tracks, is one that can be tried in special cases with excellent results. It adds nothing to the equipment and makes the work easier, so that smaller motors may be used. However, it has its limitations; a train operating at 30 m.p.h. would stop without brakes if allowed to climb to a height of 30 ft., and a 14-ft. elevation would be required to absorb all the energy in a train moving at 20 m.p.h. It would not be feasible to save all of the stored energy, nor, in fact, would it be feasible to save any large part of it on a line having long trains and a high schedule speed. Such a plan is not practicable for the large majority of railways, but any scheme of electrical regeneration may be supplemented by the elevated station tracks.

Such a scheme is already pretty well developed and will soon be in commercial operation; it involves the use of the standard series motor, with separate excitation during

FIG. 1.—COMPARISON OF CHARACTERISTIC CURVES OF SATURATED AND UNSATURATED FIELD MOTORS, 200 H.P., 600 VOLTS.

York, New Haven, and Hartford Railroad to provide some speed control on the continuous-current zone of operation. The first large installation with purely continuous-current locomotives was on the New York terminal of the Pennsylvania Railroad.

Fig. 1 shows the curve of the motor for this locomotive, which has only two motors. The usual series-parallel connections combined with field control give four speed curves. These curves simply show the maximum range of speed at which the motor is designed to operate at normal and half voltages, but there are two intermediate speed curves on each

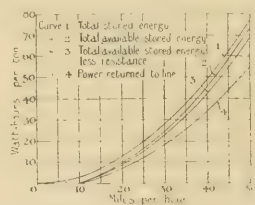

FIG. 2.—ANALYSIS OF POWER REGENERATION, REGENERATING TO 10 MILES PER HOUR.

regenerative periods. The control may be entirely automatic from the time it is applied until the lowest speed is reached at which the motors when connected in series can develop the line voltage. At the same time it can be stopped at any desired speed. The regeneration at high speed is with the motors connected in parallel, and the change from parallel to series is effected by a bridging method especially adapted to this purpose. There is no break in the retardation of the train from the maximum speed until it comes to a standstill; for the control is so arranged that the air brakes may be applied as soon as the minimum regenerating speed is reached. The use of the standard series motor in this connection is of the greatest importance, and the motor designed for field control assists in securing the maximum saving of energy owing to the fact that the regeneration can be carried to a lower speed.

It is usual practice in equipments for heavy multiple-unit service for city and suburban traffic to have the motors geared

for a speed of about 15 to 18 m.p.h. at the one-hour rating of the motors. Such an equipment will retard the train by regeneration down to a speed of 8 to 10 m.p.h. Fig. 2 is plotted so as to show the possible saving that can be effected by regenerating down to a speed of 10 m.p.h. The top curve shows the amount of energy that is stored in the car. From that is deducted the amount left in the car at a speed of 10 m.p.h. The next curve deducts the amount that is required to overcome train resistance at a specified rate of braking down to 10 m.p.h. From this curve is deducted the amount of power that is lost in the equipment during regeneration. In this case the efficiency of regeneration is assumed to be 80 per cent., which allows for a considerable loss in the auxiliaries. The lowest curve shows the energy in watt-hours per ton that should be restored to the line under the specified conditions from any speed under 50 m.p.h. down to 10. It is probable that in any case at least 45 per cent. of the stored energy can be returned to the line. If this stored energy amounts to 50 per cent. of the power taken from the line, the net reduction in power consumption should be more than 30 per cent.

Line Voltage.—By successive steps the line voltage has been raised until the standard for most tramways and suburban lines is now 600 volts. This seems to be the economical limit for small equipments such as tramway motors, and to have many advantages for heavy suburban work. In the United States a voltage of 1,200 to 1,500 has become the standard for interurban railways, whilst pressures of 2,400 and 3,000 volts are being used in one or two instances. A continuous-current voltage of 5,000 has also been used in use on an experimental equipment of the Michigan United Traction Co. for the past seven or eight months. In England 1,200 and 1,500-volt lines are now in operation, and a 3,500-volt experimental equipment has been in use for several years on the Lancashire and Yorkshire Railway. The tendency among the railways centring in London seems to be to adopt the 600-volt third-rail system. The 1,500-volt line is on the North-Eastern Railway, where it is used for the haulage of mineral trains, the locomotives taking current from two overhead wires in parallel. The 1,200-volt line on the Manchester end of the Lancashire and Yorkshire Railway is used in connection with a new type of third rail, the contact surface of which is located on the side of the rail farthest from the running rail.

In view of the possibility of still higher voltages and other contact systems being introduced in Great Britain, the question of interchangeability of equipments has become very prominent, especially under war conditions.

Two conditions of prime importance are necessary, namely:

1. The contact conductors must be so arranged that any equipment can take power from any line without change.
2. Every equipment must be so designed as to operate at required speeds over the various voltages of the different lines.

It is possible where the contact surfaces are properly located to have a single contact-shoe satisfactory for collecting current from either the under-running or the over-running type of rail. There is no reason to suppose that it would be impossible to shift the shoes in order to make contact with rails located at different places, provided that the distance were not too great to be covered. However, such things should be avoided if possible. The author can see no possibility for interchanging equipments between the top and bottom contact rails and the side contact such as is used on the Lancashire and Yorkshire Railway. With regard to overhead conductors, the problem is much simpler, and it should be possible to adopt a collector which will operate satisfactorily on any overhead line.

It may be assumed as correct within a very few per cent. that the horse-power or kilowatt rating of a motor is proportional to the voltage applied to its armature terminals. To obtain the rated output from an equipment of motors operating on multiple voltages, it is necessary to manipulate the control circuits so that each armature will always receive the same running voltage regardless of the line voltage.

As 600 volts is recognised as the standard voltage for most city and suburban railways, the higher voltages adopted or proposed are usually 1,200, 2,400, 3,600, and 4,800. A voltage of 1,500 has been adopted in several notable instances and is a very desirable voltage, as it is about the maximum on which the motors and control equipment of the form usually used on the 600-volt line can be used without considerable increase in the cost. It is not, however, usually considered to be high enough for trunk-line service.

Fig. 3 shows the speed curves that will be secured on a motor designed for a normal voltage of 1,500 when operated at lower voltages. With a current of 150 amperes, giving a tractive effort of 4,500 lb., the speeds are 22½, 17.6, 10.7, and 8.4 m.p.h. respectively at 1,500, 1,200, 750, and 600 volts.

The 5,000-volt car equipment which is in operation on the Grass Lake Line of the Michigan United Traction Co. is required to operate over about 10 miles of suburban line with 5,000 volts on the trolley and also over two miles of 600-volt line in the City of Jackson. Series-parallel control is used on the 5,000-volt line, and a balancing speed of 50 m.p.h. is normally reached. On 600 volts the four sets of armatures are connected in parallel and a speed of 18 to 20 m.p.h. is reached by shunting the fields of the motors. This method of operation can be followed successfully in a great many instances where equipments designed for high-voltage service are required to operate for short distances over low-voltage lines. It is quite practicable to shunt the motor fields down

to a very low value in such cases, as there will be no danger of flashing at the low voltages.

It is undesirable to equip cars with more than four motors each, as the complication and cost would become too great. With the locomotive, however, it is quite practicable to operate with eight motors.

As far as the motors themselves are concerned, there is very little additional complication from the necessity of interchangeability on different voltages. It simply requires the use of more armatures and at a greater cost than would otherwise be necessary. The motors, of course, would have to be insulated for the highest voltage on which they would be used. The complications introduced would be mainly in the control system.

A scheme by which eight armatures may be operated, four in series and two series in parallel, two in series and four series in parallel, or all in parallel, corresponding to full speed on 2,400, 1,200, and 600 volts, or full speed on 4,800, 2,400, and 1,200 volts and half speed on 600 volts, requires a total of 56 switches, most of which would have to be designed and insulated to handle the maximum voltage. The same number of motors arranged for operation on two voltages, when connected permanently two in series requires 36 switches.

The combinations may, to a certain extent, be made by means of drum-type change-over switches; such a scheme is usually used for car equipments operating interchangeably on 600 and 1,200 volts. This is shown on fig. 4, which is a standard arrangement for such an equipment. It will be noted that the change-over switch changes both motors and resist-

FIG. 4.

FIG. 4.—DIAGRAM OF MAIN CIRCUITS FOR STANDARD H.L. CAR EQUIPMENT AT 600 AND 1,200 VOLTS.

ances from series to parallel or *vice versa*. While such a scheme is quite satisfactory for lower voltages, especially for car equipments, it is generally considered to be better practice so to arrange the motor circuits of high-voltage equipment as to effect all changes possible by means of unit switches, sometimes using them for reversers as well, especially for large locomotives.

(To be concluded.)

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

SPAIN.—A recent Spanish Royal Order provides that the reduced import duty of 10 centimos per 100 kilograms, net, prescribed by the Royal Decree of January 1st, 1916, in respect of iron and steel scrap is suppressed, so that such scrap can now be imported into Spain free of duty. A further Royal Order provides that the export duty of 100 pesetas per 100 kilograms, net imposed on zinc in bars, lumps, cake, and scrap by the above-mentioned Decree is also suppressed.

UNITED KINGDOM AND CERTAIN FOREIGN COUNTRIES.—A Supplement to the *Board of Trade Journal* of February 17th contains complete lists of articles which are prohibited to be exported from the United Kingdom and certain foreign countries, viz.: Denmark, France, Greece, Italy, Japan, Netherlands, Norway, Portugal, Roumania, Russia, Spain, Sweden, and Switzerland. This Supplement, which embodies information received by the Board of Trade up to February 14th, replaces that issued by the Board on October 28th, 1915. Copies may be obtained from Messrs. Wyman & Sons, price 3d., post free 4d.

EAST AFRICA PROTECTORATE.—By an Ordinance dated December 18th, 1915, the export duty on rubber, other than plantation rubber, exported from the East Africa Protectorate has been reduced from 10 per cent. *ad valorem* to 4 per cent. *ad valorem*.

MEXICO.—Information has been received at the Board of Trade, through the Foreign Office, that the Mexican Constitutional Government, having decided not to recognise the Mexican Consuls who held office during the Huerta regime, desires to draw the attention of exporters residing in places where there is no Mexican Consul authorised by the Constitutional Government to exercise Consular functions, to the provisions of Articles 54 and 55 of the Mexican Customs Regulations. The following is a translation of these Articles:—

Article 54.—In places where there is no Mexican Consul or Consular Officer, the shippers should make out their invoices in triplicate only (in other cases four copies are required); and in other respects in accordance with the regulations established in the preceding Articles of the Customs Regulations. Shippers are to forward on the same day, through the local post-office in registered envelopes (Sec. 11 of Article 6 of the Postal Union), one copy of the invoice to the Head Office of the Customs in Mexico, and another to the Collector of Customs at the Mexican port to which the goods are being dispatched.

The shipper must be careful to obtain from the postmaster the receipts for the registered letters, which receipts he must transmit to the consignee in the port to which the goods are dispatched. The consignee, in turn, must present them to the Customs house with the third copy of the invoice on making the request for clearance.

The fact that the certification of the invoices may have been performed by the Consul of some friendly nation does not exempt the shipper from the obligation of complying with the provisions of this Article.

Article 55.—Failure to produce an invoice certified by the Mexican Consul or the receipts for the registered letters which, in accordance with Article 54, are required to be presented to the Customs house by the consignee of the goods, will be punished by the collection of double Customs duties on the goods imported; and in this case the specification of the goods in the corresponding Petition for Clearance will not require to be made, as this must be made by the examining Customs-house officer at the moment of clearance, when the Collector of Customs must be personally present, whatsoever the rank of the Customs house may be.

The same penalty will be applied in the case of goods exempted from the payment of the duties to which they are subject by the Tariff.

BRAZIL.—Various changes have been made in the Brazilian tariff by the Budget Law for 1916, including the following:—Incandescent electric lamps with carbon or metal filament are to pay 2 milreis per kilog. (gross weight). The surtax of 10 per cent. (paper) on the registration charge (*expediente*) on duty-free goods is maintained in force. As in previous Budget laws, the Government is authorised (1) to levy, for the benefit of a port improvement fund, a tax not exceeding 2 per cent. (gold) upon the official import valuations—to be levied at the Customs houses at Rio de Janeiro, Recife, Bahia, Rio Grande do Sul, Maranhão, Ceará, Rio Grande do Norte, Parahyba, Espírito Santo, Paraná, Santa Catharina, Matto Grosso, Alagoas, Parnahyba, Aracajú, and Pará; and (2) to levy a tax of from 1 to 5 reis per kilog. on merchandise loaded or discharged at Brazilian ports, according to the value of the goods, when proceeding from or destined for other ports. Exemption from Customs duty is accorded to machines and their accessories for new freezing establishments. A reduced duty of 8 per cent. *ad valorem* is payable on the following, when imported on the requisition of a State Government or a Municipality for works undertaken by them:—Apparatus and accessories destined exclusively for the industrial application (power, light, and heating) of alcohol; material for the first public installation of light, power, water supply, and other public services, and articles for the improvement and maintenance of electric tramways; machines and accessories for first installation for certain industries.

Commercial Travellers' Samples.—The duty-free admission of goods intended for re-exportation, subject to the deposit of the amount of duty payable, or to the furnishing of adequate guarantees is extended to samples imported by commercial travellers, if the samples are accompanied by a Consular certificate issued in the country from which the samples are imported, and if all the samples contained in each package are properly specified in a detailed note. The "expediente" charge is in this case reduced to 5 per cent. Catalogues, prospectuses, posters, and showcards of any kind are, if containing prints, to be subject to half the duties fixed in Tariff No. 604 (2nd section, & Note)* if their sole purpose is to advertise industrial products; articles suitable for advertisements or propaganda of such products (such as small knives, pencil-holders, cigar-holders, &c.) shall pay the duties fixed for such articles in the Tariff, with a reduction of 50 per cent., provided they are not intended to be offered for sale and that their use (as advertisements, &c.) is indicated on the articles.

Payment of Import Duties.—The Government is authorised to levy import duties on all goods in the proportion of 40 per cent. in gold and 60 per cent. in paper, thus abolishing the provisions of earlier Laws regarding the proportion of duty payable in gold.

* The duty under the second section of No. 604 is 3 milreis per kilog. The Note provides that prints gummed on cardboard for posters and advertisements shall enjoy a rebate of 30 per cent. of the duty.

EVEN in normal times the difficulty of ascertaining the exact character and personnel of companies and firms with which or whom there were opportunities of doing business occasioned a certain amount of trouble and anxiety to practically every British manufacturer. The liberty and freedom which have always characterised the conduct of trading operations in the United Kingdom have encouraged privacy, and too frequently that privacy has been abused. In respect of limited liability companies, there were facilities available for examining lists of shareholders and their individual holdings, but even then it was not possible easily to discover whether the real parties were concealed behind nominees bearing names which excited no suspicion. In the case of private firms, however, it has always been practically impossible, save through private sources, to find out as much as could be ascertained in the case of companies, and private agents might be representing and selling the products of those with whom, had the purchasers known the real facts, they would have flatly declined to have relations. We believe that in the foregoing we have expressed the peace-time reflections of many a business man engaged in the electrical, engineering, and hardware trades and industries. The secrecy and some of its undesirable consequences may have been more or less inevitable drawbacks of our commercial system, and they cannot easily be avoided unless all business transactions are to be so restricted, controlled, and hide-bound as to interfere with the free play of business initiative and enterprise. Hundreds of men who have built up great, necessary, and successful businesses never would have engaged in trade at all had it been required that their operations should be conducted in the full glare of publicity. So long as they conducted their transactions on sound and honourable lines, keeping to their contracts, and paying their debts, of what concern was it to anybody else who was or was not interested in the profits or who did or who did not pull the wires? And for the sorting out of the undesirables it was for traders to establish as perfect as possible an intelligence service, and failing the efficiency of such service, or indisposition to make use of it, Carey Street revelations and a needlessly large percentage of bad debts were sometimes the ultimate reward. Yet the most efficient intelligence service conceivable respecting either firms or companies cannot afford us complete immunity—in all businesses we must run risks and try to look pleasant, cutting our losses as philosophically as we can.

But in war-time, when we are engaged in a deadly struggle with a nation which has striven to undermine the industries of our Empire in ways which have been a revelation to most of us during the last twenty months—much as we thought we knew before—there enters an entirely new factor which inevitably seriously affects our most elementary business considerations. Under such exceptional circumstances sentiment will assert itself even in our trade affairs, and if we intend to prevent certain lines of foreign manufactures from having so free an entry as hitherto, we shall have to do a good many things

THE UNIVERSAL ELECTRICAL DIRECTORY

(J. A. Berly's).

1916 EDITION

READY.

H. ALABASTER, GATEHOUSE & CO.,
4, Ludgate Hill, London, E.C.

for which we have not yet made any definite plans. Before the war it mattered far less than it does to-day who was who in the electrical trade, and if we mistake not it will continue to matter very much indeed after the war. Nobody really British to-day wants to touch with a long pole any business house in which there is reason to believe enemy influence to be present. Are there not special Acts of Parliament and fears of big penalties turning aforetime miserable sinners into the most patriotic of saints? But everybody who knows now of the activities of German agents in the past, of the way in which offices of German concerns have been opened under the most innocent sounding names, and how foreign supplies have been sold by concerns having British titles, is eager that there shall be safeguards provided for the future. In recent months these foreign connections have taken a great deal of tracing out and unearthing and extirpating, whether by Government departments, by trade associations, or by privately instituted investigations and action. In the interests of the future of British industry, nay, more than that, of the future of the British Empire and the world civilisation for whose cause it struggles and pours out its life-blood and its wealth to-day, we hear a clamant voice calling for preventive measures. What should those preventive measures be? It is for our legislators in the last resort to say; but in the first instance suggestions should be conceived in the brain of industry and trade, and they should be urged tactfully, intelligently, and forcefully upon the minds of legislators before it is too late. We have set up new Government departments during the war, and though even these are sometimes lamentably short of information, they have an organisation and system and an abundance of material which should not be scrapped at the end of the war, but should be utilised in the most efficient manner possible in ways in conformity with future national policy whatever that is destined to be.

There are in the world a few querulous people—some of them are even to be found within the confines of the electrical trade—who appear to regard editors as possessing a sort of superior intelligence for sorting out the chaff from among the wheat. Editors ought to black-list firms and companies though the law allows them to trade! They ought to publish lists of private and other parties who are even only suspected of enemy influence! And so on. We have alluded to our correspondence bag, with its rejected epistles, more than once during the war; we do not think we shall ever be tempted to publish all that it contains—our correspondents need have no fear, they need not write to us now reporting change of mind, for what we have done we have done. But all this correspondence, and some other things besides, have proved beyond doubt that the electrical industry at any rate has not been overburdened with trade associations which made it their business to collect trade information, or such associations would have received innumerable inquiries that have come to us. In view of the lack of organised facilities for such collection, we feel inclined to favour such measures as the Registration of Firms Bill that Lord Southwark brought before the House of Lords again last week. We have no more sympathy with grandmotherly and meddlesome legislation to-day than we ever had before, but we believe that the effective working of such a scheme, if it can be conducted without restriction or limitation of legitimate private enterprise, will be a boon to traders who want to know things about those with whom they wish to have business dealings, even if the information in regard to firms be limited to what is ascertainable under limited liability law. Lord Southwark explained that the principle upon which the proposed Bill was based was that there should be an effective registration of all persons and

firms trading in this country in names other than their own. Foreigners would not be prevented from trading, but they would be compelled to disclose their names. In addition to this being a concession to the sentiment which will undoubtedly prevail for some time after the war, it will also prevent secret partners escaping their proper liabilities. We should hardly expect so limited a proposal to meet with serious objection. We observe that the Government which turned the idea down a few months ago, because there was not time to deal with it, is still unable to promise that it will be proceeded with in "another place," but it is something gained to have the Bill referred to a Select Committee. We read that one peer of the realm held that "a man ought to be allowed to manage his own business in his own way," and if that were a complete statement of the matter we should agree with him, but it is not so by any means. Ordinary mortals have learned things in recent days. Even Lord Loreburn plumps for the measure by saying that it is a straightforward course for business people to state their names to those who trade with them, and we approve his sentiment, born within us by painful experience in the electrical industry, even though he be a lawyer and supported by the Lord Chancellor who likewise sees no reason why a man should be ashamed of trading or of using his own name for the purpose. His lordship sees, as we do, and as new Government departments must assuredly see, that at the present moment a situation of difficulty is being dealt with which has arisen because no provision such as the proposed Bill exists upon the Statute Book. And yet no undertaking can be given in regard to progress in "another place"! We certainly should like to see the matter dealt with now if it were not regarded as so controversial as to absorb too much valuable Parliamentary time; but if that cannot be, it should be among the earliest trade measures to be passed in the first after-the-war Parliament.

Copper.

AN extraordinary state of affairs has arisen in copper circles within the last few weeks, chiefly as a result of the Government policy in interfering with the market by prohibiting all speculative transactions, under the Defence of the Realm Act. Since the market was reopened under the new regulation restricting transactions to *bona-fide* business, the liquidation of old speculative commitments to be completed by the end of May next, has been proceeded with, and rather exciting developments have ensued with prices fluctuating within a range of fully £25 a ton, and thus swiftly forced to new high records up to about £118 for cash delivery, which at one period last week commanded a premium of £6 a ton. The extreme lowest touched a few weeks ago was £93, with a short-lived lull in the demand. The new regulation has certainly enabled speculative holders to realise their commitments at huge profits, at the expense, of course, of the short interest whose position has been anything but comfortable.

This sequel of the new regulation was inevitable in view of the present famine conditions as indicated by the virtual disappearance of the warehouse stocks in this country. The object of the proclamation was doubtless to keep down prices by stopping speculation, but technical conditions were such that precisely the reverse has happened. There has been a constant demand from consumers for all descriptions of copper for early delivery, which tends to accentuate the present stringent conditions, and although there has been some reaction from the extreme figures recorded in the past week, there is no prospect of any material relief being forthcoming in the near future. In the absence of a free market, it is obvious that forward business on the part of dealers has been severely interfered with, which is calculated to aggravate the impoverished state of the market.

There are now under the new regulation virtually no facilities for "hedging" operations on the part of either producers or consumers. There is no denying the fact that the new conditions brought about by the Government interference are responsible for the drastic adjustment in the price of rough bar copper, which is more consistent with the phenomenally high level of value ruling for American fine copper, the latter having remained throughout pegged at upwards of £135. The huge premium on fine copper having thus been automatically reduced through the recent quick rise in standard copper, the position of American producers has, if anything, been strengthened by the prohibition of speculative dealings in this market, for the latter have in the past frequently interfered with their control. As hinted by an American authority, the copper magnates would similarly like the elimination of speculation in America so as to have transactions in the metals confined to direct negotiations between producers and consumers. There is no sign of a falling off in the huge consumption in copper, and unsold stocks are extremely reduced.

The Metropolitan E.S. Co. EXCEPTIONAL interest attaches to the report of the Metropolitan Electric Supply Co.'s annual meeting, to which we have devoted a considerable amount of space in our "City Notes" this week. It will be observed that, in spite of the adverse effects of the war, as manifested by the loss of 20 per cent. of the lighting revenue and an advance of at least as much in the price of coal, the company has increased its gross revenue by nearly 7 per cent., and has even recorded an increase in its net revenue, doing better, the Chairman stated, than any of the other electric supply companies in London, and carrying a larger amount to reserve than in any previous year. The improvement in the company's affairs during the last two years was due to the rapid development of the power supply, which showed an advance of 50 per cent. over the year before the war, while the returns since the beginning of this year indicate that the growth of this load is still progressing at an even faster rate. Moreover, the company has increased the price charged for power, without adverse effect upon the demand. In the face of these facts, some of the shareholders recently issued a circular to their fellows in which, according to the Chairman, the complaint was made that the dividend had fallen from 10 per cent. in 1905 to 3 per cent. for 1915; the Chairman justly pointed out that this heavy drop was due mainly to the sale of the Marylebone section of the undertaking, and that the shareholders had received the bulk of the price paid for their goodwill, to the amount of no less than £6 for every £10 share; naturally they could not have it both ways. Then came the metallic-filament lamp, which so severely hit those supply authorities that were dependent upon a lighting load, and their dividends fell until 1911 (the year in which Mr. Highfield was appointed manager); since then their profits had improved year by year. Three of the directors had resigned, because they disapproved of the proposed internal reorganisation of the company, and the imposition of higher charges for power supply; the board of directors had unanimously decided to separate the duties of engineer and manager, as in the early days of the company, but when the delimitation of the respective spheres of duty of the engineer and of the manager came under consideration, a split took place. Mr. Gregory, one of the signatories to the circular, pointed out that the directors in whose ability they had the greatest confidence had resigned, together with the general manager.

Mr. Tuckett, one of those directors, gave a number of quotations from reports drawn up by Mr.

Leverton Harris and the Chairman, Mr. W. H. Cripps, which certainly embodied views which, at this date, can only be characterised as astounding; assuming that the load factor and other conditions are reasonable, to assert that a charge of £4 per kw. and ½d. per unit for power is not remunerative is to court the ridicule of every competent manager, and the statement that all power prices should be raised to a minimum of 1½d. per unit is equally absurd. We cannot too strongly protest against this highly reactionary attitude towards the power load, which stands condemned in the chairman's own speech, wherein, as we have indicated above, he showed that in spite of the heavy loss on the lighting revenue and the increased cost of coal, the rapid development of the power load had enabled the company to show better results than any other London company! What could be more astonishing, in view of the mass of experience and information at his command, than the statement of the chairman, in spite of his lengthy and distinguished association with electricity supply, that he could find no evidence that the works cost of generating a power unit was less than the cost of a lighting unit, and that the destination of any unit seemed quite immaterial, as regarded the cost of its production? And what of the incidence of the capital charges? We repeat that we are astounded that such views should be held by the chairman—or any director—of an electricity supply undertaking. It is not a question of opinion, but of fact—facts well known to every electrical engineer, and perfectly familiar to the manager of any similar business. We do not wonder that Mr. Highfield should feel compelled to dissociate himself from such views, and we think it is very plainly manifest that the action of the shareholders in calling for an investigation of the management of the company by the board of directors is thoroughly justified.

**The I.E.E.
and
Alien Enemy
Members.**

ON Monday last the Council of the Institution of Electrical Engineers dispatched to all the corporate members an account of the recent proceedings in connection with the proposed expulsion of enemy members, together with a card bearing the four resolutions that were voted on at the informal meeting, to enable the members to express their views on each proposition. The proceeding is in the nature of an informal postal ballot, though under the Companies' Act, by which the Institution is governed, the "voting" has no legal value, and the result will only serve as an indication of the views of the corporate members as a whole to those who are present at the special general meetings that will follow. We have no doubt, however, that not only the Council, but also the members who are able to attend those meetings, will give due weight to the views of the majority, and that they will regard themselves as the medium whereby those views may be translated into action.

We were pleased to observe that, by overwhelming majorities, the informal meeting endorsed the views which we put forward in our issue of January 14th, and which are embodied in three of the resolutions. The fourth proposal is designed to perpetuate the exclusion of our present enemies, a question which was first raised at the special general meeting of March 1st; on this point the voting at the informal meeting was 2 to 1, a much less emphatic expression of opinion than in the case of the other items. It is, however, a matter of much less moment, for while the other decisions will take immediate and irrevocable effect, this one merely outlines a policy which in the future may be reversed at the pleasure of the members.

ELECTRICITY SUPPLY AT BALLATER.

As a result of negotiations which took place in 1913, between Mr. James Duncan of the firm of T. C. Smith & Co., electrical engineers, Aberdeen, in regard to the introduction of electric light into Ballater, this charming Deeside resort has since been provided with an up-to-date public electricity supply.

It was tentatively arranged that power should be obtained from the River Gairn, and a provisional order was applied for accordingly, but certain opposition being encountered

for the attendant in charge, forms part of the generating station.

Considering the climatic conditions which prevail in winter, Mr. M. K. Cooper, A.M.I.E.E.—the manager of the electrical department of Messrs. T. C. Smith & Co., who carried out the work—advised his firm to install Heenan and Proude water coolers in lieu of the ordinary tank water coolers. He has now had considerable experience of these coolers, and the results have been extremely satisfactory. Their chief advantages are that they produce a constant cooling effect which is practically independent of climatic

GAS-ENGINE PLANT AND MAIN SWITCHBOARD, BALLATER ELECTRICITY SUPPLY.

from the proprietors of the fishings in the river, Mr. Duncan determined to abandon the idea of employing water as the means of generating power, and to install instead a suction gas plant.

Previous to the advent of electric lighting, the streets of the burgh were illuminated by paraffin lamps, and the householders for the most part adopted the same means.

The generating station—a stone building—occupies a site near the railway station. In it are installed two 68-h.p. anthracite suction-gas plants and engines, by Messrs. Fielding & Platt, Ltd. The suction-gas producers are interconnected in such a way that either engine can work

conditions, and the space taken up by them is very much less than that taken up by tanks.

The whole of the electrical machinery is controlled from a switchboard consisting of the usual dynamo, battery and feeder panels. The dynamo panels are fitted with the necessary volt and ampere meters, shunt regulators and circuit-breakers.

The battery panel is fitted with two 200-amp. 19-way charge and discharge switches, an automatic cut-out and cut-in relay, two 200-amp. S.P.Q.B. knife switches, an integrating recording ampere-hour meter, and charge and discharge ampere-hour meters.

OVERHEAD MAINS AT BALLATER; MAIN DISTRIBUTION POLE ON THE RIGHT.

from either plant. The starting of each engine is by means of a high-pressure air self-starter, and the engines are fitted with heavy fly-wheels suitable for electric drives, and throttle governing, by means of which an extremely steady voltage is obtained. Each of the engines is directly connected by means of a flexible split coupling to a 42-kw. 220/300-volt compound-wound dynamo, with a single-pole switch direct on the dynamo to cut off the compound windings when charging the battery. These machines were supplied by the British Electric Plant Co.

A house, which has been erected on the lower floor

The main feeder panel contains four 200-amp. meters, and four 200-amp. D.P.Q.B. switches, and eight single-pole porcelain-handle fuses.

The battery was supplied by the Chloride Electrical Storage Co., and consists of 120 cells of Plantide type, with a capacity of 580 ampere-hours in five hours, or 696 ampere-hours in 10 hours. The plates are mounted in glass boxes; the wires leading from the regulating switches are suspended from the roof by special porcelain ceiling plates.

The mains and sub-mains, consisting of hard stranded copper wire, are carried through the walls of the power

station to a main pole, and thence overhead, throughout the burgh, on larch poles, being carried on cross arms and attached to insulators. The sizes of cables vary from 37/14 to 7/20. Where Post Office telephone and telegraph wires cross the route, underground cables are laid. On the top of each pole is a zinc roof, and a galvanised wire leads from

LEADING-IN WIRES, LIGHTNING ARRESTERS, &c. AT GENERATING STATION, BALLATER.

the roof to the bottom of the pole serving as a lightning conductor.

Lightning arresters have been erected outside the power station where the mains come out.

WIRE CRADLE CROSSING, OVER TELEPHONE LINE.

The street lighting is divided into four circuits. The consumers' connections consist of aerial braided wire, connected from the nearest pole either to upright, or swan-neck insulators, erected either on chimneys or walls; thence a pair of wires of the necessary size is led into a double-horn porcelain inlet, screwed into a galvanised tube terminating in a pair of ironclad fuses. It is worth

mentioning that the inlet pipe leading-in through the slates of the roof, is led through sheet lead, soldered to the galvanised pipe, which makes the roof absolutely waterproof. The porcelain double-horn inlet was employed to get over the moisture which, in the autumn and winter, gathers round the inlet and forms condensation, in course of time making an earth and ultimately a short. The double-horn insulator prevents this entirely, for the distance of the inlet is 4 in. and the wires are apart. When moisture gathers, therefore, it simply acts as on an ordinary upright insulator. Over one year has passed since the completion of the installation and no trouble has arisen.

The work of the erection of the plant, mains, and the wiring of houses started in January, 1914, and the opening ceremony was on December 24th of the same year. About 165 houses have installed electric light or power, including about 2,400 lamps.

The original cost of the installation amounted to about £6,000, which was borne by Messrs. Duncan's Electricity Supply Co., Ltd.

A similar installation for the town of Ellon, Aberdeenshire, was begun and completed under Mr. Cooper's supervision during the same period.

In conclusion, we are indebted to Mr. Cooper for the particulars and views of the Ballater installation.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

The "Perfect Burglar Alarm" System.

The ordinary electric burglar alarm employs contacts of various types fixed to windows and doors, by which a bell or other warning device may be rung, a simple switch providing for the setting in action of the installation. The principal drawback to this system has been the question of maintenance; burglar-alarm installations are generally fitted upon premises where there is nobody of sufficient technical skill to look after them properly, and little care is taken to see that the system is in working order.

FIG. 1.—CONTROL GEAR WITH COVER REMOVED, "PERFECT BURGLAR ALARM" SYSTEM.

Moreover, the modern burglar is an expert electrician, who would never think of attempting to force an entry into a building unless he had assured himself that he had removed every means of creating any alarm.

One of the systems designed to overcome these objections is that now made by the PERFECT BURGLAR ALARM CO., LTD., of 53, New Broad Street, E.C. This company recognised that the only method of dealing with the question of maintenance was to provide a method of automatic testing, performed daily by the owner of the premises upon which the installation was fitted. This is effected by a special control gear, illustrated in fig. 1, which has three principal positions—"normal," "set," and "alarm," with an indicating pointer to the control handle. During the daytime, when the installation is inactive, the indicator points to "normal." Before the premises are closed the pointer is turned to "set," when, if any short circuit or other defect exists in the detection devices or the wiring thereto, a warning buzzer is sounded. With the controller at the same position, each of the detection devices may be tried by hand, when the buzzer will operate, if all is in order. Upon leaving the premises, a small push fitted outside the entrance is pressed, which removes the testing features in the control gear, and sets the alarm for the night. Once the push has been pressed, nothing whatever can restore the

installation to an inactive position, and nobody can get into the building without due alarm being given. In the morning entry can only be effected to the accompaniment of the ringing of the alarm bell, but at such hours this would not be objected to, and it furnishes proof of the effective working of the bell and whole installation. The bell can be instantly stopped by restoring the indicator to "Normal."

The company have also provided for a forgetful owner who may omit to set his alarm before leaving the premises. Contacts are fitted to the ordinary door locks of the building, so that any attempt to lock the doors without having set the alarm and pressed the push results in the outside alarm bell ringing furiously. In addition, they can also provide an indicator for police purposes, which shows, upon a second push being pressed, that the installation is in the set position.

The detection devices adopted by the company are very effective. The principal of these is the system of concealed floor contacts, which are laid over large patches of floor surfaces in entrances, lobbies, staircases, and around safes and other vulnerable positions. There are also special devices for protecting windows and skylights, doors and other possible entrances. In some of these, the use of nickel-steel wire has been adopted to overcome the objection due to variation in expansion and contraction by temperature changes. All these devices are placed so that it is impossible to avoid them. The control gears are built up in cast-iron protecting boxes, and the alarm bells in weatherproof enclosed cases with invisible hammers. The system can be installed by electrical contractors.

The "Marlor" Cord Grip.

MESSES. STURGE & BAKER, of Premier Works, Sheepcote Street, Birmingham, are placing on the market a new pattern of cord-grip—the invention of Mr. Sturge and Mr. Marlor, of the Manchester Electricity Department—which is intended to overcome the drawbacks of the usual pattern of wedge-grip having a sharp upper edge over which the flexible, owing to continual bending, usually comes to grief.

The "Marlor" device consists of a specially-shaped Litholite or hardwood cap, which is tapped to screw on to the top of the ordinary lampholder in place of the usual collar for securing the

FIGS. 2 AND 3.—SECTIONAL AND EXTERIOR VIEWS OF "MARLOR" CORD GRIP.

wood cone: the flexible is threaded through it, and its rounded entrance offers no sharp edge for acute bending of the flex. The cord is not "gripped," but locked, by being threaded through, that no strain comes on the terminals.

The firm are also introducing a flex. preserver, consisting of a hood to slip over lampholders wired in the ordinary way, the bell-mouthed entrance saving the flexible from acute bending, as in the case of the previously-mentioned device.

A Parsons Electric Generating Set.

The electric generating set, comprised of internal combustion engine and dynamo on one beplate is now a more or less commonplace plant, but the illustration, fig. 4, shows that the convenience of such plant can be very greatly extended by a careful design incorporating all the accessories of such a set, making the whole plant, therefore, absolutely self-contained, and also portable. The PARSONS MOTOR CO., LTD., Southampton, have recently been supplying an exceedingly large number of these plants, both of this size and also very much larger.

The plant in question is of 12 kw. output, and the paraffin engine is of the maker's regular type, with all the well-known features of pump lubrication and oil cooler, high-speed sensitive governor, variable timed magneto ignition, forced water circulation, oil-pressure gauge, oil-level gauge, and we may also mention that the pistons and connecting rods are removable through the crank chamber doors, without disconnecting any of the cylinders or pipes.

The dynamo, in this case is somewhat hidden by the instrument board, and the latter comprises ammeter and voltmeter, D.P. main switch, two single-pole main cut-outs, voltmeter switch, six double-pole distributing switches, 12 single-pole cut-outs, and a shunt regulator. These are mounted on a superstructure formed of channel iron. The radiator has removable top and bottom headers of cast aluminium, so that all tubes can be got at if necessary. The air blast through this radiator is furnished by a suitable fan, the efficiency of which is greatly increased by its

operating in a casing as shown. The fan is driven by a flat belt running over pulleys of useful diameter.

The fuel tank will be seen mounted at the top of the frames: in some recent plants it has been placed a little lower. The necessity of preventing any overflow from the radiator reaching the dynamo has not been lost sight of, and not only is the overflow pipe carried well clear, but a tray is fitted beneath in order to catch any slight leakage that may occur in time. As a matter of

FIG. 4.—PARSONS 12-KW. SELF-CONTAINED GENERATING SET.

fact, the radiator is not actually over the dynamo at all, but between it and the engine.

The engine itself is fitted with a large and heavy fly-wheel, and the governing is exceedingly good, usually within 2 per cent. either way.

The speed of the engine and dynamo is moderate, viz., 900 R.P.M.

LEGAL.

SOLDIER ELECTRICIAN'S CLAIM AGAINST HIS EMPLOYERS.

IN the King's Bench Division, on March 23rd, before Mr. Justice Bray and a special jury, an action was brought by Mr. Thos. Wm. Geo. Budgett, head foreman in the electrical department of the Stratford Co-operative and Industrial Society, Ltd., and now serving in the Army Service Corps, against the Society, claiming a declaration that he is entitled to recover, during the period that he is with the Forces, half wages from the Society. The defendants denied any contractual obligation.

Mr. Powell, K.C., and Mr. Preedy were counsel for the plaintiff, and the defendants were represented by Mr. Rose Innes, K.C., and Mr. Morle.

MR. POWELL, K.C., in opening the case, said that soon after the outbreak of the war the defendant Society, like a good many other concerns, decided to do what they could to induce men to join the Army, and the directors passed a resolution that they would pay wages as follows to men enlisting:—Half wages to married men, half wages to single men with dependents, and 5s. a week to single men without dependents, it being provided that the money should be invested in the Society's capital. Notices were posted up to this effect, and the plaintiff, with numerous other servants of the Society, enlisted. The plaintiff was married, with three children; and he was the head of the electrical department, and was formerly a foreman electrician in the service of the Central London Railway. In February, 1915, Mr. Budgett told Mr. Banks, the Secretary of the Society, that he thought of joining the Army, and Mr. G. Banks told the plaintiff that, of course, the notice applied to him as well as to the other employees, and a form of authority was written out for the plaintiff's wife to receive half wages. Mr. Banks gave the plaintiff an excellent character in the following terms:—"We understand that Mr. Budgett is anxious to join the Colours. He has been in our employment since September, 1906, and has in every way given satisfaction. He is honourable, honest and trustworthy, and one to be trusted with any position of responsibility." The plaintiff joined the Mechanical Transport Section of the Army Service Corps. There was also a reference from Mr. W. H. Coxcroft, the works manager, to the effect:—"Mr. T. W. Budgett started here in September, 1906, as foreman

over the electrical department. He has had charge of the electrical installation from the commencement, and has carried out many complete equipments . . . &c." Some time after the plaintiff had gone, his wife received a letter asking if her husband had joined up, and she kept it until Mr. Budgett came home, and then he replied giving the facts, and said he felt much hurt at the inquiry that the Society had made. Somebody on the Committee (said Counsel) must have got the idea that he was likely to do better, and the Committee wrote to him asking what his pay was, and what allowance he was making to his wife. He replied that he enlisted at 6s. per day, and was paying his wife 4s. 6d. per day. On May 26th the Committee met, and the result was that Mr. Banks wrote to the plaintiff to say that the Committee had decided not to grant the war allowance in his case, as by joining the Colours he had benefited his position as compared with the post held with the Society. The plaintiff appealed for reconsideration of his case, saying that his wages before the war were £2 10s. a week, and he enlisted at 6s. per day, so that he was no better off, and if they could not pay him half wages, he asked them to make up the difference. The Committee declined to depart from their previous decision.

MR. POWELL, concluding his address to the jury, suggested that some firms had arranged to pay men joining the Forces half wages, believing the war would have been over soon, but as it had lasted longer than they thought, they found they were having to pay more than they expected. If there had been any legal obligation on the plaintiff to join the Army, the notice of the Society would not be a promise that could be enforced, but there was no legal obligation at the time at all, and the Act relative to single men had not then been passed. Counsel also suggested that the Society was benefited by men joining the Army, having regard to the possibility of a raid on our coasts.

MR. ROSE INNES, on behalf of the defendants, said that the notices were undoubtedly posted up, but in order to make the notices a contract, there must be acquiescence, and the plaintiff was distinctly told that the notice would not apply to his case, but only to the cases of men who suffered financial loss by joining the Army.

The evidence of the PLAINTIFF, who was at Bulford Camp, was read in Court, and in this he deposed that he told Mr. Banks he wished the money to be paid to his wife, and Mr. Banks promised that this should be done.

Cross-examined: The separation allowance to his wife was £1 3s. 6d. per week, and he allowed her 4s. 6d. per day out of his pay. Mr. Banks never told him that he was not entitled to half wages, and he (Mr. Budgett) suggested that the action of the Society was the outcome of petty spite by some of the members.

MR. ROSE INNES, K.C., said that the object of the notice exhibited by the defendants was to secure that if a man joined the Army he should not be out of pocket by so doing. The authority given by Mr. Banks to the plaintiff's wife was to draw dividends upon a share in the Society, and not to draw half wages. In fact, half wages for six weeks were paid on an authority in the plaintiff's handwriting, but this was a mistake.

MR. GEO. LEONARD BANKS, secretary of the defendant Society, said that the plaintiff told him that he proposed to join the Army Service Corps (Mechanical Transport), and witness told him that if he did so he would get more than a soldier's pay. Mr. Budgett said he would get 6s. a day, and witness said, "If that is so, you will not be entitled to the half wages allowance provided by the Committee," and plaintiff answered, "I quite understand that." The plaintiff also attended a meeting of the Committee, at which the chairman told him that he was not entitled to half-pay.

Cross-examined: WITNESS said the war allowance had not been granted to men joining since May, 1915, because of the prohibitive cost.

The jury eventually found that the plaintiff was not informed before he enlisted that he would not receive the allowance mentioned in the defendants' notice, and upon this the plaintiff was given judgment, with costs.

MR. JUSTICE BRAY said that the only legal question in the case was whether this was a good contract between the plaintiff and the defendants, and he was satisfied that it was a good contract, and that there was ample consideration for the money. He gave the plaintiff the declaration that he claimed, to the effect that the plaintiff was entitled to £1 2s. 6d. per week, and judgment would be entered for him for what was due to date, and the judgment would be with costs.

BRITISH THOMSON-HOUSTON CO., LTD., v. STONEBRIDGE ELECTRICAL CO., LTD.

MR. JUSTICE YOUNG, in the Chancery Division, delivered his reserved judgment on the summons taken out by the plaintiffs in this action for further and better particulars of the defendants' particulars of objection to the plaintiffs' patent.

His LORDSHIP said that the plaintiffs asked that the defendants should identify what matters they said were common knowledge and what were public knowledge. In his opinion, the plaintiffs were entitled to the particulars they asked for. The defendants had very ingeniously for the first time endeavoured to set up a pleading describing as common knowledge that which really was public knowledge. It had been laid down that particulars should not be relied upon as to what was common knowledge if it was of a particular art or science, and for the obvious reason that it was in the interest of the public that both time and expenses should not be unduly extended. In his opinion, however, where a defendant pleaded public knowledge, if particulars were not given a burden would be laid upon the plaintiff, and he would come into Court unprepared to meet the case that was made against him. He

thought, therefore, the plaintiffs were entitled to the order that they asked for, and the costs of the summons would be theirs in any event.

MR. FROST asked for leave to appeal if necessary, which was granted.

FARRELL v. BLOXAM.

At the County Antrim Assizes, on March 22nd, before Mr. Justice Pim and a special jury, the action in which Alexander Bryces Farrell claimed £1,000 damages from Thomas W. Bloxam, city electrical engineer, Belfast, for alleged libel and slander, came on for hearing. The details are fully reported in the *Irish News* and *Belfast Morning News*, from which we extract the following particulars:—

In his statement of claim the plaintiff set forth that at the date complained of he was resident superintendent of the central electrical station, East Bridge Street, and had been 15 years in the service of the Belfast Corporation. He alleged that the defendant falsely and maliciously spoke of and concerning him in respect of his office as superintendent on or about October 29th, 1915, to Mr. John Tyrrell and Mr. James A. Duff, at the central electrical station, the following words:—

Main feeder cables in the tunnel in sub-way were supported and clamped in a manner likely to destroy the cable, and be a danger of fire in the station, and Farrell was responsible for this. Cheap cotton "flex" was used where cables should have been used as a "lead" for current to a lamp at a small auxiliary engine, and Farrell was responsible for this. Farrell is irreconcilable, and causing disorganisation in the station, and is a danger to the station, so much so that I would prefer to carry on the next two months without anyone rather than with Farrell.

The plaintiff alleged that the words meant that he had been guilty of gross misconduct and negligence in the discharge of his official duties, and was incompetent and unfit to be superintendent of the electrical station, and was deliberately interfering with the harmonious working of the station.

The defendant, in his defence, denied that he spoke or published the words complained of; and he said that in their ordinary and natural signification they were not capable of the defamatory meaning alleged; and that they were spoken and published on a privileged occasion, *bona fide* and honestly believing them to be true, and without malice.

MR. J. CHAMBERS, K.C., opened the case for the plaintiff. He said that he thought he would be able to show by the evidence that the allegations were not only wholly baseless, but that they were baseless to the defendant's knowledge, and were made with the ulterior motive of injuring the plaintiff. Both parties entered the employment of the Corporation in 1900, and Mr. Bloxam was appointed engineer-in-chief in 1907, and the plaintiff became his second in command. The defendant recognised plaintiff's capacity and ability, for on his recommendation plaintiff was appointed resident superintendent engineer in 1907. In 1912 defendant wrote a testimonial in plaintiff's favour when he was applying for the position of resident electrical engineer at Tanbridge Wells. At the instance of a member of the Belfast Corporation, an inquiry into the working of the city electrical undertaking was instituted in January, 1914. Plaintiff had nothing whatever to do with the bringing about of that inquiry, and did not know he was going to be examined as a witness. When the inquiry opened, Councillor Curley, at whose instigation mainly the inquiry had been instituted, made this remark: "In the hurry I omitted to mention that we should make it a *sine qua non* that any person brought here as a witness to give evidence must be protected from persecution or dismissal if he tells the truth." Mr. Bloxam then said: "If nobody is to be penalised after this inquiry is over I think I am justified in asking for the same to apply to the manager. If he is to bear the result of his action, others must be prepared to do the same." After further observations had passed, Mr. Bloxam said: "If any members of my staff are defaulters in respect to the support of the manager, those men shall be summarily dealt with." The jury would be astounded to hear that practically every man who gave evidence at all reflecting on the management of Mr. Bloxam ceased to be employed in the electricity works within a year from the time of the inquiry. Farrell was the last to go, and if he (counsel) had to establish malice he would willingly accept the onus. Mr. Farrell spoke the truth, as he had sworn to do. His evidence formed rather a grave indictment of the management of the electricity station. From that time his life was made a burden to him in the works, and everything possible was done to make it hot for him. Continuing, counsel said Mr. Bloxam did all in his power to goad plaintiff into resigning his position, but without success. In June, 1915, a joint Sub-Committee was appointed, and they recommended that there was no use in proceeding further with the reorganisation of the electricity department unless Mr. Bloxam was asked to resign. When the Sub-Committee's report came before the Corporation that body, by a majority of one, ignored the recommendation.

On July 15th a turbo-dynamo burst and it was a mercy that the whole place was not blown up. On August 22nd a serious fire broke out at the station, and Mr. Bloxam tried to make plaintiff responsible for it, but a Board of Trade inquiry showed that it was due to an escape of gas from coal—a sort of spontaneous combustion that had been going on for some time, and that Mr. Farrell was in no way responsible for it. On October 29th defendant sent a letter to plaintiff, in which he said he reluctantly came to the conclusion that it would not be in the interests of the department to retain Farrell's services, and he asked him to vacate his position on the 6th prox. That letter went before the Electricity Committee on November 3rd, and, without making the slightest inquiry from Farrell, without communicating with him in any way, they confirmed the dismissal. The slanders complained of

were alleged to have been spoken immediately after the plaintiff had received his notice of dismissal.

PLAINTIFF was called and gave evidence in the course of which he said that his evidence at the inquiry was unfavourable to the management. The chairman of the Committee asked him to prepare a report with reference to extensions to the power house, and as to the adequacy of the transforming plant at the sub-station. He prepared it. He asked a firm of engineers for some particulars, and when their reply came into Mr. Bloxam's hands, he said to witness, "What have the reports of the Committee got to do with you? You attend to your own work." Later Mr. Bloxam reported him for insubordination. At the Committee meeting the chairman told witness it was none of his business to get out reports: it was Bloxam's duty. Subsequently he apologised to Mr. Bloxam. After the committee meeting, Mr. Bloxam sent for him and told him not to leave the station, night or day. Witness could not get out for luncheon for three days, but after that the old regulations prevailed. Evidence was then given by the plaintiff as to the defendant directing him to remove the contents of his workshop from the residence as soon as possible. The lathe was a small thing, and had been in the shop for seven years to the knowledge of Mr. Bloxam. It in no way interfered with the working of the place. Witness denied that the bursting of the turbine dynamo had anything to do with the working of the electrical side of the establishment for which he was responsible. The fire was due to spontaneous combustion in the coal bunker. In both cases Mr. Bloxam endeavoured to put the blame on witness and his department.

On March 23rd plaintiff continued his evidence. Mr. J. A. Duff, a member of the City Council, and Alderman J. Tyrell, who was chairman of the tramways and electricity at the time in question gave evidence, and at the conclusion of the plaintiff's case, Mr. Henry, K.C., for the defendant, asked his Lordship to rule that the alleged slander was spoken on a privileged occasion, and also that there was no evidence of actual malice. His Lordship ruled that the words were spoken on a privileged occasion, but refused to rule on the question of malice. Mr. Henry then opened the case for the defence, and on the following day Mr. Bloxam gave evidence. The judge having put a number of questions to defendant, the Court rose for the day.

In summing up on the 25th inst., the judge said that the plaintiff asked the jury to say that his reputation had been maliciously attacked, and that he must suffer bitterly if he did not put himself right with the public. The reputation of the defendant was also at stake, and the Belfast Corporation was also involved. The big question of the case was: did Mr. Bloxam make his report about Mr. Farrell to Alderman Tyrell and Councillor Duff merely to benefit the electrical department, or was there any other motive in his mind? Before the time of the inquiry there did not seem to be anything strikingly unpleasant in the relations of the parties. Plaintiff, who gave a good deal of evidence at the inquiry, was a man who evidently thought a good deal of himself. He had been asked to make a report, and for that purpose had applied to Messrs. Babcock & Wilcox. The reply went to Mr. Bloxam, who asked Mr. Farrell for an explanation, and according to plaintiff Mr. Bloxam shook his fist at him. Proceeding, his Lordship said the gravamen of the charge was the accusation by Bloxam to Alderman Tyrell and Councillor Duff that Farrell was a danger to the station.

The questions submitted to the jury, with their answers, were as follows:—

1. Did the defendant speak the words complained of?—Yes.
 2. Did he speak them honestly believing the same to be true?—No.
 3. Do the said words mean that the plaintiff had been guilty of gross misconduct and negligence in the discharge of his official duties, and was incompetent and unfit to be superintendent of the electrical station, and was deliberately interfering with the harmonious working of the said Belfast electrical station?—Yes.
 4. Were the words spoken maliciously?—Yes.
 5. What damages, if any, should the plaintiff be paid?—£500.
- A verdict for the plaintiff was entered accordingly.

FREEMAN v. EDWARDS BROS.

In the King's Bench Division, on Monday (March 27th), Mr. Justice Shearman heard the settlement of this action, in which the plaintiff claimed damages for alleged slander. Mr. Harold Simmons, for the plaintiff, said that the action had been settled. Plaintiff answered an advertisement and saw a man named Davis, who offered him a situation provided he deposited £25. A business in electrical fittings was opened at Kentish Town, and Mr. Freeman was appointed manager at £2 6s. a week. Davis was an agent for the defendants for the supply of electrical appliances, and the business, as far as counsel knew, was really carried on by means of deposits from other people. Davis gave orders to the defendants in the name of the plaintiff, and when plaintiff's salary became in arrears Davis persuaded him to purchase the business, most of the purchase price being the arrears of salary and plaintiff's deposit. In April, 1915, the defendants wrote to Mr. Freeman for payment of the debt for appliances ordered by Davis, which plaintiff, naturally, repudiated, and correspondence ensued in which it was suggested that the plaintiff had improperly obtained the goods. However, since then they had realised the position in which the plaintiff was when the goods were ordered, and they now desired to withdraw all imputations against the plaintiff. The record would be withdrawn, each party to pay their own costs.

Counsel for the defendants agreed to the settlement, remarking that when they wrote the letters they believed what they said was correct. Since then they had realised that they had been wrong.

His Lordship allowed the settlement to be recorded, and said he thought the difficulty arose through a misapprehension.

GERMAN TELEPHONE CO.'S CONTRACTS DISSOLVED.

In the King's Bench Division, on Monday, Mr. Justice Bray heard an action brought by the Lancashire and Yorkshire Private Telephone Co., Ltd., who carry on business at Queen Street, Albert Square, Manchester, against the Telefon and Telegraphenbau Gesellschaft G.m.b.H. and Mr. H. Fuld, of Frankfurt-on-Main, Germany, asking that the Court should grant declarations to the effect that certain agreements between the plaintiffs and the defendants were determined by the outbreak of the war.

For the plaintiffs Mr. Disturnal, K.C., and Mr. Green appeared, and the defendants did not enter an appearance.

MR. GREEN, in opening the case, said that the defendants were manufacturers of an apparatus for telephonic communication in works and offices, and before the war broke out they secured the formation in this country of companies to acquire from them, and let out on hire in different parts of the United Kingdom, the apparatus and accessories. The plaintiff company was a body incorporated for the installation of private telephones, and in 1910 it entered into agreements with the defendants to deal with the defendants' apparatus within a specified area for a period of 35 years, and to pay the defendants a royalty. In consequence of the war it was altogether impossible to carry out the contracts, and the plaintiff company asked for a declaration that the contracts had been determined by the war.

MR. FREDK. THOS. JACKSON, managing director of the plaintiff company, deposed that he had disclosed to the Public Trustee Mr. Fuld's interest in the company, and the amount due to the defendant company for instruments supplied. The plaintiff company had hired out a number of instruments, and, in order to keep them in working order, it was necessary to have spare parts. It was impossible to get these from Germany, and, therefore, in order to carry on their business, the plaintiff company must have power to enter into contracts with firms in England.

MR. JUSTICE BRAY: Is that one of the things that this agreement prohibits you from doing?

THE WITNESS: Yes.

MR. JUSTICE BRAY made the declarations asked for.

There was a second case, in which the I.T.C., Ltd., proceeded against the Telefon and Telegraphenbau Gesellschaft G.m.b.H. and Mr. Hugo Mayer, asking for declarations of a similar character. The case had relation to similar agreements, and in this instance it was intimated that the area covered by the agreement was London and practically the whole of the South of England.

His LORDSHIP made similar declarations.

A third case was brought by the New System Private Telephone Co., Ltd., against the Deutsch Privat Telefon Gesellschaft, and similar declarations were also made.

THE PRODUCTION OF CONSTANT HIGH POTENTIAL WITH MODERATE POWER OUTPUT.

AN article on the above subject, by Mr. A. W. HULL, appeared in a recent issue of the *General Electric Review*, of which the following is an abstract:—

Up to the present time only two methods have been available for the production of constant high potential, viz., the electrostatic induction machine, and the combination of a large number of low-voltage D.C. generators in series.

The electrostatic induction machine was invented simultaneously by Holtz and Toepler in 1865. Machines have been built, having 20 movable and 20 stationary disks, which can generate as much as 80 milliamperes. But surface leakage becomes so great at about 50,000 volts that it is usually impossible to exceed this voltage.

Some recent machines with special composition plates will give 4 milliamperes at voltages of nearly 100,000, and can deliver a little current even at 150,000 volts. The chief limitation of such machines, besides their small power, is that the voltage is not constant, but builds up indefinitely until limited by spark-over or brush discharge.

The combination of D.C. generators in series is used in a few power installations where long-distance or underground transmission is necessary, and its chief disadvantage is that the generators must be mounted on insulated beds and driven with insulating belts or shafts.

Recent developments in the field of electric conduction through vacuum, and especially the development and extensive use of high power X-ray tubes, have created a considerable demand for a source of power that will furnish from 1 to 50 kW. at voltages between 10,000 and 200,000. The apparatus to be described was not designed to meet this general demand, but as an accessory to a definite investigation on X-ray spectra. It has, however, proved so satisfactory as

to recommend itself for quite general use where constant high voltage of a few kilowatts' power is needed.

The method used was the rectification by kenotrons of high-tension alternating current, this rectified current being used to feed a high-voltage condenser of such capacity that

FIG. 1.

FIG. 2.

DIAGRAMS OF CONNECTIONS FOR THE PRODUCTION OF HIGH-VOLTAGE DIRECT CURRENT.

it can supply the desired current during the part of each cycle when it is receiving nothing without having its voltage drop more than a small specified amount. In the present case the capacity used was much smaller than that necessary to keep the voltage fluctuations within the desired range, and these fluctuations, which were about 25 per cent. for full load,

shown in fig. 1, without appreciably distorting the voltage wave, and it gives a very convenient means of voltage control, viz., by varying the capacity it is possible to vary the voltage over the entire range from 40,000 to 100,000 volts. This is the method of control used.

The kenotron has already been described in the ELECTRICAL REVIEW.* It consists of a hot-filament cathode and a metal anode, generally tungsten or molybdenum, which is so thoroughly freed from gas by intense heating during evacuation that no gas phenomena ever appear, even at 100,000 volts. Under these conditions the conductivity of the tube is entirely unidirectional, the current being carried only by the electrons emitted by the hot filament.

FIG. 5.—UPPER CURVE: A.C. VOLTAGE (Base Line B₁). LOWER CURVE: RECTIFIED CURRENT (Base Line B₂).

Figs. 3 and 4 show the types of kenotron, and fig. 5 shows the completeness of the rectification. On the positive half of the cycle the current and voltage follow the A.C. wave, the voltage drop in the kenotron being only 200 or 300 volts. On the negative half the current is zero, and the voltage drop in the kenotron is the full voltage of the A.C. wave.

It is evident from the manner of operation of the kenotron that it has two advantages over other types of high-voltage rectifier, which make it especially adapted to the production of constant potential:—

1. It allows current to flow in only one direction, whatever the voltage may be. Hence, if used to charge a condenser it will feed current into the condenser whenever the A.C. voltage is higher than that of the condenser, but will never take back anything it has given. A mechanical rectifier, on the other hand, is just as likely to discharge the condenser as to charge it, unless the timing is exactly right.

FIG. 3.

FIG. 4.

FIGS. 3 & 4.—STANDARD KENOTRONS FOR RECTIFYING 20,000-VOLT AND 100,000-VOLT ALTERNATING CURRENT.

were damped out by the use of another small condenser of the same size and a small choking coil. The arrangement is shown in fig. 1. Single-phase alternating current of 2,000 cycles at 150 volts is stepped up to the desired voltage by a transformer T, rectified by kenotrons K₁ and K₂ and smoothed out by the condensers C₁ and C₂ (0.001 microfarad capacity each) and inductance L₁ and L₂ (about 200 henrys each). The voltage is measured by an ordinary voltmeter V in series with a 10-megohm resistance.

By this means it was possible to supply 5 kw. at any voltage between 10,000 and 100,000 volts with a voltage fluctuation of less than 1 per cent. This output could, if desired, be more than quadrupled by the use of 4 kenotrons instead of 2, and still further increased by the use of three-phase alternating current.

The generator is of the "dynamotor" type, designed for a 10-kw. single-phase 2,000-cycle output, and operates on a 440-volt, three-phase, 60-cycle line. It can be built equally well to operate on any voltage, A.C. or D.C.

The transformer is built for 75 kv. R.M.S. It has an air gap in the magnetic circuit, and when untuned takes 75 amperes magnetising current. By the use of 50 microfarads capacity across the primary this is reduced to about 3 amperes.

This use of an open circuit transformer makes it possible to use only one-half of each wave, as in the arrangement

FIG. 6.—DIAGRAM SHOWING ARRANGEMENT OF CONDENSERS.

2. Being free from all lag, such as is inherent in a gas rectifier, and having no moving parts, it operates equally well at all frequencies. This is very important, as it allows the use of a high-frequency generator which greatly reduces the amount of capacity that has to be used. For example, in order to obtain from 60 cycles the same power with the same constancy as that given by the 2,000-cycle outfit, viz., 5 kw. with ½ per cent. fluctuation, it would be necessary to use a capacity of 0.35 microfarad, nearly 200 times the amount necessary for 2,000 cycles, and this would cost, at present prices, \$35,000.

Since no satisfactory high-voltage condensers are on the market, it was necessary to use a number of low-voltage condensers in series. When series condensers are used on A.C. there is no tendency for the voltage to become unequally divided between them. With D.C., on the other hand, unless the leakage over each condenser is exactly the same, the tendency would be for the voltage to become more and more unequally divided between the condensers until, finally, one would break down, the process being repeated until all broke down.

To avoid this, each condenser was provided with a corona gap, such that leakage over it would be larger compared with

* "The Kenotron Rectifier"; *Elec. Rev.*, May 7th, 1915, p. 644.

all other leakage at the rated voltage. The arrangement is shown in fig. 6. The condensers are of paraffin paper, rated at 10,000 volts each, ten in series. The gaps are standard sewing needles spaced $\frac{1}{2}$ in. between points, and in order to prevent injury to the gaps in case of spark over, each gap is provided with a small resistance R in series with it. The best evidence of the effectiveness of this arrangement is that it has been in operation eight hours a day for eight months, often at 10 per cent. above rated voltage, without an accident. At 110,000 volts, i.e., 11,000 across each condenser, spark over across the gaps occurs quite frequently, but is mild and harmless. At 100,000 volts, for which the gaps are set, it does not occur.

As regards inductance, the high-tension winding of a 5,000 110-volt, 200-watt instrument transformer has proved quite satisfactory as a high impedance. It is difficult to calculate or to measure the effective impedance for a given frequency under operating conditions, because the actual current is an A.C. or, rather, a series of A.C. components, superimposed upon a D.C., and the effective permeability of the iron depends very much upon the degree of its saturation by the D.C. component. The best measurements obtainable indi-

FIG. 7.—FULL LINE: 2,000-CYCLE A.C. VOLTAGE. DOTTED LINE: RECTIFIED VOLTAGE AT TERMINALS OF CONDENSER C_1 (fig. 1).

cate that the inductance varies from 1,000 to 200 henrys. The 10-megohm resistance consists of 1,000 voltmeter spools, 10,000 ohms each, in series. They are mounted 1 in. apart on lattices of $\frac{1}{2}$ in. by $\frac{1}{2}$ in. hard wood, 100 to each lattice, and the lattices are spaced 3 in. apart vertically above each other. The whole unit is immersed in oil, but this would not be necessary where more space is available.

The kenotron is a device of low resistance, 1,000 ohms, for current in one direction and infinite resistance for current in the other direction, and is entirely free from the lag and "breakdown" necessary to the starting of gas rectifiers.

The condenser C is a simple electric reservoir which absorbs energy from the transformer, through the kenotrons, during a small part of each cycle, and delivers it to the circuit at a nearly constant rate during the remainder. Its operation can best be understood from fig. 7, where the full curve represents the voltage at the transformer terminals, and the dotted curve that at the terminals of C_1 . At the point A , on the peak of the A.C. wave, the condenser is charged to the full potential of the transformer. From this time on, for nearly a whole cycle, it receives nothing from the transformer, and its poten-

tial and C_2 respectively comes out to be $1/256$; it is evident that the higher harmonics need not be considered at all.

A word should be said about the effect of inductance without capacity in the position C_2 . It is often carelessly assumed that inductance in a line will of itself absorb current fluctuations. It is evident from the above reasoning that this is true only when the load itself has a low impedance. For small loads this is by no means the case, and for an X-ray tube of the Coolidge type, in which the current is constant and independent of voltage, the impedance is infinite for all loads and all frequencies. Hence, in this case, the use of inductances L_1 and L_2 without capacity, or some other low impedance, in the position C_2 would be entirely ineffectual.

The actual capacity used was $C_1 = C_2 = 0.001$, nearly twice the amount necessary to reduce the fluctuations to 1 per cent., and the oscillograms show that the fluctuations were actually about $\frac{1}{2}$ per cent.

If 60-cycle current were used instead of 2,000-cycle, the capacity necessary to keep the fluctuations to $\frac{1}{2}$ per cent. would be, $C = 0.35$ microfarad; $C_1 = 0.19$ microfarad; $C_2 = 0.16$ microfarad.

The constancy of the voltage obtained under different conditions is shown by the oscillograms, which were taken with a water resistance load in series with the oscillograph coil across the line, the end of the line adjacent to the oscillograph being earthed. For voltages above 50,000, where the end of the line could not be earthed, two water tubes of nearly equal resistance were used and the middle point between them was grounded. Oscillograms were then taken on both sides of the ground, in order to detect any asymmetry in the form of a current to earth.

Fig. 8 shows the voltage obtained with the apparatus arranged as in fig. 1, with a load of 50 milliamperes at 50,000 volts. The fluctuations scarcely show in the reproduction, but on the negative they measure about $\frac{1}{2}$ per cent. Fig. 9 shows the results of using the two kenotrons in parallel, as in fig. 2, thus rectifying both half waves of each cycle. The base line for the D.C. potential was made coincident with that of the primary wave. The film was run at high speed so as to resolve the 4,000-cycle or higher frequency fluctuations if any were present, but no fluctuations whatever can be seen, even on the original negative. This increased smoothness produced by rectifying both halves of the cycle, which means doubling the frequency of the lowest A.C. component, was anticipated.

In the oscillograms the primary A.C. wave shows no trace of distortion, even at maximum load, which is a strong advantage of the open magnetic circuit type of transformer.

By the use of three-phase 2,000-cycle current and six kenotrons it would be possible with present apparatus to furnish 100 kw. at 100 kv. with the same constancy as that of the 5-kw. installation described above, and there is every reason to believe that this can be increased to 1,000 kw. in the near future.

WAR ITEMS.

Lighting Prosecutions.—Mr. S. Pauls, the borough electrical engineer of Middleton (Lancs.), was summoned at the local police court last week for a breach of the lighting restriction regulations. It was stated that shortly after 10 p.m. on March 6th, a constable saw light coming from the electricity works right into the roadway. On proceeding inside the works he saw nine electric lights on at full. There was some brown paper on them, but they were not effectively shaded. When the attention of the defendant was drawn to the matter, he told the officer that they had done their best, and that they had expected blinds for the windows that day, but had been unable to get them. A fine of 7s. was imposed.

At Eccles last week, Ebenezer Beal, electrician, of Wellington Road, was summoned for a breach of the lighting restriction order. He stated that the only light in his shop was in the centre, and after an early warning had been given by the police another constable had told him it was now all right. He complained that he need not have been brought before the court if the present officer had informed him that further reduction of the intensity or reflection was necessary. A fine of 5s. 6d. was imposed.

The "City Press" states that, at the Mansion House, for contravening the Lighting Order by means of a business advertisement lighted by electricity, Charles Brownhill, 84, St. Paul's Churchyard, was fined 40s.

Companies to be Wound Up.—Further companies which are to be wound up under orders of the Board of Trade include the following:—

United Berlin and Frankfort India-Rubber Co., Ltd., 11a, Upper Thames Street, London, E.C., manufacturers of india-rubber goods, etc. Controller: P. D. Leake, 25, Abchurch Lane, London, E.C.

Ship Carbons, Ltd., 5, Chancery Lane, London, E.C., dealers in carbons for electric lamps. Controller: William Hancock, 90-91, Queen Street, London, E.C.

Schoen Bros., 29-30, Cock Lane, Snow Hill, London, E.C., agents for the supply of electrical goods. Controller: J. W. Barratt, 19a, Coleman Street, London, E.C.

Fischer Ball and Bearings Co., Carlton House, High Street, Birmingham, manufacturers of ball bearings. Controller: H. Heaton, 95, Colmore Row, Birmingham.

FIG. 8.—UPPER CURVE: CONSTANT POTENTIAL 50,000 VOLTS AT TERMINALS OF C_2 (Base Line B_1). LOWER CURVE: 2,000-CYCLE PRIMARY VOLTAGE (Base Line B_2).

FIG. 9.—UPPER CURVE: CONSTANT POTENTIAL 50,000 VOLTS (Base Line B_1). LOWER CURVE: 2,000-CYCLE PRIMARY VOLTAGE (Base Line B_2).

tial therefore falls at a given rate. At the point B the transformer voltage becomes higher than that of C_1 , and current again begins to flow through the kenotrons into C_1 , charging it to the potential of the transformer at the point C , where the process of discharge begins anew. In practical cases the current is nearly constant.

In a given case, if the total voltage is 100,000, in order to reduce the fluctuation to 1 per cent., or 1,000 volts, one would have to use 0.025 microfarad capacity, if the inductances L_1 and L_2 (fig. 1) were omitted. The actual value $C_1 + C_2$ that is needed with the inductance is only 0.002 microfarad, which means a very great saving of expense, and demonstrates the value of using inductance.

The maximum amplitude of the voltage fluctuation across C_1 is 25 per cent. at 100,000 volts and 50 milliamperes, and if we take this as the amplitude of the 2,000-cycle component, then the amplitude of this component at the terminals of C_2 would be $1/64$ of 25 per cent., or less than $\frac{1}{2}$ per cent.

In like manner, the ratio of the amplitude of the second harmonic, the 4,000-cycle component at the terminals of C_1

Exemption Applications.—At the Southwark Tribunal, on Monday, Messrs. Burdette & Co., electrical and mechanical engineers, applied for the absolute exemption of three electrical improvers. The men had already been given ten groups. Mr. Ferne, on behalf of the applicants, pointed out that the Minister of Munitions had stated that men in this trade should be kept in the country. The men were all skilled or semi-skilled in electrical fitter's work. The applications were refused.

The Southport Tribunal, on March 24th, refused an appeal by the Southport Tramways Co. on behalf of a tram driver. It was urged that his was a certified occupation, and that conditional exemption had already been granted to a driver who had since joined the Royal Engineers.

At the Sheppey Rural Tribunal, Mr. W. E. Charlton, manager of the Sheerness and District Electric Power and Traction Co., applied for exemption for one inspector and three motor-bus drivers. Short terms of exemption were given to two drivers, but it was decided to take no action with regard to the inspector and one of the married drivers, as the groups to which they belong have not yet been called up.

At the Hastings Tribunal an electrical and mechanical engineer claimed on the ground that he was in a starved trade. The application was refused, it being remarked that he must have been starved under a misconception.

At the Chester-le-Street Tribunal an electrical engineer, of Birtley, applied for exemption on the ground that he was in a certified occupation and that he was carrying out a contract at munition works. At the beginning of the war he had five men, but now only had a lad. Temporary exemption to April 30th was granted.

At the Sunderland Tribunal a man, aged 19, asked for temporary exemption to enable him to pass his final examination three months' hence as a wireless telegraphist. The case was adjourned for a week, so that it could be ascertained what instructions had been issued by the Government in regard to students of wireless telegraphy.

At the Gloucester Tribunal Mr. Corson supported claims for the exemption of four electrical workers employed by the Corporation. One of the claimants was exempt by reason of his occupation, another was considered to be indispensable and was given until September 30th. Of the other two, one, a storekeeper, was given until September 30th, and the other, a motorman, was given until April 15th.

At the Islington Tribunal a twenty-year-old student of electrical engineering, studying at a college in Kensington, asked for exemption. It was suggested that a young man with the applicant's knowledge should place his services at the disposal of the country, as other students had done. The application was refused, and the young man then said that he desired, under those circumstances, to be trained as an officer of the Royal Engineers.

Before the Dover Tribunal the Deputy Borough Engineer applied for W. J. Marley, a driver of one of the electrical scavenging vehicles. He was 20 years of age. Six months' exemption was allowed.

At the Barrow Tribunal William Drysdale, electrical engineer, made an application in respect of an electrical wireman. The employer stated that he had lost 17 men since war broke out, and if this one were taken, he would have to close his establishment. He was engaged on Government work. Temporary exemption was granted until July 1st.

At the Bexley Heath Tribunal Gilbert North, electrical and mechanical engineer, managing director of the Dickinson Electrical Manufacturing Co., and foreman mechanic applied for total exemption. Exemption was granted conditional on applicant continuing to act as foreman mechanic.

Electrical Wages at the Pulitoff Works.—In regard to the suspension of work at the Pulitoff works which, according to Reuter, was discussed by the "Duma" with closed doors, the Minister of War is reported as stating that on February 7th the men in the electrotechnical workshops demanded 70 per cent. increase in wages. This was refused as exorbitant, and a strike having broken out, the military authorities closed the works, but having come to an understanding with the electricians, they posted notices saying that men would again be taken on. Work was then resumed. Later, trouble occurred in other departments, and the works were closed on March 7th and placed under the Ministry of War, since when they have been idle.

Trading with the Enemy.—In the "London Gazette," for March 24th, there appear amended lists of persons and bodies of persons in the following countries with whom or which trading is prohibited. Many additional names are given, including a number of electrical firms:—Argentina and Uruguay, Brazil, Ecuador, Peru, all countries in Central and South America, Netherlands, East Indies, Philippine Islands, Portugal, and Spain. These lists are sent to H.M. representatives in the several countries, and they will notify British Consular officers, to whom persons abroad may apply for information as to the names on the list.

Use of Electric Torches Forbidden.—Intimation has been given by the Beverley authorities that the indiscriminate sale of electric torches and flash lamps is now forbidden, and that no person may use them in the streets or open country between sunset and sunrise. The penalty for infringement of these restrictions is six months' imprisonment or a fine of £100.

After-the-War Trade.—At the annual meeting of the Birmingham Chamber of Commerce, to be held yesterday, the following resolution was to be proposed by the Mayor:—"That this general meeting of the Birmingham Chamber of Commerce strongly urges upon his Majesty's Government the necessity for their taking, in conjunction with the Governments of his Majesty's Dominions, definite and immediate steps for the purpose of fostering and safeguarding the commerce and industries and the natural and material resources of the Empire, and preventing any possibility of a return to pre-war conditions."

It is now announced that M. Bonar Law will attend the Allied Economic Conference as well as Mr. Runciman.

A Coming Problem.—A matter of some interest to municipal bodies, who decided to keep open the situations of employees who enlisted, was raised at a meeting of the Burv Tramways Committee last week. The tramways manager reported that men formerly employed in the tramways department were now being discharged from the Army, and some of them had been rendered unfit for their old duties. He was unable to find sufficient light work for those discharged, and asked for instructions on the matter. The question was remitted to the General Purposes Committee for consideration.

Haslingden and its Contractors.—When a resolution was introduced, at Haslingden Town Council, on March 23rd, asking that body to join in a resolution not to trade with enemy firms, Councillor Waddington said the Council had business with a well-known electrical firm whose capital was largely German at present. Under the new Act they had the privilege of clearing out the German element, however, and if they did that it would become purely an English firm, British controlled. If those steps were not taken, Haslingden Council ought to finish trading with them.

Tramways and Ministry of Munitions.—In response to the application of the Bolton Tramways Committee, the Ministry of Munitions has issued a certificate, declaring that the supply of tramway facilities is of importance for the purpose of carrying on munitions work. This means that the department and its employees are subject to the provisions of the Munitions of War Acts in regard to leaving work and strikes. A similar certificate has been issued to the South Lancashire Tramways Co.

After-the-War Electrical Manufacturing in Russia.—The A.E.G. works of Riga have been removed to Karkoff. Work has already been begun there in rented premises, where about 2,000 men are employed, all from Riga. When in full work the number will be raised to 4,500. The company is planning to introduce, after the war, the production on a large scale of small electrotechnical equipment, such as before the war came from abroad, chiefly Germany.

Exports to China.—The "London Gazette" (March 24th) contains a further list of persons and bodies to whom exports to China may be consigned.

Controlled Establishments.—The number of controlled establishments has been increased to 3,337.

BUSINESS NOTES.

Catalogues and Lists.—PRITCHETT & GOLD AND ELECTRICAL POWER STORAGE CO., LTD., 32, Victoria Street, London, S.W.—An expanding binder has been prepared containing a number of recently issued pamphlets giving full information respecting the company's storage batteries for lighting and power. B10 deals with the use of storage batteries in central stations and factories; B11 gives notes on the capacity and efficiency of storage batteries; B12 gives a specification of cells, stands and fittings for batteries for lighting and power installations; B13 is devoted to accumulator accessories; B14 relates to accumulators in glass boxes; and B15 to accumulators in wood boxes. Copies of these publications can be obtained on application.

MESSRS. POOLEY & AUSTIN, Westminster, S.W.—Folder giving particulars of "Panda" electric pumping plant.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—Price list No. 5,313, of eight pages, giving in their usual form illustrated particulars, dimensions, and prices of automatic control for electric capstans and winches.

A French Amalgamation.—It is stated that the Société des Tréfileries du Havre has decided to amalgamate with the Société Electro-Métallurgique de Froges. The effect of the combination will be to permit the former to obtain more easily the supplies of aluminium which are needed, and of which the latter is a large producer, whilst at the same time the electro-metallurgical company will be able to utilise its power resources to a greater extent. The capital of the Havre company is to be increased.

Monometer Furnaces.—THE MONOMETER MANUFACTURING CO., LTD., of Birmingham, are supplying their Monometer patent furnaces, melting furnaces, and hardening furnaces and heat controllers for a large number of important factories in the Provinces and in London that are engaged in the melting, &c., of lead, Admiralty metal, aluminium, tin, zinc, &c.

Cape Asbestos.—THE CAPE ASBESTOS CO., LTD., whose factory, employing about 250 hands, is situated at Barking, Essex, has been working day and night for some months past. The company, besides owning large Blue Asbestos mines in South Africa, possesses factories also in France and Italy, and thus forms a link in the commercial "entente" between the three countries. We are informed that 90 per cent. of the shares are under British control, and Lady Wernher, one of the principal shareholders, has demonstrated her loyalty to this country by subscribing for approximately £1,000,000 War Loan Stock.

Electrical Trade at Johannesburg.—The Imperial Trade correspondent at Johannesburg reports that electrical materials are being purchased as fast as they are being received in Johannesburg.

Concerning Discounts.—The references to this subject which have been appearing in our "Correspondence" columns have attracted the attention of sales departments, with beneficial effects. We have received from Messrs. W. T. Henley's Telegraph Works Co., Ltd., a booklet which is described as their answer to the discussion—we will not call it the indictment. The booklet contains, in convenient form, particulars of conductors as adopted by the Engineering Standards Committee (V.R. insulation), and net prices for taped and braided wires and cables and the Henley wiring system, per mile and per yard, without any discounts, though the successive discounts on which the net prices are based are given in a footnote. Here is an excellent example, only slightly marred by an intimation that all prices are subject to a certain slight advance; we commend it to the trade in general.

Bankruptcy Proceedings.—W. D. BIRKETT, factor of electrical goods, of Arnside, Windsor Avenue, Whitley Bay, Northumberland.—At Newcastle-on-Tyne Bankruptcy Court, on March 23rd, this bankrupt came up for examination. The statement of affairs showed liabilities expected to rank amounting to £294 and a deficiency of £175. In reply to the Official Receiver (Mr. Chas. Woollett), the debtor stated that he was engaged as a commercial traveller for about three years prior to June, 1915, when he commenced business as a factor of electrical goods under the style of the Northern Wholesale Electrical Supply Co., in Whitley Bay, with capital amounting to £6. He had also £20, which he borrowed from his wife and repaid to her. He denied that he had represented to any one that he had capital amounting to £250. Keen competition, and being unable to obtain goods owing to the war, were the causes of his failure. The hearing was adjourned.

Book Notices.—"Science Abstracts." Vol. XIX, Part 3. March 25th, 1916, Sections A and B. London: E. and F. N. Spon, Ltd. Price 1s. 6d. each.
"British Destiny." By Mr. D. N. Dunlop. London: The Path Publishing Co. Price 3s. 6d. net.

Dissolutions and Liquidations.—MESSRS. J. W. WILLOUGHBY & E. WILCOX, electrical engineers, of 44A, Trafford Road, Salford.—Messrs. J. W. Willoughby and E. Wilcox have dissolved partnership. All debts, &c., respecting the electrical business will be attended to by Mr. Wilcox, who is continuing in business as Edward Wilcox & Co., electrical and mechanical engineers and contractors, at Central Buildings, Trafford Road, Salford.

PARANA POWER SYNDICATE, LTD.—A meeting is to be held on May 3rd, at 1, Cornhill, E.C., to hear an account of the winding up from the liquidator, Mr. L. Maltby.

MESSRS. ALFRED GRAHAM & CO., ST. Andrew's Works, Crofton Park, and Kilmorie Works, Forest Hill, London, electrical engineers.—Messrs. A. Graham, J. A. L. Dearlove, and E. A. Graham have dissolved partnership. The Messrs. Graham will attend to debts, &c., and continue the business under the same title.

ADNIF ELECTRIC CO., LTD.—The report of the Official Receiver in this matter has been issued to the creditors and shareholders, and will be referred to in our next issue.

Trade Announcements.—THE ELECTRICAL ENGINEERING AND EQUIPMENT CO., LTD., of New Oxford Street, W.C., announce that their stores will be closed for stocktaking from April 1st to 7th.

THE KIRKLEY GAS AND OIL ENGINE CO., LTD., have removed to Imperial House, Kingsway, London, W.C.

We are informed that on the 22nd inst. Mr. Handel Booth, M.P., took over the sole management of Messrs. W. B. Haigh, Gruban & Co., Ltd., of Oldham. Mr. J. Gruban placed his resignation in the hands of the directors, and ceased all connection with the company.

For Sale.—As announced in our advertisement pages to-day, Messrs. Fuller, Horey, Sons & Cassell are offering for sale by tender, in one lot, the assets of the Float Electric Co., Ltd.

LIGHTING AND POWER NOTES.

Aberdeen.—The Electricity Committee reports that the number of units generated during February amounted to 1,373,750, an increase of 255,130 units over the amount generated for February last year. The increase was the largest for any month during the last 2½ years.

The Committee has decided to meet the directors of the Great North of Scotland and the Caledonian Railways in connection with the charge for the supply of electricity.

Abertillery.—PRICE INCREASE.—The District Council has decided to increase the price of electricity by 4d. per unit. It was reported that there would be a deficit of £2,303 on the electricity undertaking for the year.

Australia.—The carrying out of the Wollongong (N.S.W.) electric lighting scheme has been deferred; the average price tendered amounted to nearly £9,000, which was about £3,000 in excess of the consulting engineer's estimate. A modified scheme has now been suggested, and the matter has been referred back to the Lighting Committee for further report.

The inauguration of the electric lighting scheme for the municipality of Coonamble took place recently. The installation will provide 9,750 C.P., at an annual cost of £442. The cost of the installation is estimated at between £7,000 and £8,000.

The formal inauguration of the Doncaster (Vic.) electric lighting scheme took place last month. The scheme has been installed at a cost of £1,750, and an extension is now being carried out to Doncaster East, at an estimated cost of £1,000. The local Council has been guaranteed against loss on the scheme for a period of five years by a Committee of ratepayers. About 60 houses have already been connected with the mains, and others are wired in readiness for connection.—*Melbourne Age.*

The electric lighting scheme for the Blue Mountains (N.S.W.) towns of Lawson, Wentworth Falls, and Springwood has been deferred pending the passing of the new Local Government Bill and the conclusion of the war.

The Melbourne City Council has been notified that the 5,500-kw. turbo-generator on order from the British Westinghouse Co. has been requisitioned by the British Government; as the growth of the demand next winter is likely to be less than originally estimated, the Electric Supply Committee does not anticipate that the non-delivery will cause any serious difficulty.—*Tenders.*

Aylesbury.—PRICE INCREASE.—The U.D.C. has increased the price of current for lighting by 10 per cent., and for power by 4d. per unit.

Birmingham.—The Electric Supply Committee has had under consideration the operation of the coal clause in agreements with H.T. consumers. Messrs. Cadbury have intimated that although their agreement does not include the coal clause, they are willing to pay for current at the rates in force under the new agreements, and the Committee hopes the example will be followed by other H.T. consumers. As regards the effect of the shortage in coal supply, the Committee has been able to maintain the output, and is hopeful that, with the advance of spring, its difficulties will be overcome.—*Birmingham Daily Post.*

Bispham.—STREET LIGHTING.—Instead of paying the Electricity Committee £400 per annum for current for street lighting purposes, the Highways Committee has decided to pay for current for public lighting, at the rate of 2½d. per unit. It was stated that there had been little public lighting for the last two years, and the fresh arrangement was much more satisfactory than the old one.

Blackpool.—Despite lighting restrictions, the supply of electricity for private lighting during February increased by 11,736 units, which was practically counteracted by a drop of 11,408 units for public lighting. However, increased traction supply amounted to 28,432 units. For the last 11 months there has been a decrease of 293,658 units sold, as compared with the same period of 1914-15.

Bon'ness.—Plans of a proposed addition to the generating station at the distillery of James Calder & Co., Ltd., have been approved by the Dean of Guild Court. The addition is estimated to cost £6,000.

Canada.—The new Hydro-Electric Commission has been appointed for the city of Ottawa, in terms of the new Act passed at the last session of the Ontario legislature. It consists of James A. Ellis, appointed by the city, with the Mayor *ex officio*, and an appointee of the Ontario Hydro-Electric Commission.

The big wheat crop in the West and the splendid prices received, and the possibilities of a bigger crop and even better prices this year, is begueting confidence, so much so, that many of the Western towns which have allowed public utilities to remain in *status quo* in the last three years, are taking steps this season, to extend and improve the various municipal electrical plants.

Chatham.—PRICE INCREASE.—The Kent Electric Power Co. has further advanced the price of energy by 1½ per cent., as from April 1st. Reduced rates for special supplies and discounts have been withdrawn, and a revised scale of charges has been fixed for apparatus on hire.

Chelmsford.—E.L. CHARGES.—The Electric Supply Corporation has informed consumers of electricity that, from the end of the March quarter, a minimum charge will be made for electricity of 8s. 1½d. per quarter for any quantity up to 15 units (for cash payments this will be reduced to 7s. 6d.). After the first 15 units the charge will be 6½d. per unit, less 4d. cash discount.

Chile.—Permission has been granted to the Chile Exploration Co. (a United States syndicate) to install a 5,000-volt overhead transmission line from Chuquicasta to El Banco, and to the San Salvador station of the Antofagasta-Bolivia Railway, covering a distance of about 5½ miles.—*Board of Trade Gazette.*

Crayford.—STREET LIGHTING.—The P.C. has approved a draft agreement with the West Kent Electric Co. for public lighting at the new estates opened out in the parish.

Clifden (Co. Galway).—At a recent meeting of the District Council it was stated that £300 expenses had already been incurred in connection with the electric lighting scheme for the town, and the Clerk was instructed to furnish details to the L.G.B., as requested by it.

Continental.—**SWITZERLAND.**—The distinction of utilising the highest fall of water (1,640 metres) in a hydroelectric works in Switzerland now belongs to the Usine de Fully, recently completed; the highest previous cases were the plant at Orli, in the Eastern Pyrenees, with a fall of 925 metres, and the Vouvry Usine in Canton Valais, 917 metres. The installation has been carried out by the Société d'Electrochimie, of Paris, from the plans of M. A. Boucher, to whom was due the design of the other two works. The plant includes 3,000-H.P. turbines built by Messrs. Picard-Pictet, the high-pressure pipes feeding the turbines having a total length of 4,625 metres.

Dartford.—**PRICE INCREASE.**—The U.D.C. has decided to increase the charges for current as from April 1st, by 20 per cent.

Darlington.—**YEAR'S WORKING.**—The Electricity and Light Railways Committee recently reported an increase of £2,300 in the revenue of the electricity undertaking. Revenue from the supply of electricity for lighting was almost the same as in the preceding year, but there was an increase of £3,000 in the amount received for the supply of power. The increased cost of fuel and the increase in rates and working expenses generally amounted to about £1,000, and the profits are about £2,000 less than anticipated. It was decided that the available profits should be placed to a reserve fund. Last year £3,000 was transferred from the electricity undertaking for rate relief.

Dumfries.—The Sanguhar and Kirkconnel Collieries, Ltd., are extending their operations, and constructing a haulage road and new screening plant, both of which are to be electrically operated.

Dundee.—**GAS WORKS POWER PLANT.**—The gas manager recently reported to his Committee that the cost of running the electric plant at the gas works entirely by their own generating plant for 12 months would amount to £152; as compared with this, the cost for running with the public electric supply, allowing for a weekly run of the gas works plant as stand-by, amounts to £78 per annum.

Edinburgh.—**PLANT EXTENSION.**—The T.C. has adopted the recommendation of the Electric Lighting Committee for additional expenditure on the McDonald Road station, amounting to £11,000. The Council has agreed to the acceptance of estimates for the building and steelwork of the new generating station at Portobello, amounting to £30,570.

Halifax.—**RATE RELIEF.**—The chairman of the Finance Committee, in moving the adoption of the estimates for the next 12 months, and the levying of a total rate of 10s. 4d. in the £, stated that the profit from the Corporation electricity works was £14,355, and from the tramways £14,014, which, with the profit from the gas department, represented 9.03 per cent. on the gross capital expenditure.

Haslingden.—**BULK SUPPLY.**—The Council has been informed that the Accrington Corporation, which is under agreement to supply the Council with electricity in bulk, has now agreed to Haslingden obtaining a supplementary supply from the Rawtenstall Corporation. Terms have been arranged which will be no higher than those charged by Accrington.

High Wycombe.—**STREET LIGHTING.**—With reference to the dispute regarding the public lighting contract between the U.D.C. and the Electricity Co., the former body has decided to let the matter stand over pending the result of the appeal in the case of the Leiston Gas Co. and the Leiston U.D.C., it being made clear that the Council will not be bound by the result. The company had asked for payment of £100 per quarter for standing charges, 15s. per lamp per quarter for lamps used, and the existing contract to be extended for the period of restricted lighting.

Ipswich.—**NEW PLANT.**—The T.C. has adopted the recommendation of the Electricity Committee to install an induced draught fan in connection with the boiler plant at the electricity works, at a cost of £850.

Itchen.—**PROV. ORDER.**—The Council has decided to apply to the Board of Trade for an extension of the period for the electric lighting order, until three years after the termination of the war.

Leyton.—**PRICE INCREASE.**—The Electricity Committee recommends that the charges for electricity be increased as follows:—An addition of 1s. per cent. upon the amount of each quarterly account for private lighting, power and heat; an addition of 5 per cent. upon the amount for public lighting and 5 per cent. upon the amount for current supplied to the tramways. The Committee pointed out that of the total of 3,400 consumers, there were 2,320 quarterly accounts, the annual income from which was under £5 each; if the average were taken at £2 10s., the 15 per cent. increase would only represent the meter rent, which was abolished in 1910.

London.—**WOOLWICH.**—The Finance Committee of the B.C. disapproves with the suggestion of the Treasury that the expenditure of £3,290 to cover capital expenditure on mains, trans-

formers, &c., should be met from the rates, having regard to the heavy charges which have already fallen on the rates in connection with the undertaking. Application is to be made to the L.C.C. for sanction to borrow £24,785 for a 3,750-kw. turbo-alternator with boiler, switchgear and accessories; £2,330 for transformer plant, switchgear, &c., and £385 for mains.

Ripon.—**E.L. SCHEMES.**—The Northern Counties Electricity Supply Co. has informed the T.C. that it cannot, under present circumstances, consider the establishment of an E.L. scheme for Ripon; the Harrogate Corporation has replied to the same effect. The Electricity Committee, therefore, considers that no useful purpose can be served by extending negotiations for the present.

Southampton.—**PRICE INCREASE.**—The Electricity Committee recommends the Corporation to increase the charges for lighting, power and heat by 10 per cent. from Midsummer next, and that the increased charges in respect of the tramways commence as from April 1st.

Stratford-on-Avon.—**ELECTRICITY PRICES.**—The Electricity Co. has approached the T.C. for permission to increase the charges for lighting from 5d. to 6d. per unit, and the matter has been referred to a Special Committee for report.

Tasmania.—**MR. C. T. Milne, H.M. Trade Commissioner** for Australia, reports that while in Tasmania at the end of last year he had an interview with the general manager of the Tasmanian Government hydro-electric department with reference to the scheme which is now in process of realisation. This scheme has in view the utilisation of water power derived from the Great Lake and its conversion into electrical power for distribution at Hobart and throughout the Island. It is expected that at least 26,000 actual H.P. at the turbine shafts could be generated for 12 hours per day or 39,000 actual H.P. for eight hours per day, and it is believed that this can be increased eventually to 70,000 H.P.

Owing to the difficulty in obtaining delivery of certain parts of the machinery, the completion of the installation (which has cost about £350,000) has been delayed, but the general manager stated that he fully expected that the work would be completed this month (March) or early in April.

West Ham.—The Corporation has been recommended to apply for sanction to the borrowing of the following amounts for electricity purposes:—Mains, £3,000; transformers, £5,000; cables, &c., £11,000; linking up connections, £4,500; generating station, £3,275. It is proposed to defray the item of £1,000 for electricity meters direct out of revenue. The Corporation is also recommended to adopt a coal clause in connection with the supply of current to the tramways department, the rate of payment for which was fixed in 1913, when the price of coal was 11s. 6d. per ton, at 75d. per unit. The clause will operate as and from November 1st last. In view of the results of the working of the undertaking for the nine months ending December 31st last, the borough treasurer reports that he has agreed with the engineer (for the purposes of fixing the district rate) a figure of £16,000 as the estimated deficiency for the year, in addition to a further £4,300 for the allowances to men on active service.

TRAMWAY and RAILWAY NOTES.

Australia.—The Victorian Railways Department has appointed an "Economy Board," and in several directions there is to be a heavy curtailment of expenditure. The electrification scheme is to be restricted, and various other works are to be held over.

Blackpool.—**TRAFFIC RETURNS.**—From April 1st of last year to March 16th of this year the tramway receipts have amounted to £77,506, an increase of £3,253, by comparison with the similar period of the previous financial year.

The Tramways Committee has had under consideration the question of renewing the lease of Dickson Road tramway to the Blackpool and Fleetwood Tramroad Co., and also the lease to Blackpool and Lytham Tramways Committee. There was a feeling in favour of the Corporation working all these sections within the borough. When the present leases expire, two or three years hence, the probabilities are that the Corporation will introduce a service of through cars, though it does not follow that outside tramway undertakings will be prohibited from entering the borough.

Continental.—**RUSSIA.**—**ELECTRIC RAILWAY SCHEMES.**

—Two electric railways were approved in 1914 by the Russian Government—namely, the Petrograd Northern Electric Railways Co., promoted by O. N. Herding, and the Petrograd Electric Auxiliary Lines, promoted by F. A. Lipsey. Permission to form companies was granted on condition that at least 50 per cent. of the share capital should be paid up not later than a year thereafter, but, owing to the war, this condition could not be fulfilled, consequently the promoters have approached the Government, asking for an extension of time. The Minister of Finance and the Minister of Communication have signified their willingness to grant this, and the condition is to take effect one year after the ratification of peace between Russia and her present enemies. The approved extension now goes before the second department of the Imperial Council for confirmation.

Darlington.—**YEAR'S WORKING.**—The Corporation tramways show an increase of revenue of about £1,000, but the working expenses have increased by £500, and special items account for another £500. The deficiency on the year's working is £1,000, as compared with £1,900 in the previous year.

London.—The L.C.C. has applied to the B. of T. to extend the time for the construction of the junction line to connect the existing tramways in Mitcham Road with those in Southcroft Road.

A tramway accident, which was fortunately unattended by serious results, occurred on the Southern L.C.C. tramways on Monday, when a car ascending Dog Kennel Hill, East Dulwich, for some reason ran backwards, leaving the track at the bottom, and after passing through a fence came to a stand in an adjoining field. No glass was broken, though the front of the car was damaged.

Stanley.—**DELAYED TRAMWAY EXTENSIONS.**—The U.D.C. has decided to lodge an objection with the B. of T. against the application of the Yorkshire (West Riding) Electric Tramways for an extension of the period to March 19th, 1918, for the completion of the lines as yet unconstructed, viz., Wakefield to Alverthorpe, a portion of line from Rothwell to Oulton, and a portion of the Ardsley line.

West Ham.—It is proposed to defray the cost of doubling the Connaught Road terminus track (£970), and making good the carriageway of Becketon Road (£350), out of revenue.

TELEGRAPH and TELEPHONE NOTES.

Atlantic Cables. The French Ministry of Posts has denied a German report that seven of the trans-Atlantic cables had been destroyed, and that only two remained serviceable. The situation, it is declared, is normal, and communication between the countries of the Allies and North America is being kept up regularly by 16 cables, not nine.

Canada.—Telephone communication has been opened by the Bell Telephone Co. between Montreal and Vancouver, a distance of 1,227 miles, by way of the United States lines.—*T. and T. Age.*

Italy.—In the seven years from 1907 to 1913 the Italian State Telephone Administration has spent 23,000,000 lire on the State telephone system. Of this sum, 13,600,000 lire stands for imports from abroad. In another seven years, says *L'Elettrotecnico*, a sum of 90,000,000 lire will be expended on like objects, under the powers conferred by the Calissano Law. British and French manufacturers will have the opportunity to secure a share in such future orders for material as the Italian Government may be compelled to place abroad.

New Zealand.—According to an American Consular report, during 1914 12 new telephone exchanges were opened by the Government in New Zealand, and the number of exchange connections increased by 4,816. A length of 2,136 miles of wire was added to the telegraph and interurban telephone system, and 34,325 miles of wire to the telephone exchange local system. The telephone service in Auckland is rapidly being changed to the automatic system, the instruments for which are coming from the U.S.A.

Storm Interruptions.—The stormy weather of the past week played havoc with the overhead telegraph and telephone lines of the whole country, and the underground lines proved invaluable, preventing the isolation of many towns. The worst effects were experienced in the Midlands and West of England, the interruptions to communication being the worst for 30 years. The telegraph lines along all the great railway systems suffered very severely, and many trains were delayed for several hours owing to the disorganisation of the signalling service. The damage was due to the accumulation of snow on the wires and the prevalence of exceptionally high winds.

Telegrams to the Forces.—The Postmaster-General announces the provision of special facilities for week-end letter telegrams to members of the British Forces in places abroad other than France and Belgium.

United States.—The report of the American Telephone and Telegraph Co. for 1915 shows that the gross revenue of the Bell system, not including the connected independent companies, was \$239,900,000, an increase of over \$13,900,000 over 1914. After allowing as provision for depreciation \$14,900,000, the available surplus was \$8,520,000, of which \$18,100,000 was paid in interest and \$2,000,000 was paid in dividends. The net permanent capital obligations of the whole system outstanding in the hands of the public amount to \$73,156,756, although the telephone plants stood on the books on December 31st at \$58,006,520 and their appraisal value is over \$61,000,000 in excess of the book value. It is estimated that \$57,000,000 will be spent in plant additions during the current year. *T. and T. Age.*

Wireless Telephony.—According to the *Review Electric*, the American Telephone and Telegraph Co. has recently succeeded in establishing telephonic communication, by means of Hertzian waves, between Seattle and Yokohama, a distance of 7,800 kilometres.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—**SYDNEY.**—May 1st. Two 300-KW. turbo-alternators, condensers, switchboard, &c., for the pumping station at Ryde, for the Metropolitan Board of Water Supply and Sewerage at Sydney.

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-KW. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20a.) from the Engineer's office, 61, Hunter Street, Sydney.

May 24th. N.S.W. Government Railways and Tramways. 16/500-volt D.C. motors for tramway stores, Radwick.

MELBOURNE.—April 11th. City Council. 533,000 arc lamp carbons. See "Official Notices" March 25th.

April 18th. P.M.G. 8,500 fuses.

April 26th. Victorian Government Railways. Car-lighting material—cables, switches, fuses, &c.

May 10th. Victorian Government Railways. Motor-generator set and accessories for battery-charging of baggage trucks.

TAMWORTH (N.S.W.).—May 1st. Additional generating plant, switchboard, mains, &c., in connection with the municipal electricity undertaking. Specifications from Mr. V. G. Kable, Town Clerk, Council Chambers.

Edinburgh.—April 3rd. Midlothian and Peebles District Asylum, Roslynlee. Stores, including electrical fittings. Forms from Clerk and Treasurer, 19, Heriot Row, Edinburgh.

April 1st. Corporation. Maintenance of telephone and electric bell installations: City Superintendent of Works. Engineers' stores, electrical material: Resident Electrical Engineer.

Keighley.—April 3rd. Concrete foundation work for 5,000 KW. turbo-alternator at Coney Lane electricity works. Mr. H. Webber, Electricity Office.

Manchester.—April 1st. Electricity Committee. (a) Low-pressure water and exhaust steam pipes, valves and supports; (b) valves for circulating water pipes. Specifications from Mr. F. E. Hughes, Secretary, Electricity Department.

Salford.—April 3rd. Concrete foundations for 5,000-KW. turbo-alternator. Borough Electrical Engineer.

Spain.—April 13th. The municipal authorities of San Feliu de Guixols are inviting tenders for the concession for the electric lighting of the town during an unnamed period.

May 19th. 60 years' electric tramway concession at Bilbao, to connect the existing system with the Irala-Barri district. An option on the concession is held by the Sociedad Tranvia Urbano de Bilbao. The contract will probably be placed with a Spanish concern, but material will have to be purchased abroad.—*B. of T. Journal.*

Tenders have lately been invited by the municipal authorities of Banolas (Province of Gerona) for the concession for the electric lighting of the town during a period of five years.

Warrington.—April 11th. Electricity and Tramway Committee. Motors and transformers. See "Official Notices" to-day.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Australia.—The following contracts have been placed:—

P.M.G.'s DEPARTMENT, N.S.W.

300 table-pattern common d.c. type telephones, 150 ditto wall sets, and 50 portable telephones, £1,111.—James Paton & Co.

400 automatic wall-pattern common-battery telephones, £1,095.—Automatic Telephones (Aust.), Ltd.

50 miles of twisted-pair conductor wire, £462.—James Paton & Co.

9,740 projectors with lightning arresters, £4,437.—British General Electric Co., Ltd.

P.M.G.'s DEPARTMENT, VICTORIA.

240 common-battery wall-pattern telephones, £257; 240 table-pattern ditto, £729.—Automatic Telephones (Aust.), Ltd.

400,000 insulators, £6,350.—Commonwealth Art Pottery Co. Pty., Ltd.

VICTORIAN RAILWAYS.

15-ton electric crane with accessories, for Bendigo goods traffic, £1,187.—Babcock & Wilcox, Ltd.

Installation of automatic sprinklers and thermostats, £1,314.—Wormald Bros. —*Tenders.*

SYDNEY.—The Electric Lighting Committee recommends the acceptance of the following tenders:—

High-tension cable testing outfit (Specification 423): Section A, £485. Section B (alternative tender), £621. Section C, £785. Section D, £291.

—Aust. General Electric Co.
Weather-proof copper cable (Specification 425), 2600.—B.I. & Helsby Cables, Ltd.

With regard to the tenders received for the 33,000-volt outdoor transformers and switchgear, the city electrical engineer reports that conditions have somewhat altered since he made his recommendations, and it is now improbable that the Council will require during the next two months any additional 33,000-volt transformers and switchgear. He recommends that the firms who have tendered be informed that the Council does not propose to accept any tender at present.—*Tenders.*

London.—**BATTERSEA AND ISLINGTON.**—These Borough Councils have placed contracts for meters for the ensuing twelve months with Messrs. Chamberlain & Hookham, Ltd.

BATTERSEA.—The Electricity Committee recommends that the tender of Messrs. Callender's Cable & Construction Co. be accepted for the supply of bitumen for one year.

WILLESDEN.—The U.D.C. has been recommended to accept the tender of Messrs. Watson, Marsh & Co., Ltd., for re-wiring Block D at the Borough Hospital.

Sutton-in-Ashfield.—U.D.C. Tenders accepted:—

Single cylinder, enclosed type, self-lubricating engine, direct coupled to a 1½-hp. dynamo, £75; switchboard, £10; lamps, &c., £25.—General Electric Co., Ltd.

Wiring firemen's houses for bells, £30.—Geo. Cooper, Mansfield.

West Ham.—Under existing circumstances the buying of transformers is very restricted, but as the engineer considers it desirable to continue to purchase under contract against any requirements which may arise for war or other work, the Corporation has been recommended to extend the British Westinghouse Co.'s contract for a further two years, with the addition of a sliding scale based on the cost of iron and labour.

Whitehaven.—T.C. Earthenware troughs for a year, Messrs. Doulton & Co., Ltd.

FORTHCOMING EVENTS.

London Association of Foremen Engineers.—Saturday, April 1st. At 8 p.m. At Cannon Street Hotel, Cannon Street. Paper on "Copper Alloys, with Notes on Brass Foundry Practices," by Mr. H. L. Reason.

Royal Institution of Great Britain.—Saturdays, April 1st and 8th. At 8 p.m. At Albemarle Street, W. Lectures (IV and V) on "Radiations from Atoms and Electrons," by Prof. Sir J. H. Thomson.

Society of Engineers.—Monday, April 3rd. At 5.30 p.m. At Caxton Hall, Westminster, S.W. Paper on "Modern Coal and Coke Handling Machinery," by Mr. J. E. Lister.

Council for the Organisation of British Industry.—Tuesday, April 4th. At 4 p.m. At the School of Technology, Backley Street, Manchester. Lecture on "Industrial Research," by Mr. A. P. M. Fleming.

Institution of Electrical Engineers (Manchester Local Section).—Tuesday, April 4th. At 7 p.m. At the Engineers' Club. Annual general meeting. Lecture on "Recent Researches in X-rays," by Sir E. Rutherford, F.R.S.

(Western Local Section).—Monday, April 3rd. At the Merchant Venturers' Technical College, Bristol. At 5 p.m., annual meeting; paper on "The Hire and Maintenance of Direct-current Motors," by Mr. H. Joseph. At 7 p.m., dinner.

Association of Supplying Electricians.—Tuesday, April 4th. At 7.15 p.m. At St. Bride's Institute, Bride Lane, E.C. Paper on "A.C. Motors," by Mr. H. C. E. Jacoby.

Röntgen Society.—Tuesday, April 4th. At 8.15 p.m. At the I.E.E., Victoria Embankment, W.C. Papers on "A Chronograph Constructed to Work with the Electroscopie," by Mr. P. J. Neate; "The Enclosed Tungsten Arc as a Source of Ultra-Violet Light," by Mr. B. H. Morphy and Mr. S. R. Mullaard; "Experiments with a Coolidge Tube," by Mr. E. Schall; "A New Modification of the Ionisation Method of Measuring X-rays," by Mr. H. E. Donnanthorne.

Faraday Society.—Thursday, April 6th. At 8 p.m. At the Royal Society of Arts, John Street, Adelphi, W.C. Lecture on "The Making of a Big Gun," by Dr. W. Rosenblin, F.R.S.

Chemical Society.—Thursday, April 6th. At 8.30 p.m. At Burlington House, Piccadilly, W. Ordinary scientific meeting.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, April 7th. At 7.30 p.m. At Bolbec Hall, Newcastle-on-Tyne. General meeting.

North of England Institute of Mining and Mechanical Engineers.—Saturday, April 8th. At 2 p.m. At Neville Hall, Newcastle-on-Tyne. General meeting.

NOTES.

The Batti-Wallahs' Society.—This Society held its annual general meeting on March 20th. Mr. H. T. Harrison is president for the year. Mr. F. Pooley is secretary and treasurer, and Mr. Greenly is entertainment secretary.

An Electric Bullet Extractor.—Experiments have been carried out with a new method of extracting bullets, with the continuous aid of X-rays. The room is darkened, and an X-ray tube is placed below the operating table, throwing the shadow of the bullet and the surgeon's forceps on a fluorescent screen which is fixed above the patient, so that the operator can indirectly see what he is doing. In order to avoid the danger of gripping arteries, &c., together with the bullet, the jaws of the forceps are insulated from one another, and connected in circuit with an electric bell: hence, when both jaws of the forceps close upon the bullet, the bell rings, but if any structure intervenes between the bullet and either jaw, the bell is silent, and the operator knows that the conditions are not right for the extraction of the bullet.

Trade Union Differences.—According to the *Morning Post* a conference between the Executive Committees of the Miners' Federation of Great Britain, the Amalgamated Society of Engineers, and the Electrical Trades Unions, respecting the demand of the miners that engineers and electricians employed at collieries should become members of their Federation, took place in London last week. A joint committee was appointed to draft a scheme for the settlement of the differences between the Unions.

Chief Technical Assistants' Association.—The first annual general meeting of this Association took place on Saturday, March 18th, at the Tavistock Hotel. The Chairman referred to the satisfactory results of the first year's work of the Association, and the following officers were elected for 1916:—Chairman, J. T. Baron; vice-chairmen, T. K. Richardson and W. Young; committee, H. F. J. Thompson and J. H. Parker; hon. treasurer, J. R. J. Bowden; hon. secretary, A. P. MacAlister. We understand that the membership includes practically every deputy electrical engineer in Greater London and, in the large stations, the senior technical assistants, and as consequently it will no longer develop, it has been possible to define exactly the scope of the Association. As it is associated with the Associated Municipal Electrical Engineers (Greater London), questions of policy are not dealt with by the deputies' association, they having resolved between themselves to hold monthly meetings, at which papers on technical matters are read and discussed, thus ensuring that by the informal discussion of matters of vital interest or importance to central station engineers, a thorough interchange of knowledge and experience is arrived at which can only have one ultimate result, viz., the general betterment of the undertakings whose staff is included in the membership. During the past year the following papers have been read (and, where the subject permitted, discussions have taken place):—

The Chairman, in his opening address, embodied details of the undertaking at St. Pancras.

H. F. J. Thompson: "The Advisability or not of Earthing the Neutral of a three-phase High-tension System, and the Best Method of so Earthing"; also discussion on "Safety Devices on High-tension Systems."

J. H. Parker: Discussion upon "Station Economies."

D. M. Mason: "The Principle of High-Tension Switchgear from a Central Station Engineer's Point of View."

W. E. Bradshaw: "The Advantage and Disadvantage of the Various Systems of Laying Mains."

During the coming year it is anticipated that further discussions will take place. The meetings will be held at the Tavistock Hotel, Covent Garden, on the following dates, unless otherwise arranged, at 3 o'clock:—Saturdays, April 15th, May 13th, June 10th, July 8th, September 9th. We have received a copy of the Rules of the Association. Undoubtedly there is a good field for such an Association, and we hope that the intentions of those connected with it, that it shall tend to the elevation of the profession generally, will be realised.

Wolves in Other Dress.—As an example of German "slimness" we may commend to the attention of our readers an important dispatch sent to the Australian Premier from the Trade Commissioner to the East, stating that it has been brought to notice that certain German firms in Japan have commenced doing business in Japanese names, the following being the cases so far brought to notice, the Japanese name being given in parentheses:—Yokohama: Winckler & Co. (T. Miyabe), Bergmann & Co. (Nigo Shoten), Otto Reimers & Co. (Aesda Shokai), Becker & Co. (Kato Gomei Kaisha). Kobe: Bergmann & Co. (Sawada & Co.), M. Raape and Co. (Kato & Co.), Becker & Co. (Toyo Bussan Export Co.), Carlowitz & Co. (Takashito), Winckler & Co. (Kubota Exporting Co.), Van Nierop & Co. (Tanaka T. Goda), V. Hermann, of Siemens, Schuckert & Co. (Kasai & Co.). The dispatch proceeds:—"It is highly probable that other German firms will do likewise, and endeavour to carry on business as usual with Australia and other British possessions. The Japanese laws, so far, afford no means of preventing trading with enemy subjects, but may, later on, come into line. As it is highly probable that the German firms above referred to, as also others, may endeavour to continue business with Australia under the cover of Japanese names, I advise that the strongest measures be adopted in Australia accordingly, and that the Commonwealth authorities should be approached on the matter."—*Eastern Engineering*.

Dundee Electricians' Wages.—Sheriff Laing, Aberdeen, who was appointed arbiter in the wages dispute between the Dundee Electrical Contractors' Association and the Electricians' Trade Union, was in Dundee on 23rd inst., hearing parties' evidence. His award will be issued later. The electricians are asking an advance of 2d. an hour on their present rate of pay, which is 9d. an hour.—*Dundee Courier*.

The Organisation of Science.—At the instance of the Royal Society, a conference was held last week at Burlington House to consider the advisability of forming a "Conjoint Board of Scientific Societies" with a view to the organisation of scientific effort in the national interest. Delegates were present from 25 societies, including the Institutions of Civil, Electrical, Mechanical and Mining Engineers, and a committee was appointed to draw up a scheme for presentation to a future meeting.

Electro-Metallurgy in Finland.—According to the *Wiv Nyh* the Electro-Metallurgical Co. of Ruokolahti, has decided to construct an electro-metallurgical factory near the station of Nokia. The electric current will be supplied by the Nokia Co., which owns the electrical works near Vuoksenniska.

German Tramway Fares.—A general meeting of the Association of Tramway and Light Railway Administrations, following conferences of local groups, has decided to approach the Imperial, Federal, State and local authorities with a view to the general increase of the 10 pfennigs (1½d.) fare to 15 pfennigs (1½d.). It is contended that the future prosperity of the undertakings depends upon the fares being raised, owing to the constant growth in the working expenses.

Electrical Trades Benevolent Institution.—The annual general meeting was held on Monday afternoon, at the Institution of Electrical Engineers. The year book, which had been prepared in the usual form, contained the report of the Executive Committee and the accounts for the year 1915. Owing to the war, the annual festival was not held in 1915; due to the loss of this means of collecting, the income for the year was seriously affected, and no doubt the many other calls on the Institution's supporters, due to the war, have had a further adverse influence. The result of the year's work has been a net income of £663, out of which grants amounting to £149 have been paid, and the following investments made:—£100 3/4 per cent. war stock (subsequently converted into 4 per cent. stock), £94; £300 1/2 per cent. war stock, £295; total, £389. This brings the total of the invested funds to £8,116. The cost of printing, postage, &c., was somewhat higher than in the previous year, as it was necessary to send out an appeal in view of the fact that the annual festival was not held. On the other hand, the other expenses were considerably lower than in the previous year. Sir David Salomons and Mr. Hugo Hirst have been appointed trustees. Owing to the fact that it was easier to find employment for those who applied for help, the number and amount of the grants for temporary relief was less than in 1914, but every person who applied, and who was qualified, received assistance. It is noted with regret that there is a falling-off in the number of persons making use of the collectors' books. The Committee expressed their thanks to those collectors who had again so ably assisted, especially in view of the fact that their task this year was far more difficult than in previous years. The Committee hope that the heads of firms will give this matter their consideration, as every electrical firm ought to have a collector amongst the members of its staff. The Committee again expressed indebtedness to the I.E.E. for the use of rooms for holding meetings, and to the electrical Press for its continued valuable assistance.

Lord Vaux of Harrowden presided at the annual meeting, and, in presenting the report and accounts for 1915, he drew attention to the serious drop in donations, the amount for the year being only £586, compared with £3,139 in 1914. The total income for the year was £886, which he thought, in the circumstances, need not be considered an altogether unsatisfactory state of affairs. In view, however, of the calls which were certain to come after the war, these receipts were totally inadequate. It was hardly to be expected that at the conclusion of the war all men returning would be at once absorbed into civil employment, and although, no doubt, large numbers would be able to return to the positions they occupied previously, which were being kept open by generous employers, it was inevitable that this would not be so in every case, and the calls upon the Institution for pecuniary assistance would undoubtedly be very great. The sum of £389 was invested last year, and it was felt that War Stock was the right investment at the present time. In 1915 the grants amounted to £149, a considerably smaller amount than in the previous year, but the reduction was due to the fact that it was less difficult at the moment to find employment for those requiring assistance. An appeal had been sent out by the President, Sir David Salomons, to a large number of persons, and it was to be hoped that all who received it would realise that they should do all they could for the Institution, notwithstanding the many other pressing claims upon them. Sir David Salomons had kindly accepted the position of trustee, and the securities had now been transferred into the names of Sir David Salomons and Mr. Hirst; the latter was appointed trustee in 1914. These two gentlemen, together with Mr. Justus Eck, were now the three trustees of the Institution. It was sad to notice the falling off in the list of the returns of collectors. In his opinion, every electrical firm should look upon it as a duty to see that one of their staff was a collector, who should also induce other employees and colleagues to become members. If only a sufficient number of people were interested in this way, it would be a most efficient means of obtaining contributions and increasing the membership. It was important to remember that it might become necessary one day to restrict the benefits conferred by the Institution strictly to its own members, and for this reason it was highly desirable to increase the membership in every possible way, for not only would this allow the benefits to be spread over the industry, but it would also appreciably add to the income and possibly enable greater benefits to be conferred. The total number of members at the present moment was extremely small. He regretted the death at the Front of Mr. E. G. Byng, who had done a great deal of work for the Institution. The life governor whose contribution was shown in the accounts was Mr. W. B. Esson, and it was to be hoped that his example would be followed by others. In regard to the balance-sheet, the total investments now amounted to £8,117. The chairman concluded by again pointing out the necessity for increasing the investments, the amount being small compared with similar benevolent institutions.

Mr. Justus Eck, who seconded the adoption of the report and accounts, confirmed all that the chairman had said as to the financial position of the Institution, and the need for increasing the membership and subscriptions. He said he would like to point out a new possible source of income from companies before they closed their books for the purpose of declaring dividends, and that was in connection with the excess profits tax. He believed that all subscriptions to the Electrical Trades' Benevolent Institution would be considered as expenses of a business; therefore, if a company had £1,000 excess profits, and paid £500 of it into the funds of the Institution, it would only be taxing itself £250, whilst benefiting the Institution by £500. At any rate, this was worth trying. As the chairman had said, it would be necessary in future to restrict the benefits to members of the Institution, and in this

connection he mentioned the instance of a mains superintendent who was not a member, but whose widow and two children had been assisted by the funds. In this particular instance the Corporation employing the man stated that they had no powers to assist in the matter, and he put this forward as supporting the appeal to all members of the industry to subscribe and become members of the Institution.

The report and accounts were then unanimously adopted.

Mr. H. Oppenheimer having retired from the Committee of Management, a vote of thanks was passed to him for his services.

The following were re-elected members of the Committee of Management:—Messrs. Justus Eck, E. F. Johnson, P. A. Lundberg, W. C. Mountain, F. H. Nalder, E. A. Nash, W. R. Rawlings, L. G. Tate, Messrs. Price, Waterhouse & Co., were re-elected hon. auditors, and Messrs. Sugden and Hextall, hon. solicitors.

The last business of the meeting was to consider some proposed alterations in the rules. A Sub-Committee was appointed 18 months ago, and decided upon certain alterations, which tend to make the rules a little clearer than they have been hitherto. Thus membership is now defined as life governors, governors, life members, and other members. There is no alteration in the effect of the rules.

The proposed alterations having been adopted, a hearty vote of thanks to the chairman closed the proceedings.

"E.V.C." Standard Batteries.—In the recent announcement of the Electric Vehicle Committee, relative to standardised overall sizes for lead-plate batteries, it should have been stated that the overall sizes agreed upon by the members of the Accumulator Manufacturers' Section of the B.E.A.M.A. are the maximum sizes, the intention being that the dimensions shall cover any maker's cells containing each the same number of plates. This has been done in order that vehicle makers may so construct the battery boxes on vehicles that cells of a specified number of plates of any make may be fitted.

To Wireless Telegraph Engineers.—We are informed that more officers are required for the Corps of Royal Engineers, Wireless Section. Candidates should forward their applications to Major A. Handley, R.E., St. Martin's Gate, Worcester. It is essential that they should have a thorough knowledge of the theory and practice of wireless telegraphy. In sending in their applications candidates should state fully their training and experience, and whether they have had any previous military service. The term of service will be for the period of the war, and successful candidates will be required to serve at home or abroad.

Institution and Lecture Notes.—Institution of Electrical Engineers.—The following have been nominated by the Council for the vacancies which will occur on the Council on September 30th, 1916:—

President.—Mr. C. P. Sparks.

Vice-Presidents.—Messrs. R. A. Chattock and J. S. Highfield.

Honorary Treasurer.—Mr. J. E. Kingsbury.

Ordinary Members of Council, Members (Two Vacancies).—

Messrs. C. Bright, F.R.S.E., F. Gill, G. H. Nisbet, and W. L. Preece.

Associate Members (Three Vacancies).—Messrs. F. W. Cawter,

H. H. Harrison, and W. R. Rawlings.

Associates (Two Vacancies).—Messrs. J. O. Callender and J. Devonshire.

Greenock Electrical Society.—At the annual general meeting the following office-bearers were elected:—

Hon. President.—Mr. Alex. Norwell.

President.—Mr. Duncan Angus.

Secretary.—Mr. F. B. Humphries.

Treasurer.—Mr. Wm. McGibbon.

Association of Mining Electrical Engineers.—At a meeting of the Yorkshire Branch last Saturday, a paper on "The Installation, Erecting, and Starting-up of High-Speed Machinery" was read by Mr. J. A. McLeay, hon. secretary of the Branch. At the next meeting, on April 29th, Mr. J. W. Harbottle will discuss the "Whinney Leakage Detector."

Mr. H. C. Crews, of Manchester, recently delivered a popular lecture on "Electricity in the Home" before the Marple Literary Society, his remarks being illustrated by a demonstration of apparatus in use.

Chadwick Public Lectures.—In the last of a series of lectures on "The Domestic Arterial System," at King's College for Women, on March 29th, Dr. Charles Porter dealt with warming and lighting. In connection with the former, he referred to the various advantages and disadvantages of coal, coal gas, and electricity as heating agents, and expressed the view that, of the three, that which most deserved the claim of being an hygienic heater was undoubtedly electricity. As regarded safety, cleanliness, and convenience, it was ahead even of gas, in favour of which so many claims were advanced. In the matter of cost he showed that, so far as electricity was concerned, installation was the great trouble, but where there was choice in any house as between coal, coal gas, and electricity, he advised that it should fall on the last-named. The many advantages of central heating were also referred to, and it was made clear that much could be said in favour of its adoption, even in the case of ordinary-sized houses. The suggestion was offered that in these days of gas and electric cookers and hot water heaters the kitchen range might very conveniently be abolished. One of the great difficulties in the way of its abolition was the necessity for a fire in the kitchen: in this connection an appliance specially designed for use as a combined sitting-room fire, cooker, and water heater, was described and greatly praised, being cheap to purchase and install, and economical and efficient in use. In relation to lighting, the ordinary artificial agents were described, and their comparative advantages and disadvantages considered. In the view of the lecturer, electricity was the only hygienic artificial lighting agent.

Inquiries.—A correspondent wishes to get into touch with the makers of low-temperature industrial electric furnaces, who can supply particulars of existing installations.

Patents and Alien Enemies.—Application has been made to the Board of Trade by the Rapid Magnetising Machine Co., Ltd., of Birmingham, for the avoidance or suspension of patents Nos. 14,082/08 and 29,230/11, issued to Ullrich, and 4,595/13, issued to Fried. Krupp A.-G. Grusenwerk, for magnetic separating apparatus.

Volunteer Notes.—**ENGINEERING INSTITUTIONS' V.E.C.**
—Orders for week commencing April 3rd, 1916.—By Lieut.-Col. Clay, V.D., Commanding.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Monday, April 3rd.—Sections 1 and 2, Technical; Sections 3 and 4, Squad and Platoon, Signalling Class and Recruits.

Tuesday, April 4th.—School of Arms, 6 to 7 p.m.

Thursday, April 6th.—Shooting for Sections 1 and 2 and Signalling Class.

Friday, April 7th.—Sections 3 and 4, Technical; Sections 1 and 2, Squad and Platoon, Signalling Class and Recruits.

Saturday, April 8th.—Uniform Parade at 2.45 p.m.

Sections for Technical, Parade at Headquarters, London Electrical Engineers, 46, Regency Street, S.W.

Sections for Shooting, Parade at Miniature Ranges.

Unless otherwise ordered, all Parades at Chester House, Eccleston Place, S.W.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, March 30th, 1916.

Battalion Parades.—*Saturday*.—The Battalion will Parade outside Baker Street Station at 2.30 p.m., and proceed by train to Wembley Park Camp, for Parade under Company Officers. Guard duties will be practised.

Sunday (first Sunday in the month).—The Battalion will Parade, as strong as possible, at St. Pancras Station (Midland), at 9.10 a.m., and proceed by train to Chiltern Green, for Field Operations with other units. In the afternoon a march past will take place.

The Battalion will arrive at St. Pancras, on the return journey, about 6.15 p.m.

North London men can travel (single tickets advisable) from King's Cross, 8.50 a.m., to Luton Hoo, calling at Finsbury Park, 8.59, New Barnet, 9.14, Hadley, 9.20 a.m.

Musketry.—Practice will take place at Bisley on Saturday next, the 1st prox., for the Inter-Battalion Match. Targets will also be available for other members of the Corps wishing to shoot. Names must be sent in to the Musketry Staff before 12 noon, Friday. All men proceeding to Bisley must Parade, in uniform, at 12.45 p.m., No. 6 Platform, Waterloo Station.

The Action Range will be open on Saturday, 1st prox., at 2 p.m. Members wishing to shoot must send in their names to the Musketry Staff by first post Saturday morning.

A. G. JOINER, Major and Adjutant, O.B.C.

New Ignition Plug Factory.—According to the *Commercial Motor*, the Lodge Sparking Plug Co., Ltd., of Birmingham, is engaged on the erection and equipment of a new factory for the production of its well-known plugs, on a scale if required, of 10 millions per annum.

Appointment Vacant.—Station engineer for the Southern Command, Salisbury. See our advertisement pages to-day.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—The Battersea B.C. is recommended to grant the following increases to officers in the electricity department:—

Mr. MAGRATH, mains assistant, from £125 to £132 10s. per annum; Mr. KNIGHTS, installation inspector, from £117 10s. to £125 per annum; Mr. ADAMS, clerk, £100 to £107 10s., to take effect from January 1st last.

The West Ham Corporation is recommended to appoint Mr. KING, nominally power representative, to the position of power constructional superintendent at a salary of £156 per annum, plus commission according to scale.

The Coventry Tramways Committee recommends the Corporation to increase the salary of Mr. T. R. WHITEHEAD, engineer and manager of the undertaking, from £500 to £600 per annum.

The Bray U.D.C. has agreed to increase the salary of its electrical engineer, Mr. W. J. U. SOWTER.

The Greenock Corporation has approved of the Electricity Committee's recommendation to advance the salary of Mr. W. B. SMITH, first assistant, by £25 per annum.

Mr. CHAS. W. SALT, A.M.I.E.E., borough electrical engineer of Torquay, has been gazetted as Second-Lieutenant, Royal Engineers (Territorials), London. His private address is "Glenside," Teignmouth Road, Torquay.

General.—Mr. SYDNEY F. WALKER has removed to 85, Shakespeare Avenue, Alexandra Park, Bath.

Mr. E. O. CATFORD, chief electrician and keeper of the Platte Fougère Lighthouse since 1909, is leaving to return to the Edinburgh & District Tramways Co., Ltd., in whose service he was engaged before going to Guernsey.

Mr. F. K. COOKE, secretary of the Unbreakable Pulley and Mill Gearing Co., Ltd., has been appointed secretary of the Cheshire Society in London, the former secretary having resigned and joined H.M. Forces. We have received a very interesting Year-Book of the Society, containing a list of members.

The marriage was solemnised at Blackburn, on March 23rd, of Mr. WILFRED PICKUP, electrical contractor, and Miss Sarah Eccles.

Mr. W. WHITE, a London representative of the General Electric Co., Ltd., has received an appointment in the Aeronautical Inspection Department of the War Office.

Mr. A. W. EMPSON, who has been serving in the Motor Machine-Gun Service for nearly a year, has recently been promoted to the rank of sergeant. Mr. Empson was previously chief engineer at the Merida electricity works, Yucatan, which position he resigned in order to come home and join the Army.

Roll of Honour.—Private NICHOLAS HIGGINS, of the 7th Battalion King's Royal Rifles, formerly a motor tester employed at the Salford electricity works, has been killed in action.

Sergeant R. H. WARD, of the 6th Queen's Royal West Surrey Regiment, reported killed in action in France, was, at the outbreak of war, engaged with Gallender's Cable and Construction Co., Ltd.

Obituary.—MR. GEO. ALFRED NEALE.—The death is announced of Mr. Geo. Alfred Neale, for many years connected with the electrical department of the Hull and Barnsley Railway Co. He was responsible for several innovations in relation to railway signalling by electricity.

Mr. F. W. LACEY.—We regret to learn of the death, which occurred on March 24th, at the age of 60 years, of Mr. Frederick William Lacey, who was for 27 years borough engineer of Bournemouth.

Will.—The late Mr. JOHN WOOD, of Messrs. Mosses and Mitchell, left £14,304.

NEW COMPANIES REGISTERED.

Marshall and Plumtree, Ltd. (143,369).—This company was registered on March 23rd, with a capital of £2,000 in £1 shares, to carry on the business of an electric light company in all its branches, and that of electricians, engineers, &c., and to adopt an agreement with E. Marshall and J. S. Plumtree. The subscribers (with one share each) are: E. Marshall, 6, Netheravon Road, Chiswick, W., electrical engineer; J. S. Plumtree, 39, Vallance Road, Alexandra Park, N., electrical engineer. Private company. The number of directors is not to be more than three; the first are E. Marshall and J. S. Plumtree. Qualification, 200 shares. Remuneration as fixed by the board. Registered office: 20, High Holborn, W.C.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Engineering and Arc Lamps, Ltd.—A memorandum of satisfaction to the extent of £1,000 on March 31st, 1916, of debenture dated May 26th, 1911, securing £6,000, has been filed.

Hong-Kong Tramway Co., Ltd.—A memorandum of satisfaction to the extent of £23,400 on various dates between January 19th and March 2nd, 1916, of trust deed dated July 1st, 1914, securing £195,000, has been filed.

Electric Furnaces and Smelters, Ltd.—A memorandum of satisfaction on various dates from May 31st, 1913, to November 30th, 1915, of debentures (no dates given) securing £9,200, has been filed.

Priestman Bros., Ltd.—Particulars of £5,000 debentures, created February 25th, 1916, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: Freehold and leasehold land and fixed machinery, subject to existing mortgage on part of freehold properties, securing £1,200 and the company's undertaking and other property, present and future, including uncalled capital, ranking after a prior lien debenture for £10,000. No trustees.

Webb Lamp Co., Ltd.—Particulars of £1,500 debentures, created December 30th, 1914, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the amount of the present issue being £1,000. Property charged: The company's undertaking and property, present and future. No trustees.

C. W. Hacking and Co., Ltd.—Particulars of £600 debentures, created April 19th, 1916, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's property, present and future, including uncalled capital. No trustees.

CITY NOTES.

Metropolitan Electric Supply Co., Ltd.

Mr. W. HARRISON CRIPPS presided on March 22nd, at Salisbury House, E.C., over the annual meeting of this company. The proceedings lasted over two hours, and the great hall was filled with shareholders.

The CHAIRMAN, in proposing the adoption of the report, said the capital expenditure showed an increase of just over £30,000 in the year. The bulk of the capital they had been spending in the past few years had been employed in laying mains, putting up plant, and generally providing for their increasing business in the western area, and it was some years before they got an adequate return. The gross revenue showed an increase of £14,000. He thought the increase was somewhat remarkable, considering the difficulties under which they had been working. Owing to the Government regulations as to lighting they had lost a very large amount of that part of their revenue. It was 20 per cent. less than it was in the year before the war, which meant a loss in revenue of something like £33,000. With such a loss, and with a considerable increase in costs, it was very satisfactory that they were able to make a considerable advance in their gross income, and some increase in their net income. The costs showed an increase of about £13,000. Almost the whole of that was due to coal, and lately they had had to pay something like 30 per cent. more for coal than in 1915, and even then it was of a very inferior quality. The chairman drew the attention of the shareholders to a large cartoon on the walls, showing the figures of the other electric supply companies in London from their published accounts, and said that all the companies mentioned were either in their district or touching their borders. He pointed out that they had all had losses to a certain extent during the year, and at most of the meetings the chairmen told their shareholders that it was a very fortunate and lucky thing that their losses of revenue were so small. One of their competitors—although they worked in perfect harmony with them—the County Co., said at their meeting that they had done as well, if not better, than any other company. That was said by the managing director, and it was perfectly true when he made the statement, as the accounts of this company did not come out until a few days after. There was one company which had done better than any of those mentioned, and it was the only one which had made an actual increase during the year, and that was the Metropolitan Co. They were carrying forward £27,000 out of their net revenue to reserve, which otherwise could have been divided as dividend. It was the largest amount they had ever placed to reserve in any one year, and was £5,000 more than last year. They gave the matter great consideration, but none of them knew what was going to happen month after month during this terrible war, and it was considered wise to keep a little bit more in hand in case of unforeseen emergencies. Their reserve fund was as good, if not better, than that of any London company. They had put £37,000 to reserve, and, as he had told them before, they were really better off than that, because when they sold the Marylebone property they had already put by a considerable sum against the depreciation of the plant there, and the whole of the cost of their plant was given them back at absolutely the price they gave for it, and therefore, although there was no depreciation, they kept the money, and did not take it away from the reserve fund, and there it was now as against comparatively new plant. The progress of the company had been very remarkable during the last year or two, and that was especially so as regarded their power supply. When he told them that in the last two years their power supply had increased by nearly 4,000,000 units, which represented something like 50 per cent. of the supply in the year before the war, they would see the great progress made in that respect, and that progress was still continuing in a remarkable way. Taking the period from January 1st this year as against January 1st last year, they had been turning out 20,000 more units per day, which meant something considerably over one million units in that particular period. But in addition to that, having increased their prices for power, they were a little anxious as to whether people would say that they did not want the dear article, but, as a matter of fact, they had hardly had a complaint. They must remember, when speaking of charges for power, that the smallest fraction in a unit made a great difference when they were talking in millions of units. A tiny fraction added to each unit made all the difference between a loss and a little extra gain, and thus became a valuable asset. In other words, they were selling a very much larger number of power units at the present moment, and at a considerably better price than they obtained a year and a half ago. It was quite impossible for any of them to forecast what was going to happen in the present year. It could only say they were giving a large supply and getting a good price for it, but what the price of coal was going to be, on which, more than anything else, the net profit depended, neither he nor anyone else could say. He felt very truly that one of the first things that would happen after the war was that they would be able to get their coal and other commodities at a great deal easier than they could now, and it was quite certain that having experienced two years' darkness in London, when the Zeppelins were abolished the first thing they would see would be a brilliantly lighted Metropolis, and then their company would get some of their losses back. They regretted having lost two of their old colleagues on the Board, Lord Abercromby and Sir James Pender, and in their place they had elected Mr. Monneriff, who was thoroughly experienced in finance, and Mr. Geoffrey Blackwell, a partner in one of the most honoured firms in the country and a very large customer of the company. They had appointed Capt. Rendell as general manager. There was

another director whose name was not mentioned in the report, and that was Mr. Tuckett. That gentleman was appointed in October, but was abroad at the time, and was unable to attend any of the meetings of the board until the beginning of January. Having attended two board meetings, for reasons best known to himself, he thought it desirable to resign, and so they only had the advantage of his services for a couple of weeks. Having referred to the loyal services of the staff, the Chairman proceeded to deal with a circular which had been signed by a number of shareholders and sent to all of the holders of shares. He said he did not intend to speak in a hostile manner of the circular, because he did not feel in the slightest sense hostile to those gentlemen who had signed it. There could be no possible objection to any shareholders sending a circular to their fellows, but if it was sent as an *ex parte* statement, then it was incumbent upon them to take every care to see that the statements therein were absolutely accurate, and that nothing was misleading. He ventured to say that without an explanation this circular was misleading. The circular said that the dividend had dropped from 10 per cent. to 3 per cent., and it went on to say that that seemed to have had such an effect on three members of the board that they had found it necessary to resign. That was the inference. It was quite true that the company did pay 10 per cent., but why did the signatories to the circular take the year 1905 and compare it with the war year of 1915? In 1905 they were supplying Marylebone, and their gross revenue that year was £265,000. In the succeeding year, Marylebone was cut off, and their revenue at once fell to £175,000. But that drop had been foreseen, and the arbitrator awarded them £662,000 for that loss—that was for the goodwill of the business they had lost. Of that money £600,000 was returned to the shareholders, who got £6 for every £10 share, and the remaining £62,000 was carried to a special fund in order to help them for a year or two afterwards and increase the dividend for the time being. They could not have their cake and eat it too. They had already had their compensation, and the complaint in the circular seemed to be that they were not getting the dividend as well. That was the explanation of the drop in the dividend. In 1905 there was £122,000 to divide, and the next year there was £66,000; then they got £67,000, and next came in the metallic-flament lamps, with the result that for the next three years there was a gradual falling off in the profit; 1911 was the bottom year. In 1912 their profits began to ascend, and 1913 was a better year still. Then came the war, and he asked any of the shareholders if the board was responsible for that. He did not know the reason why the three members of the board retired, but he knew that when they left they wrote quite proper letters to their colleagues, and there was not a single mention made as to the falling-off of dividend. They all mentioned that they resigned because they did not agree with the internal reorganisation of the company. He had shown there was no cause for alarm in the sudden drop in the dividend, but he would at once say that some of the board had not been altogether satisfied with the management. Before the war some of the directors went into matters very carefully, and came to certain conclusions. Those conclusions were mainly that the charges for their power supply had been allowed gradually for one reason or another to get pretty low for certain large customers, and they thought it desirable that those customers should be raised up to what might be called the standard level which they had in other districts. Some of them on the board thought there ought to be a readjustment in those prices, and others thought it would be better to leave things as they were. Some of the board thought it desirable to reorganise their scale of charges, and that was done, and they already saw the advantage of it. They also looked very carefully into some of the bigger contracts, and came to the conclusion that they ought to readjust them as soon as they fell in, although some would not expire for some time. They found they were losing upon some of those contracts. Of course, the board were responsible for that, but they had always acted upon the advice of their experts. Then some of the board thought it desirable to revert to the old system which was in vogue when Mr. Conacher was there. At that time the engineer made his estimates and then they went before Mr. Conacher, who carefully examined them. They thought it would be better to set free their manager, so that he should have more time to attend to the engineering department, and appoint a purely business manager to take the place of the general manager. That principle of divided management was agreed to by everyone on the board, and it was only when, some months afterwards, they came to fix as to who did this and who did that that there was divided opinion. He contended that reforms had actually been accomplished which would be to the advantage of the company, and one great benefit to the company was that at the present moment the board was absolutely united. The Chairman then spoke of the damage which would be done to the credit of the company by the publication of statements which were not really accurate, and coming again to the circular, which was signed by Sir Gerald Buxton, he said that the board had written to Sir Gerald saying that they were quite willing to have a committee of investigation appointed consisting of two shareholders to be nominated by themselves, and one nominated by the board, and the company suggested that Sir Melville Beachcroft, a late member of the L.C.C. and the Water Board, should act as one of the committee. Sir Gerald Buxton had written

accepting that suggestion, and, at a later stage, a resolution would be moved with regard to the committee.

Mr. GEOFFREY BLACKWELL, in seconding the motion, said he had joined the board after careful inspection of the balance sheet and accounts and books, with the result that he believed the company was an absolutely sound one and capable of better things than it had recently achieved. The results had obviously been unsatisfactory to the shareholders in recent years, and it was clear to him that some drastic alteration in the management and the policy of the company should be tried. He agreed absolutely with the chairman that it was an unfortunate thing at any time that the functions of a manager and the chief engineer should be united in the same person, as had been the case with that company in the past few years.

The policy of the present board was to get higher rates for current and to rigidly restrict capital expenditure, although it would be foolish not to recognise that, with coal at its present price and with the chances of its going higher in the future, it was going to be a slow and difficult matter to improve the condition of the company to an extent which might be possible in more normal times. If, however, after a fair trial their policy did not produce improved results, then he, personally, would be only too ready to vacate his seat on the board.

After some discussion as to procedure, and explanations regarding losses made on the realisation of certain securities, the report and accounts were adopted.

Mr. GREGORY, one of the signatories to the shareholders' circular, said that for some time those associated with him, and he himself, had taken a great interest in the affairs of the company, and they found that the dividend had, with the exception of one year, been steadily declining since 1905. They found, also, that there were serious differences of opinion on the board, and they came to the conclusion that the affairs of the company were not altogether in a satisfactory state; and then, just on the eve of the issue of the report, they found that the directors who, in their opinion, had the greatest experience and technical knowledge of the supply of commercial electricity, had all resigned, and that the general manager, who was an acknowledged expert on the subject, had been shelved. Under these circumstances, he was certain they would all feel that their affairs did require a little further thought and attention. He ventured to think the terms of their circular were most moderate. They did not attempt to force down the throats either of the board or the shareholders any particular line of policy. All they asked for was a fair and impartial investigation. They did not get the agreement of the board to the appointment of a committee until their proxies were lodged, and he believed the signatories to the circular represented about half the shareholders, and about half the value of the shares.

The CHAIRMAN said he did not know how Mr. Gregory arrived at his figures, as more than half the shareholders had not sent proxies at all.

Mr. GREGORY said he had over 70,000 votes and over 800 proxies. It was not material except that he wished the shareholders to know that those who had moved were substantially supported.

Sir JOHN D. PENDER moved:—"That Mr. W. S. Poole, Mr. J. R. B. Gregory, and Sir Melville Beacheroff be appointed a committee to examine into the affairs of the company, and to report to the shareholders as to the past and future conduct of the business of the company, with power to examine the books, accounts, and officers of the company, and to employ such expert and other assistance as they may require for that purpose; and that the expenses of the committee and the expenses incidental to the circular of March 7th, 1916, be paid out of the funds of the company; and that this meeting be adjourned until Tuesday, May 2nd, 1916, or such later date as may be arranged by the committee." He explained that the reason why he signed the circular was because his name was on the original prospectus of the company, and at the start he had a good deal to do with the management of it. About 1894 he had to relinquish his seat to take up cable work. Under those circumstances he did not like to see the company going down.

Mr. JOHNSTON seconded the resolution.

Mr. TUCKETT, in the course of a very lengthy speech, said he was a director who had resigned his seat, and had listened to the speech of the chairman with astonishment. The chairman, in some particulars, had completely abandoned the attitude which he had maintained for some years. It seemed to him the chairman was hardly competent to come that day and pretend that he was in agreement with directors who had been forced off the board owing to his absolute disagreement with them, whilst at the time the general manager had been also unable to agree with the policy. Were it not that the chairman and Mr. Harris had during the past two years made certain reports, to which he had referred, he thought he would have found considerable difficulty in persuading shareholders that anyone could at this stage of the electrical industry hold such views. Mr. TUCKETT proceeded to give quotations from the reports of Mr. Harris and the chairman, which, he said, embodied some of the principles upon which it was proposed that the business of the company should be conducted. The quotations were:—"The question as to what the consumer can afford to pay, or at what price another company can afford to sell, has nothing to do with the Metropolitan Co." "A power load of this sort at £4 and a halfpenny per unit neither pays us nor any London company." "All

power prices should be raised to a minimum of 1½d. per unit, and any consumer refusing be disconnected." "As regards power, largely increased prices are, in my view, essential. We shall doubtless lose some of our customers, and connect a smaller number of new ones in the future, but this will be an advantage to the company, as it will set free capital and plant which we shall gradually absorb in supplying a more paying class of business." Dealing with the quotations seriatim, Mr. TUCKETT characterised the first as an extraordinary uncommercial proposition. The second dogmatic assertion was made in connection with a large power contract which, he was glad to say, Lord Avebury and Sir James Pender persuaded the board to accept. At present it was returning the company a profit of 13 per cent. Incidentally, he might remark that £4 and a halfpenny per unit was by no means a low or unremunerative price, and there was no London company he knew of which would not welcome such a load at such a cost. They had only to ask any electrical man what he thought of the statement that all power charges should be raised to a minimum of 1½d. a unit, and he would tell them. There were power contracts under 1d. which paid better than others at 1½d. or 2d. It all depended on the nature of the load and the circumstances of the case. Owing to an increase in the power load happening to coincide with a period in which there was no very marked increase in profits, the chairman and Mr. Harris jumped to the conclusion that the power load was unprofitable, and instead of listening to Mr. Highfield, who repeatedly pointed out the true explanation of the results shown, viz., the serious reduction in the lighting revenue and the heavy increase in the price of coal, they set to work to prove their contention by making a series of elaborate calculations which were entirely erroneous and misleading. The standpoint of the chairman was expressed in the following quotation:—"I have not found, as regards the Metropolitan Co., any figures or arguments to show that the works costs of generating a power unit are any less than the works cost of generating a lighting unit. The destination of any unit seems quite immaterial as regards the cost of its production." Consequently, he arrived at the conclusion that every lighting unit sold at more than 1½d. per unit represented so much profit, and every power unit sold at less than 1½d. represented so much loss. The whole argument and the conclusions to which it led were utterly fallacious, but it was, nevertheless, on a policy founded on these conclusions that the business of the company was to be conducted. In conclusion, Mr. TUCKETT referred to the position of Mr. Highfield, who, he said, became manager in 1911, and in face of very great difficulties had succeeded in materially improving the position of the company, as would have been apparent to all of them but for the war. Mr. Highfield's insistence on the development of the power and Western area loads, in face of very indifferent encouragement from the board, had gone a long way towards making good the heavy increase in costs and the serious drop in the lighting revenue due to the war. Just as the directors who retired were unwilling to share the responsibility for the policy which the board were inaugurating, so equally Mr. Highfield was unwilling to be a party to carrying it into effect, and no one could blame him, for no one with any regard to his reputation as a business man could afford to associate himself with a policy of sheer stagnation.

Mr. LEVERTON HARRIS, M.P., said it was difficult to reconcile Mr. TUCKETT's assertion that Mr. Highfield had made the company a success with the fact that the circular had been issued. He stuck to every word he had written in reports made to the board which had been referred to by Mr. TUCKETT. The increase in the cost of power had been reasonably received, and he looked for considerable extra revenue from that in the future. He had shares in a number of companies of which Mr. TUCKETT was a director, and he did not know of any electrical companies with which he was associated that had achieved any success. The policy of the board was to cut off consumers who did not pay them, and to try and make the Western area a success, but without spending too much new capital.

Mr. A. SAMUELS appealed to the shareholders to support the chairman, seeing that he held £60,000 of the company's stock.

Several other speakers having addressed the shareholders amidst repeated calls of "Time," the resolution was put and carried.

The auditors having been re-elected, the meeting stood adjourned till May 2nd.

Evered and Co., Ltd.

The net profit for 1915, after providing for debenture and other interest £2,172, income-tax and reserve for war taxes £9,169, and war bonus £2,000, is £22,056, plus £1,925 brought forward. A dividend of 7½ per cent. for the year, free of income-tax, absorbs £12,806, £3,000 is written off plant, £6,000 is placed to reserve, and £2,176 is to be carried forward. The works have been and still are busily engaged on important works. The general trade (home and export), while necessarily suffering from war conditions and the diversion to war work of so much labour and material, has been maintained better than, in the circumstances, might have been expected. The £2,000 mentioned above has been set aside as a war bonus for the staff and certain directors acting as managers. The work of the year has involved unusual efforts on the part of the management and staff.

Brompton and Kensington Electricity Supply Co., Ltd.

The revenue account for 1915 shows a credit balance of £26,385, plus £5,626 brought forward, and £384 balance of interest received and accrued, and £3,000 is transferred from reserve fund account, making a total of £35,095. After paying the preference dividend of 7 per cent., a further dividend on the ordinary shares of 11 per cent. per annum for the half-year is paid, making 10 per cent. for the year, as in 1914. There is written off the cost of investments £262, and off the shares in and advances to the Brompton and Kensington Accessories Co., Ltd., £3,000; there is placed to credit of depreciation account, raising it to £80,000, £6,394. Directors' additional remuneration accounts for £678, and £5,012 is to be carried forward. The equivalent lamps connected increased by 17,054 to 327,292, and the number of consumers from 6,350 to 6,512. The gross receipts increased from £56,370 to £56,489, and the expenditure from £26,009 to £30,074. The net receipts fell from £30,271 to £26,385. The average price per unit obtained was 4d. as against 3.92d. in 1914. Annual meeting, April 3rd.

Cleveland and Durham Electric Power Co., Ltd.

The capital expenditure on works in 1915 was £9,181. The gross profits, which amounted to £31,157, have been adversely affected by the higher cost of coal and the greater consumption which had been necessary to make up the diminished output from the waste heat generating stations, and also by increases in wages, costs, stores, and other items. After providing for debenture interest, there remains a net profit of £10,972, which, with £8,277 brought forward, makes the available balance £19,249. After paying a dividend of 2 per cent. on the preference shares, absorbing £6,674, transferring to depreciation and renewals £3,000, and putting to reduction of expenses of issue of debentures £1,000, there is carried forward £8,575. The connections to the system aggregated 75,840 h.p., as compared with 66,627 h.p. connected at the end of 1914, an increase of 9,213 h.p. connected. A further 5,785 h.p. has been arranged for.

Arbroath Electric Light and Power Co., Ltd.

MR. GEORGE BALFOUR presided at the annual meeting. The report for 1915 showed a profit of £1,895, plus £900 brought forward, making £2,804, less interest charges £599, and dividend on preference shares £364, leaving £1,840. Of this, there is to be applied to reserve fund (making it £3,000) £1,000, and to be carried forward, subject to directors' and auditors' fees, £840. Mr. Balfour said the directors had every reason to congratulate themselves upon the result of the year's trade, keeping in view the abnormal conditions now obtaining. The increased cost of coal, wages, and other commodities naturally militated against the company securing the full benefit. Notwithstanding these adverse factors, the net revenue showed an increase of £400. At the beginning of October the price of electricity was increased to both lighting and power consumers, and during the current year the company would obtain the benefit of the increased prices as an offset, at any rate, against a large portion of the increased expenses.

Salisbury Electric Light and Supply Co., Ltd.

MR. C. J. WOODROW, presiding at the annual meeting on March 21st, said that, considering the circumstances, they had had a very good year. No less than 40 per cent. of the staff were with the Colours, which meant that there was a good deal of anxiety in carrying on a business of that kind. After referring to the increased cost of materials, &c., the chairman said that the revenue from sale of current was £9,322, as against £8,202. The balance on revenue account, £5,342, was £700 more than a year ago. A higher dividend than that recommended might have been paid, but it was wiser not to do so, remembering the uncertainties of the present situation and the Lighting Restrictions Order. They congratulated Mr. Randall, the engineer and manager, on enabling them to present such a satisfactory statement. They were carrying £2,400 to reserve, making it £22,454, so that whatever might happen they were in a strong position.

Bombay Electric Supply and Tramways Co., Ltd.

An extraordinary general meeting of this company was held in London, on March 14th, to consider resolutions providing for the transfer of the control of the company from London to Bombay. The CHAIRMAN, SIR CHARLES OLLIVANT, explained that the postponed transfer was on account of their present liability to double income-tax, and that the meeting had been called on the requisition of Bombay shareholders—they had on their Bombay register 4,390 shareholders with five shares or less. They had twice memorialised the Government for legislative relief, but without success, and now were advised that they would be exempt from liability for British income-tax if the control of the company's affairs were to cease to be located in the United Kingdom, and that such transfer would not impair their legal status as a British company. Mr. AGNEW TURNER, representing Bombay shareholders, pointed out that there would be a saving of income-tax alone of £17,000 by the transfer. The resolutions were passed on a poll, showing 86,660 votes for and 5,754 against the proposal.

Automatic Telephone Manufacturing Co., Ltd.

Presiding at the fourth annual meeting, at Liverpool, on March 25th, Mr. JAMES TAYLOR said the profits for the year were £41,867, an increase over the previous year of £3,620. After payment of the preference and 4 per cent. ordinary dividends, providing for depreciation, and writing off preliminary expenses, &c., a balance of £6,774 remained to be carried forward. During the year the company succeeded in completing and bringing into service automatic telephone exchanges at Rosario, Newport (Mon.), Accrington, and Chesham, as well as some smaller exchanges. In cases where a 24-hour day was worked with a small exchange, it frequently became desirable to install an automatic exchange as compared with eight-hours-a-day conditions, because three operators instead of one were displaced. The company had in hand automatic exchanges at Portsmouth, Paisley, Leeds, and Blackburn, but progress was slow, and the Leeds exchange might be further delayed on account of a large extension. All the automatic exchanges in this country, as well as in Argentina and India, were working quite satisfactorily. Cash in the bank and in hand at the end of the year amounted to £54,000, out of which £15,000 had been invested in Government securities.

British Insulated and Helsby Cables, Ltd.

The annual meeting was held at Liverpool on March 25th. Mr. JAMES TAYLOR, who presided, mentioned that the company had done a very much larger volume of trade than ever before, many of the branches working continuously night and day. Several new lines of manufacture had been undertaken, and they had endeavoured to obtain foreign business in the open markets with considerable success. At the time of the last annual meeting 625 men had left to join the Forces, and this number had been increased during the year. In addition to ordinary capital expenditure on the business, they had erected a new dining-hall at Prescott for their workers. Stocks and work in progress had increased by £202,000, largely owing to the increased cost of copper, lead, and other raw materials, which had risen to an unprecedented extent. After careful valuation, the directors were of opinion that, despite general depreciation, the value of their securities reached a figure in excess of that in the balance sheet. After Mr. H. C. WOODWARD had pointed out that the directors were in the happy position of having paid the dividend out of the "carry forward" from the previous year, and urged a more generous distribution of profits, the report and accounts were adopted.

Charing Cross, West End, and City Electricity Supply Co., Ltd.

At the annual meeting, on March 9th, the CHAIRMAN, Mr. W. F. FLADGATE, in moving the adoption of the report and accounts, pointed out that the drop in net profit on the West End business compared with 1914 was only £3,500, while in the first year of the war the falling off was nearly £12,000. They had recommended a dividend of 5 per cent., to pay which recourse would be made to the dividend reserve account to the extent of £6,000. The result of putting £22,000 to depreciation was that the West End undertaking had now some £171,000 standing to the credit of that account. The war affected the City net receipts by about £2,500 in 1914, and this had been increased last year by some £3,000, but they were able to pay debenture interest, preference dividend, and to carry forward £15,300 to general reserve in respect to the City undertaking, bringing the total to over £86,000. It had been impossible to attempt in any way the amalgamation of their company with others, or to negotiate further with the L.C.C., these matters being deferred till after the war.

Bromley (Kent) Electric Light and Power Co., Ltd.—During 1915 the connections increased from 4,089 to 4,254 r.w. There was a profit of £12,150, including £1,621 brought forward, and after paying debenture interest and trustees' fees amounting to £2,979, there is a balance of £9,172. An interim dividend at the rate of 4 per cent. per annum was paid for the half-year in October, and a further dividend at the rate of 8 per cent. per annum, making a total of 6 per cent. per annum, is recommended, £3,000 being placed to reserve and £1,672 carried forward.

Braunton Electric Light Co., Ltd.—The net revenue balance for 1915 was £251. After paying the preference dividend, 2½ per cent., less tax, is to be paid on the ordinary shares, £30 is to be written off formation expenses and 5 per cent. for depreciation of machinery, plant, and accumulators, 7½ per cent. off motors, and 2 per cent. off mains, cables, and services, which will amount to £115, leaving to carry forward £25. At the annual meeting the directors were complimented on the success of the company.

France.—A new company has just been formed in Paris, with a capital of £8,000, and the title La Société des Magnétos and Appareils Électriques S.A.M., to manufacture ignition magnets and other electrical apparatus. It is also announced that the Société d'Électricité Nilmeior, of Paris, the makers of the Nilmeior magnets, has reduced its capital from £50,000 to £20,000.

Reduction of Capital.—*British Vacuum Cleaner Co., Ltd.*—In the Chancery Division, Mr. Justice Neville on Tuesday sanctioned a reduction of the capital of this company. Mr Manning, who represented the company, said it was proposed to reduce the capital by a sum which had been lost or was unrepresented by available assets, and creditors were not affected. The company was incorporated in 1903 with a capital of £100,000, divided into 100,000 shares of £1 each. The company had been involved in a considerable amount of litigation in support of their patent, more than one case having been taken to the House of Lords; a large portion of their plant had become obsolete and had had to be replaced, and shares in subsidiary and foreign companies had fallen in value. For the last two years the company had traded at a loss, and there was no prospect of the lost capital being recovered. His lordship sanctioned the reduction, in accordance with special resolutions passed by the company, to £90,000.

British Aluminium Co., Ltd.—According to the *Financial Times*, the profit for 1915, together with interest and dividends on investments and deposits, and the revenue derived from Kinlochleven and Foyers estates and transfer fees, is £312,547, plus £24,751 brought forward, making £337,298. As provision for income-tax, legal expenses, bad and doubtful debts, depreciation and proportion of profits payable to directors there has been set aside £41,265, reserve for depreciation £50,000, and to reserve account £70,000. The directors recommend a dividend of 7 per cent. per annum, less tax, on the ordinary shares, carrying forward £24,791. Sales are approximately the same as in the previous year, and, although prices showed considerable advances during the latter part of the year, a large portion of the output was under contract at fixed prices for the whole year.

Newmarket Electric Light Co., Ltd.—During 1915 the equivalent of 692 lamps were connected, making 31,436 total. Including £151 brought forward, the profit for the year was £2,121, which, after providing for debenture and other interest £721, leaves £1,400. A dividend of 2 per cent. is recommended. £650 is to be carried to reserve for renewal of plant, and £219 is to be carried forward. The annual meeting was held on March 20th; the CHAIRMAN, Mr. F. E. GRIPPER, in submitting the report, pointed out that there had been a reduction in revenue, while working expenses remained practically the same; as a final result they had a net balance of £331 less than last year to deal with. A large increase in the coal bill was expected in the coming year, the price having risen from 10s. to 22s. a ton, and it was hoped to recoup the extra cost by an increase in prices. The total equivalent 33-watt lamps connected at the end of 1915 was 31,436.

Alley and Maclellan, Ltd.—For 1915 there is a profit, after providing for excess profits in respect of 1914 and including £1,908 brought forward, of £26,284. After putting £10,010 to depreciation, a dividend of 6 per cent. on the ordinary shares is to be paid, leaving £9,105 to be carried forward.

Folkestone Electricity Supply Co., Ltd.—The profit for 1915 is £16,759, plus £1,438 brought forward. £5,000 is carried to depreciation, £500 to reserve, and 7 per cent. for the year is to be paid on the ordinary shares, carrying forward £2,601.

Prospectus.—The *Times* states that the Scott Electrical Co., which has a share capital of £100,000, divided into ordinary shares of £1 each, is offering for subscription 70,000 shares at par. The company proposes to manufacture complete starting and lighting sets, and also other electrical accessories for motor-cars. The vendor company is the Efan-dem Co., of Wolverhampton, and the total purchase price will be about £11,000 for patent rights and other assets.

Vickers, Ltd.—The directors announce that, under existing circumstances, the accounts for the year 1915 must necessarily be delayed. In the meantime it has been arranged that the final dividend of 2½ per cent. on the preferred 5 per cent. stock and on the 5 per cent. preference shares will be paid on the 30th inst.—*Financialist*.

Simplex Conduits, Ltd.—Including £3,647 brought in, the accounts for 1915 show a disposable sum of £22,127. The directors recommend a dividend of 10 per cent., with a bonus of 5 per cent., transferring £2,500 to reserve, and carrying forward £11,008. For 1914 a similar dividend was paid, but no bonus.—*Financial News*.

Aldays and Onions' Pneumatic Engineering Co., Ltd.—An interim dividend at the rate of 5 per cent. per annum (6d. per share), less income-tax, on the ordinary shares is announced.

Stock Exchange Notices.—Application has been made to the Committee to allow the following to be quoted in the Official List:—

British Ever Ready Co., Ltd.—85,000 seven per cent. cumulative preference shares of £1 each, fully-paid, Nos. 1 to 85,000.

STOCKS AND SHARES.

TUESDAY EVENING.

Confidence in the Stock Exchange is the corollary to the confidence felt in the country with regard to the issues of the war. That the struggle is nearing its last phases is generally agreed. There are so many indications that the end must be approaching; and so far as Germany's latest loan is concerned, nobody believes that the money which she trumpets as having raised is what we on this side call new capital. Nobody has a fixed date at which the enemy is likely to sue for peace, but the probability of the termination of the war some time, say, within twelve months, is sufficient to hearten people who know that the balance of men, money, munitions and material is all on the side of the Allies.

One of the features during the past few days has been a continuance of the brisk rally in the Home Railway market, prices of the steam stocks going ahead sharply. Amongst them, South-Western deferred gained several points—partly on the idea that the company will benefit from resumption of Continental traffic upon the conclusion of the war, partly because of the statement that the electrification of the line is proving a great success. Underground Electric income bonds recovered their loss of last week, and have risen to 8½. Districts and Metropolitan are both better. Central London stocks keep about the same as they were.

In regard to Districts, it would not take much buying to raise the price to 20; and this level is quite likely to be touched if the strength of the market as a whole keeps up. It has to be remembered, however, that a good deal of nursed stock is only waiting for a favourable opportunity for realisation; and this factor will hold prices back to some extent until the demand from the public has absorbed whatever may come on offer.

The Metropolitan Electric Supply Co.'s meeting produced a good deal of criticism, but the discussion was less acrimonious than seemed likely in advance, having regard to the extremely pertinent character of the circulars that preceded it. The chairman laid the position before the shareholders with a good deal of frankness, and, in the end, a committee of three was appointed, with the assent of the board, for the purpose of examining the position, and seeing what could be done to help in the restoration of the company's former prosperity. On the strength of this, the shares rose ½ to 2½, but in other parts of the electric lighting list the only changes are falls of ½ in Westminster's and of the same fraction in City of London preference, taking the prices to 5½ and 10½ respectively. Counties keep good at 10½, on their excellent dividend and meeting. There has been a little inquiry for some of the preference shares to which we drew attention in this column last week, and evidently the figures that we quoted as to yields have attracted the notice of the investor as good-class industrial shares.

The Brompton and Kensington report for 1915 shows a reduction of £2,000 to £17,000 in the net profit. To maintain the dividend of 10 per cent., £3,000 has been withdrawn from the reserve. The Bromley (Kent) Electric Supply Co. announces a dividend of 6 per cent., as against 7 per cent. this time last year, which must be accounted a good result for a suburban undertaking.

Considerable disappointment is felt at the dividend on British Westinghouse preference being retained at its previous level of 7½ per cent. Ten per cent. at least had been looked for, and some thought that this rate might be exceeded. The declaration brought in sellers, with the consequence that the price fell 4s. 6d. to £2, which includes the dividend; so that at the present price the return is over 7½ per cent. on the money. The British Aluminium, on the other hand, has increased its distribution from 5 per cent. to 7 per cent.; and the shares are a good market at 23s. 9d. It will be noticed that other manufacturing issues connected with electric supply are keeping steady.

At the meeting of the British Insulated and Helsby Cables, Ltd., held at Liverpool on Monday, the chairman's speech showed that the company had secured a record profit for the year. One of the shareholders thought that the board might have "stretched their consciences a little bit," and given the shareholders more; where to the chairman replied that if profits still continued in future, the directors would consider the possibility of a larger dividend, and would not begrudge it if it seemed feasible.

Brazilian Traction common shares are a better market at 53. City Services common shares rose to 143 on substantial buying orders from the United States. Canadian industrial shares gave way in sympathy with Americans, which dropped smartly on premature rumours with reference to peace, but there was a fairly quick recovery. The Mexican position is read as being rather better. Mexico Tramways 5 per cent. bonds rose 3 points to 38, though Mexican Light preferred fell a similar extent to 32—which, by the way, is only 6 points below the quotation for the company's first mortgage bonds. The Anglo-Argentine Tramways group is a little firmer after its dullness of last week, but the improvement has not yet found reflection in the prices of its issues. British Columbia Electric Railway stocks remain somewhat depressed.

The telegraph market is quiet, and Westerns are once more

nearly 13. Indo-Europeans have risen to the round 50. Oriental Telephones are harder, and a dramatic rise in Marconis to 43s. 14d. has been one of the features of the week. The buying is said to draw inspiration from knowledge of the Government's intentions with regard to the payments to be made to the company, but this is Stock Exchange gossip. Canadian and American Marconis are both better at 6s. and 16s. 6d.; and part of the buying which has raised these prices came from the United States. Henleys are 5s. up at 14½, and India-Rubber shares at 9½ are similarly better.

The animation in rubber shares goes from strength to strength, and has thrown off for the time being its usual allegiance to the market for the raw material in Mincing Lane. In some Stock Exchange offices, the work thrown upon them by reason of the rubber share activity is taxing physical efforts to their uttermost; and some people are seriously asking whether, the country being at war, the Treasury ought to permit the speculation that is undoubtedly going on. However that may be, rubber companies are prospering amazingly; and the batch of spring reports that will be out within the next few weeks will no doubt take up the tale, already told by recent announcements, of the splendid profits and the big dividends that have accrued during 1915, and which bid fair to be surpassed by those of the current twelvemonth. Copper shares have fallen listless after their spurt; and the pyrotechnical rise in the price of metal, so far from inducing speculation in the shares, tends rather to make prospective buyers cautious of dealing in a market so much at the mercy of American manipulation.

A High-Pressure Plant in Chile.—It was mentioned in this journal three years ago that a German company had received from the Chile Exploration Co. an order for the complete equipment of a power station at Tocopilla, Chile, of a capacity of 60,000 H.P. The power was to be transmitted by three-phase current at a pressure of 110,000 volts to the copper mines at Chuquibambata, where a transforming station for 30,000 H.P. was to be erected in order to yield the direct current necessary for the electrolytic production of copper. The undertaking, which is the first in South America with a pressure as high as mentioned, was to have been completed by the end of 1915, according to the contract. On the outbreak of the war, the greater portion of the plant was on the way in 12 German ships, which were compelled to make their way to the nearest ports in Brazil, Argentina and Chile. After many difficulties, it is stated that it was possible to tranship most of the plant to neutral vessels and convey it to its destination. One of the steamers was obliged to make for Antwerp whence, after the German occupation of that port, the machinery on board was returned to Germany, and it was shipped last year via a neutral port to Chile, after the American interests had succeeded in obtaining a permit from the English Government. Notwithstanding the transport difficulties, it is announced that the installation was brought into operation by the stipulated time—the end of 1915—and is working successfully.

The Petrograd Lighting Co. of 1886.—The fate of the Petrograd Electric Lighting Co. of 1886 has apparently not yet been decided, although the Town Council of Moscow, where the company also owns supply works, is continuing its efforts to bring about a liquidation on the alleged ground that the undertaking is under German control. According to the Swiss newspapers, the new Prime Minister of Russia recently informed the Moscow municipality that in view of the maintenance of customary working under Government supervision, it would be necessary first to prove that the activity of the company was prejudicial to the interests of the State, in order to secure liquidation, as only in this event could the winding-up be undertaken. In Swiss circles, which are large holders of share capital in the company, it is calculated that the dividend on the ordinary shares for 1915 will experience a moderate increase as compared with 1914, when a rate of 8 per cent. was declared, though its distribution was deferred.

BALL BEARINGS FOR ELECTRIC MOTORS.

By T.E.C.H.

AN electrical engineer will generally admit that he is not free from troubles due to faulty bearings, either owing to wear, or because the lubricant is insufficient, or else excessive, in which case trouble results when the lubricant comes in contact with the windings. These difficulties have existed from the earliest times, and, the writer thinks, will always obtain when the ordinary sliding type of bearing is used. The most costly item, and usual cause of in-

FIG. 1.—RADIAL BEARING.

efficiency, is the wear which must occur when surfaces under pressure rub against each other; while the wear is very often reduced by improved methods of lubrication, it cannot, it appears, be altogether removed, and although the cost of a new bearing is small, the damage done by an armature fouling the poles due to wear is very expensive, especially in the largest sizes.

Ball bearings can be considered free from this wear when not overloaded, and are, therefore, of value to the electrical engineer, enabling him to obtain the highest possible bearing efficiency. The following notes are intended to ensure a clearer understanding of such bearings and of the proper mode of mounting them.

Initial Cost.—The initial cost of the motor is reduced because:—(a) The air gap is very materially reduced, which results in a saving of copper; this reduction is not limited by bearing requirements; (b) the over-all length of the motor may be less;

FIG. 2.—RADIAL BEARING, showing races placed eccentrically for assembly.

(Number of balls which can be assembled, small.)

FIG. 3.

FIG. 3.—RADIAL BEARING, showing cut-in races to enable a greater number of balls to be assembled.

repute use a special chrome-steel alloy. Some of the early bearings were made by using a cheap steel, case-hardened, but with heavy loads failure resulted due to the surface of the steel not being supported sufficiently to enable it to offer adequate resistance to penetration or indentation by the balls, the smooth surface of the ball race being destroyed. To enable the surface of the ball path to resist penetration, the balls themselves must not be loaded above that which the ball path will withstand, or in other words, to obtain the highest load-carrying capacity the maximum number of balls must be used.

This requirement has resulted in many designs to obtain the maximum number of balls in a journal bearing of the type shown in fig. 1. Fig. 2 shows the races placed eccentrically, and fig. 3 shows a side recess in the races to enable a greater number to be assembled than is possible by placing the races eccentrically. Fig. 4 shows a later design of bearing, to obtain assembly in which the balls across an

FIG. 5.—RADIAL BEARING, WITH RADIAL SEATING FOR SELF-ALIGNMENT.

opposing diameter of the inner races upon which the balls are held by the cage are taken out; the cage is then passed into the outer race side-ways, and then swivelled across another diameter, and the missing balls are filled in.

Ball Contact.—The steel from which the balls are made will deform when under load, and therefore give a definite area of contact with the races; this should be the maximum possible without any sliding taking place, and also equal upon both races. With the design shown in fig. 1 the contact area of the ball with the outer race is greater than with the inner race, and therefore the stresses caused in the two races are different, for while the stress in the outer race is comparatively small, the stress in the inner

FIG. 6.—MOUNTING OF TOP RADIAL BEARING FOR VERTICAL SHAFT.

(c) the end cover is a very simple casting, since it is not necessary to provide an oil well, which necessitates a complicated pattern and very careful moulding to prevent a large number of wasters being cast.

Design.—To enable the surface of the ball races to resist the stresses imposed by the rolling of the balls when under loads, the steel must have a very close structure and high elastic limit; this is obtained when the races are hardened throughout and then suitably tempered. At the present time most makers of good

race is the maximum. With the design shown in fig. 3 the contact area between the balls and the two races should be the same, and is so when the diameter of the balls and the diameter of the ball path are correct.

Alignment.—For those applications where there is no vibration, and the housing is of heavy design and accurately machined, the bearing shown in fig. 1 has proved very efficient, but where deflections and vibrations occur, it is advisable with this design to use a self-aligning seat or race as shown by fig. 5. This aligning difficulty is not present with the bearing shown in fig. 4, a frictionless self-alignment taking place by means of the balls rolling on the spherical inner surface of the outer race.

Fitting.—The inner race of a radial bearing should generally be a light driving fit on the shaft and held against a shoulder by means of a nut. This method is found efficient and prevents the inner race from creeping. Some makers prefer the inner race to be a heavy driving fit on the shaft and dispense with the nut and shoulder mentioned above, and for this purpose supply slack bearings; although for very small motors, and when great care is taken, this method may not cause trouble, this cannot be said for the large motors. The outer race generally should be a sliding fit in the housing, and no shake should be allowed, though sometimes a light tapping fit gives better results. When the bearings are mounted in a separate housing which is independent of the end cover, a considerable saving is effected when assembling, and grit and dirt are kept away from the bearings when the armature is disassembled for any purpose.

Lubrication.—Ball bearings require lubricating, and the lubricant used must be free from acid and

adjusted itself to the magnetic pull. The bearing which is fixed to keep the shaft in position sideways should be the one which has the least radial load to cope with, and which is nearly always the one furthest from the pulley end.

THE USE OF CONTINUOUS CURRENT FOR TERMINAL AND TRUNK-LINE ELECTRIFICATION.

By N. W. STORER.

(Abstract of paper read before THE INSTITUTION OF ELECTRICAL ENGINEERS, March 16th, 1916.)

(Continued from page 355.)

The use of field control usually involves the use of two additional switches for each motor where switches are used, unless two motors are connected permanently in series, when they can be controlled by the same number of switches as a single motor.

FIG. 7.—MOUNTING OF BOTTOM RADIAL BEARINGS FOR VERTICAL SHAFT.

FIG. 8.—MOUNTING OF RADIAL BEARINGS FOR HORIZONTAL SHAFT.

alkali. Grit and dirt must be excluded from the bearings, and for this purpose felt washers are generally used. Oil-retaining sleeves are used for vertical shafts, as in fig. 6. The demand for reliable motors can only be met when efficient ball bearings are used, made from suitable steel, and to the required degree of accuracy.

Applications.—Fig. 6 shows the top bearing for a vertical shaft mounted in a suitably designed housing, embodying an oil-retaining sleeve. Fig. 7 shows the bottom bearing for the same vertical shaft; a thrust bearing to take the total vertical load is mounted in combination with a radial bearing similar to the one above. It will be noticed that the load passes from the shaft through the sleeve on to the thrust bearing, and does not pass through the inner race of the radial bearing, this being a point which is not always given its due share of attention.

Fig. 8 shows the mountings for a horizontal-shaft motor, the bearings of which are fitted in housings independent of the end cover. It will be noticed that only one of the radial bearings is held sideways to keep the shaft in line; the length of the distance pieces marked A must be taken from the actual machine during the trial run when the armature has

Much the same conditions prevail where the equipments are arranged for regenerative control. Where the motors are to be operated to give regeneration when connected all in parallel, it will be necessary to have a regulating apparatus for each motor, and consequently the additional control apparatus will be very considerable, requiring so much in fact as to make the regenerative control of very doubtful value.

That it is perfectly practicable to operate complicated control systems satisfactorily and reliably is shown by such examples as that of the New York, New Haven and Hartford a.c.-d.c. locomotives, which operate both from an 11,000-volt single-phase trolley and from the under-running 600-volt continuous-current third-rail of the New York Central system. The author has no desire to see that method of operation extended, but the control complications introduced by such an equipment are small compared with what would be involved in operating over three or four continuous-current voltages with full speed on three of them and with several different forms of contact devices.

The problem of supplying the power for auxiliary circuits on equipments receiving power at several different voltages is one of the most troublesome features to be considered, except where only two voltages are encountered, such as 600 and 1,200, which are very common in the United States. For the higher voltages it may be that the use of a storage battery, such as that provided on the 5,000-volt car equipment previously referred to, may prove to be the most satisfactory means. On this equipment a small-capacity storage battery, to which all the auxiliaries are connected, is included in the driving-motor circuit on the car side. The compressor can be so arranged that it will receive probably at least 90

per cent. of its operating current directly from the main circuit without the current passing through the battery, which floats on the line and is thus of comparatively small capacity. This system has the advantage of always maintaining practically the same voltage for the auxiliaries regardless of the voltage on the line.

For locomotive use, where the auxiliaries require considerably greater power, it is quite feasible to use a motor-generator to supply power to the auxiliaries. The motor should be series wound, so as to secure the greater stability due to that type of winding. The great objection to this as well as in the remainder of the equipment to operating on several voltages, is the multiplicity of switches, change-overs, and main and control wiring and other details involved. It soon gets to the point where the ordinary car inspector cannot handle it.

Conclusion.—The logic of this paper points to the necessity for the early standardisation of some of the more important features connected with electrification. The benefits of standardisation would be immediately felt not only in the greater security of the railways in embarking on a project of electrification, but in the decreased cost of all apparatus connected with it.

A good plan would be to secure the fullest co-operation of all concerned, carefully canvass the entire subject, and make definite recommendations for standards. The initiative in such an important matter should be taken by the Institution, which numbers among its members all those who are necessary to decide such questions on their engineering merits. Its own prestige will go far towards making its recommendations into laws, but it would be well to secure the co-operation of all other organisations that are interested. All must approach the subject with an open mind so as to determine as nearly as possible what will be the best for all, and their decision should be accepted as final. Such things as the location of the contact rail for a third-rail system, and of a contact line for overhead systems, could be discussed and settled within a short time; also the question of voltage can be considered and decided before any further railways are electrified or extensions made to existing continuous-current systems.

Since the 600-volt system is so thoroughly established, and also so well suited to the requirements of terminal electrification, it should be continued as one of the standards, at least for the present. While it is probable that but little will be done towards electrification of entire railway systems in the next few years, one other voltage should be selected that will be suitable for such service and will at least serve to direct the aim of those companies about to electrify. This voltage should be high enough to permit the heaviest drafts of power required to be collected from the overhead conductor without exceeding the capacity of a single wire or a single collector, and to reduce the amount of copper in the feeder system to the lowest value consistent with reliable distribution. If the equipments are obliged to operate at full speed on 600 volts, it is practically useless to think of anything higher than 2,400 volts. A still higher voltage should be adopted if continuous current is to be used for trunk-line service with heavy trains.

It is generally conceded that 1,500 volts is about the maximum voltage that can be economically used on the 4-pole railway motor. The type of motor used for the 5,000-volt equipment that has been mentioned previously offers a solution for the problem which makes a very considerable increase in line voltage appear not only possible, but easy in so far as commutation and commutation bars are concerned. The first two motors of this type were tested with 7,000 volts on the line, i.e., 3,500 volts on each motor, with very satisfactory commutation. The limit to the voltage will therefore be found elsewhere than in commutation. The question of insulating motor and control for such high voltages would also appear to be less serious than might have been expected; the sample equipment of four 100-H.P. motors has run over 15,000 miles in commercial service without a single defect in the high-voltage insulation, and the operation of the equipment has been highly satisfactory in every respect.

The author suggests that if possible the "through" lines should be differentiated from the purely suburban lines, and that the best voltage for the former should be adopted regardless of the latter: that an overhead contact wire in addition to the 600-volt third rail be placed over each track that requires full-speed operation for both equipments. While such a scheme has its disadvantages, they are negligible compared with the complication of equipments necessitated by the interchangeable operation on several different voltages.

DISCUSSION IN LONDON.

Mr. C. H. MERZ, who opened the discussion, regretted that the author was not there to take part in the meeting; he had always looked upon him as one of the most original railway engineers in the States, and he had many original ideas, as, for instance, the double armature motor for 5,000-volt direct-current work. Considering its advantages, it was surprising that more use had not been made of regeneration; until recently the only successful example of its use was on the Italian 3-phase railways. He thought there was no example of its use here on stopping services. The use of high voltage should simplify its adoption, because they would already have the dynamotor, which could be used for field excitation. The

author urged them to standardise their electric railway work, and he thought most railwaymen would consider the 600-volt third-rail system as a standard for many years to come, but they must certainly also have a higher voltage if they undertook main line electrification. He did not think it could yet be decided whether the third rail or overhead wire would be adopted in main line work; in the States the long distances necessitated the use of at least 3,000 volts, which meant using the overhead system, and the system adopted in this country would depend on the higher voltage limit. No doubt the 1,200-volt construction used on the L. & Y. Railway would be good enough for 1,500 volts, but that did not seem high enough.

Mr. ROGER SMITH referred to the paper which he had read before the I.E.E. in 1914, in connection with which he had said that no electrical locomotive was in existence which would give 1,100 H.P. at any speed between 30 and 70 miles an hour, as was done by the main line steam locomotives in passenger service. The author, however, mentioned the Pennsylvania D.C. locomotives, which would develop 1,200 H.P. at any speed between 42 and 76 m.p.h., and up to 4,000 H.P. at lower speeds, which he suggested would be better than any steam locomotive. He (the speaker) pointed out that the

CURVES OF DRAW-BAR PULL (STEAM LOCO.) AND TRACTIVE EFFORT AT WHEEL TREADS (ELECTRIC LOCO.), SUBMITTED BY MR. ROGER SMITH.

Pennsylvania locomotive weighed about 145 tons, or twice as much as the steam locomotive, and in using it they had to haul about and pay for a machine which developed 4,000 H.P. in order to get 1,200 H.P. at high speed. For the goods locomotive, the series characteristic was admirable, and looking beyond the suburban service to goods working, field and regenerative control would be very valuable, but would probably involve the use of at least 20 switches for a four motor equipment. We were not in a position to settle the upper voltage limit for railway working. The 1,200-volt protected third rail on the L. & Y. Railway had given great satisfaction, working through the recent snow without a hitch. The snow formed an arch over the slot which preserved the vertical collecting face of the rail from wet, &c. It was important to note that nothing had been done to commit them to any voltage at all; they would have to decide first on the needs of suburban routes, and, later, on those of the main lines, and use equipments suited for use on both systems. There were districts in industrial areas where the tunnels would not admit of overhead wires. A 1,500-volt third rail system would work in well with a 3,000-volt overhead system, but he hoped that the switchgear for use on the two systems would not prove too complicated if used with regenerative and field control.

Mr. LYNALL gave some data of speed range and tractive effort of 600 and 1,500-volt locomotives, from which it appeared that the desired electrical characteristic would not be so easily obtained on high as on low voltage. Referring to the necessity of interchanging electrical rolling stock and locomotives, he said no mention had been made of the Brighton Co.'s single-phase line, and suggested as a climax for future conditions a train equipped for running on two direct-current voltages and a single-phase current of high voltage. Very little information was available as to the extra cost of high-voltage train equipment, and it was a factor in the comparison. No doubt a 3,000-volt equipment would cost substantially more than one for 1,500 volts. He added that they could not decide yet on suitable standard voltages.

* A description of this system appeared in the ELECTRICAL REVIEW of March 24th, 1916, p. 343.

Mr. H. W. FIRTH said he was glad the author's attention had been drawn to the discussions on motor characteristics for railway working which took place at the Institution two years ago, and particularly to the wasteful methods involved. He would like to know whether he was really sanguine as to regenerative control on multiple unit trains; if his surmises as to the future were correct, then considerable economic improvements were in sight. They must do nothing in the matter of line voltage which would stop the interchange of locomotives and trains between different sections of railway. The author's views as to separate voltages would not commend themselves to railway men, as, unless it were possible to separate traffics, it would mean duplicating equipments. Most of the speakers seemed to accept 600 volts as suitable for suburban working, but that tied them practically to 1,200 volts as the upper limit, and it might be necessary to go higher later on. For instance he saw no reason why 1,200 volts should not be adopted for the lower standard, but the time was not ripe for fixing the upper limit.

Dr. S. P. SMITH said the author dealt with the characteristics of the series motor and showed its suitability for certain work, but the position was not quite clear when it came to larger outputs. He was afraid they would not get what they wanted for large locomotive work with field control, and they might have to aim for A.C. motor characteristics. Perhaps the single-phase series motor might solve some of the difficulties outlined by Mr. Roger Smith. He asked what would happen to a motor used continuously as generator (for regeneration) and as a motor for driving, with no opportunity of getting rid of heat, and yet restricted to the present limiting dimensions. American engineers had probably experienced the difficulties of varying voltages and systems, and he understood that the paper had been written as a warning against the use of more than two voltages.

Mr. H. M. SAYERS said that the experimental work on regeneration had been mostly carried out on tramways in this country, and it had resulted in failure. One reason for this had been mentioned—the motor was in use always and had no time for rest. Further, a regenerative motor really required a shunt characteristic, and this was not very suitable for acceleration. But such a motor could be used by introducing between it and the wheel a speed-torque gear of satisfactory construction, and he understood that such a gear was available. This point was worth considering in connection with regenerative control and main line railway problems.

Mr. J. S. PECK, who read the paper in the absence of the author, replied briefly, agreeing that there had not been enough experience to fix standard voltages. He suggested, however, that it would be an advantage to fix some temporary standards on our present knowledge rather than go on on haphazard lines. He briefly outlined the basic method of regeneration, pointing out that many "frills" were being added, and expressed confidence in the ability of the modern motor to stand up to the extra strains due to regenerative working.

DISCUSSION AT NEWCASTLE.

At a meeting of the NEWCASTLE LOCAL SECTION on March 15th, Mr. J. S. PECK, of Manchester, read an abstract of Mr. N. W. STOREN's paper.

Mr. J. R. BEARD thought the field-control system had its disadvantages. The normal condition of the motor was that some of the field was shunted, and that meant that so much of the copper was out of service, and consequently the motor had to be slightly larger to compensate for that. The section of the paper referring to regenerative control was the most interesting one, and on this question much work would be done in the near future; if regenerative control were used they certainly had much greater freedom in regard to the speed at which they braked. Speaking of standardisation of the third rail, he thought it was bound to be left over until they had had sufficient experience of the new third rail on the Lancashire and Yorkshire Railway.

Mr. W. G. GUNS directed the reference to regenerative control as the most interesting in the paper, but said the difficulty was to get a machine that would be suitable for both motor and generator. The difficulty was there overcome by providing additional shunt coils for use while the machine was generating; he thought it would be better to use the same coils.

Mr. C. TURNBULL drew attention to the double-armature motor, and said the difficulty was the question of space; the motors were fitted to inches, and there was room for nothing else. As to regenerative control, he pointed out that the trouble there might be that there were not sufficient cars to absorb the regenerated current, and it would come back on the station. There were cases where the amount of current coming back was greater than that absorbed. Still, he thought the regeneration of energy would do a great deal to bring about the electrification of our lines.

Mr. T. CARTER urged the importance of the question of standardisation, and thought the Institution should take up the point.

Mr. L. H. CARR said with regard to standardisation, that something might be done by the railways in conference, as had been done in part in connection with the third rail.

Mr. PECK briefly replied to the discussion.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

German Silver an Outgrown Superstition.

Mr. Thompson, in the *Journal of the Institution of Electrical Engineers*, sets forth many facts which bear on the use of German silver for resistance coils. The writer considers that any discussion of German silver as a material for resistance coils ought to be relegated along with the discussion of ancient ideas regarding the nature of a magnet. Since electrical engineering began to outgrow the telegraph stage, German silver as a material for resistance coils has been thoroughly discredited, and almost entirely given up. It is probably a fact that any alloy containing zinc is unfit to stand any sort of hard usage, such as exposure to the weather or the heating and cooling with exposure to the air incidental to the work ordinarily put on resistance coils. In the last 20 years alloys have been produced which answer almost every possible need of the electrical engineer for resistance coils. Many of these are of great value, and the roughly well adapted for the particular purpose for which they are designed. These alloys should be better known. Very little experience is enough to indicate what material to use for a particular case. The writer does not know of any single use where German silver could be recommended.

If a definition of German silver should be wanted, here it is: "Brass with a percentage of nickel (very often 10 per cent., but sometimes more or less)."

Charles Wm.

Philadelphia, U.S.A.

Concerning Discounts.

Mr. Fisher's letter mentioning the T.L.A. discount sheet is interesting. He shows that, after getting out a complicated arrangement of discounts, the T.L.A. provide a sheet showing the equivalent simple discount. But why do the T.L.A. not use the simple equivalent discount right away?

We should howl with laughter if someone came from China and told us that the Chinese did business in this way. The whole system reminds one of an incident which is said to have occurred in a certain shipbuilding centre. Some neutral naval officers came across with regard to work being done for them. In the course of their visit they saw through the shipyard and inspected everything in the way of warship work that was being done for our own Navy. Then as they left the harbour they were carefully taken down into their cabins so that they might not see what was happening! Need one add that they were profoundly impressed by our method of preserving secrecy?

The Writer of the Article.

Cause of Flicker.

Confirming the opinion expressed in Mr. Long's letter, I remember about 15 years ago going from Bristol to investigate a flicker on the lights of a large passenger steamer in Southampton Docks. The effect of the flicker on the lights in the saloon was very noticeable when all lights were on. The defect was entirely cleared up by adjusting the valves of the engines.

This occurred so long ago that I have forgotten the name of the boat and even the name of the maker of the engines; but they were vertical engines direct-coupled to the dynamos.

H. Visger.

An Engineer's Wages.

We were interested to note "Experience's" letter in a recent issue of the *Review* under the above heading, and it would appear to us that "Experience" is one of the many disappointed men who, after the completion of their college training, are unable to obtain remunerative employment.

If "Experience" has not yet been able to solve his difficulties, we should recommend him to adopt the course which many men have found to be inevitable, and obtain a position as an apprentice in one of the many large engineering works, which would carry with it a remuneration of seven or eight shillings per week, experience, and plenty of hard work. After the completion of his apprenticeship "Experience" may possibly be surprised to find that he is then able to meet his landlady's account with his own earnings.

Two-Phase.

Manchester, March 21st, 1916.

[Our two correspondents are quite right; a graduate from no matter what college has no claim to the title of engineer, and no right to expect an appointment in any such capacity, for there is one element in the training of an engineer which cannot be imparted by any teaching institution—*experience*. If our correspondent who, with unconscious irony, used that pseudonym, has been led to believe that when he has passed through his college course he is an engineer, he is the victim of a cruel deception.—Eds. *Elec. Rev.*]

The Engineer in the Tropics.

In an article headed "The Engineer in the Tropics" in your issue of the 17th inst., the author makes at least one mistake. Towards the end of the article he says that "in India, Africa, and Malay States, white patrol jackets buttoned up to the chin are usually worn." Whether he is right about Africa and the Malay States I do not know, but in India certainly one seldom comes across this style of "get-up," except among the lower classes of Europeans (and then seldom) or travellers from "further East." Jackets cut to the same pattern as one's home clothes are *de rigueur*, and in the more civilised parts, e.g., Calcutta, Bombay, &c., they must not be white, although the trousers may be. The coats should be either of light "holland" material, silk, or flannel, and the latter being slightly yellow provides the necessary contrast with the trousers. The trousers may be of the same material as the jacket, unless the latter is flannel. It is a small matter, but may as well be correct if mentioned at all. It is always best to buy clothes on arrival in the Tropics, and not at home, as then one gets the correct things for local wear. A man fitted out by a "colonial outfitter" is usually a source of amusement to everybody but himself. All he need take from home is a sun helmet and ordinary summer clothes.

The author of the article also recommends corrosive sublimate for wounds and scratches. It is true that this extremely poisonous substance cures "prickly heat" very quickly, but it has to be applied in very weak solution, and even then the result is usually very bad boils, due, presumably, to absorption of the poison into the system. Personally, I have given up this "cure," as I prefer the "prickly heat" to the boils. In any case, I have been advised by doctors that on no account must corrosive sublimate be used on or near open cuts or scratches, and chemists usually give the same warning. I am unable, therefore, to understand the recommendation in the article in question, and I certainly think a warning is necessary, although I profess no medical knowledge myself.

"Koie Hai."

Wiring Problems.

Appropos of the new wiring rules issued by the Institution of Electrical Engineers, where would you find a ruling for the following claims which were put to us in one day:—

No. 1. We tendered for the cabling in connection with a 15-H.P. motor, and in our specification we stated exactly the size and quality of the wires to be used. The cabling provided for nearly 25 per cent. overload, but the customer claimed that it did not comply with the rules, as his machine would give an overload of 50 per cent. for half an hour and 100 per cent. momentarily.

No. 2.—We were instructed to join up a 20-H.P. motor, but as the motor was only doing about 2 H.P. we were requested to provide for that load only.

Needless to say, we have settled both these matters satisfactorily to ourselves and the customers, but other views would be interesting.

L. E. Wilson.

Manchester, March 24th, 1916.

The B.O.E. and the C. & G.

Your journal is read by many students who will presently be answering examination questions on electrical engineering; and some of them now understand the serious inaccuracy of the old rule for getting greatest current from a battery, which is still obstinately adhered to by professors connected with the Board of Education and the City and Guilds of London Institute. These candidates may be wondering whether they would run any risk of losing marks if they employed my rule, and thereby got a correct answer that the examiners were not expecting; for both these institutions have either been giving full marks for wrong answers, or setting questions that are all specially suited for a rule that is known to be bad. You will, therefore, perhaps allow me to show the following way out of the difficulty.

Suppose the candidate is asked what arrangement of 20 1-volt and 1-ohm cells will send the greatest current through an external resistance of 13 ohms. With 10 in series and 2 in parallel the resistance of the battery would be 5 ohms; and with all in series it would be 20 ohms. Therefore, the greater of these resistances being the nearer to that of the external circuit, the old rule would tell him to put the cells all in series; and he should give this answer without any comment; for the old rule will always be right when it indicates an arrangement with more resistance than the external circuit.

But now, suppose that the external resistance had been 12 ohms, which is nearer to the smaller of the above two battery resistances. Here the old rule would tell him to put 10 in series, which would give a current of $10/(5+12)=10/17$; whereas my rule would tell him to put all in series, which would give a current of $20/(20+12)=10/16$, evidently an increase of exactly 62 per cent. (I have chosen a number of cells that is particularly favourable for the old rule; otherwise my rule might have given an increase of 20 per cent., 100 per cent., or anything you please.) Here the candidate should say something to the effect that when the external resistance is be-

tween two consecutive battery resistances and nearer to the smaller one, both of them should be tried; and he should then show that the greater current is obtained with all the cells in series. So long as he takes care not to mention my name or my pamphlet, I do not think it will be necessary for him to give a wrong answer in order to get full marks.

W. F. Dunton.

Newcastle-on-Tyne, March 27th, 1916.

[Mr. Dunton is aware that we regard the grouping of cells as of little importance in practice; but his letter raises a totally different and very serious question, for he suggests that the examiners of these two great educational authorities have been deliberately "loading the dice." That Mr. Dunton's argument with regard to the "old rule" is correct is indisputable; we feel sure, however, that the examiners, if they have erred, have done so through inadvertence and not of set purpose.—EDS. ELEC. REV.]

THE RÖNTGEN SOCIETY.

At the March meeting of the Röntgen Society, held at the Institution of Electrical Engineers, the discussion on the protection of the X-ray operator, adjourned from the previous meeting, was resumed.

Dr. W. HARWOOD NUTT said that several X-ray workers complained of headache and sleepiness after a short time in the X-ray room. In his opinion this was due, not to the ionisation of the atmosphere, but to the generation of ozone, and some experiments he had conducted showed that ozone was actually produced in the neighbourhood of the tube.

Mr. W. A. SCHALL put in a mild plea for the manufacturers of X-ray apparatus. He had no doubt that there was room for improvement, but until the manufacturer was definitely told what he must guard against he was in a difficult position. The manufacturer did not yet know what the medical man wanted. One authority would say that a covering of 2 mm. of 4.5 lead rubber was amply sufficient as a protection; another that it was not nearly enough. They had yet to find out what thickness of lead rubber was equal in opacity to the human tissue.

Dr. G. B. BATTEN referred to the enhanced danger of those X-ray workers who, in addition to working with the tube, had to do with chemical substances, such as developing agents. These would often precipitate an X-ray reaction which otherwise would have remained latent.

Major WILSON, of the Canadian Medical Service, said that the ideas of British manufacturers on the subject of X-ray protection were certainly below the standard which was deemed necessary with the heavy transformer outfits obtained from the United States and Canada. He believed, with a previous speaker, that the tired feeling was due to ozone, no matter whether generated from the terminals of the tube or those of the transformer itself.

Mr. T. CLARKE made the surprising statement that he had worked for 20 years at X-rays without any protection whatever, and had never received any injury. He had employed a static machine, and in his opinion X-rays from a tube excited by a static machine were comparatively harmless, and were different in nature from those given by a tube excited by an induction coil.

Upon this point, Dr. SIDNEY RUSS, in replying on the discussion, said that there was no reason why, if the potential difference between the electrodes was the same, there should not be identity between the rays thus differently produced.

The President of the Society, Mr. J. H. GARDINER, announced that the authorities of the National Physical Laboratory were prepared to examine and give a certificate upon protective materials which would enable both manufacturers and users of materials to know the absorption coefficient of the protective devices they supplied and used. He also stated that the Council of the Society had under consideration resolutions on the subject of the efficiency of X-ray apparatus from the point of view of safety, which would be submitted to the War Office and Admiralty.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

SWEDEN.—The exportation of the following among other articles, has been prohibited from Sweden:

As from February 8th. Driving and transmission belts of leather, rubber, gutta-percha or balata, even in combination with other materials.

As from March 1st.—Boots and shoes of tissue, with rubber soles; tungsten wire.

RUSSIA.—In virtue of an Imperial Decree, dated January 7th, the Russian Minister of Finance, in conjunction with the Minister of Commerce, has been empowered temporarily, until the close of the war, to diminish or increase, in accordance with local conditions, the period fixed for the payment of Customs duties on goods (including postal parcels) received at Customs establishments, to issue regulations with regard to the warehousing of the same, and to determine the procedure and periods of sale of these goods, in cases of non-payment of the Customs or other duties.

FRANCE.—Owing to the inaccurate declaration of British goods imported into France, several cases of difficulties with the French Customs authorities have recently been brought to the notice of H.M. Consul-General in Paris, with a request from the firms concerned that an appeal against the fine imposed by the French authorities should be made through his intermediary. The Consul-General states that, in such cases, the inaccuracies are usually ascribed to inadvertence, and adds that, as a general rule, no satisfaction is to be obtained on this ground from the Customs authorities. He therefore calls attention to the necessity of furnishing full and accurate information to the person charged with the declaration of the goods to the French Customs, in order that the consignments may be correctly declared and trouble with the Customs authorities avoided.

The following note of some of the requirements of the Customs Regulations may be useful:—

Declarations must be presented in duplicate on printed forms in conformity with the approved model; they must indicate the nature, kind, and quality of the goods, the place whence imported, and their destination. In addition, the weight, or the measurement or number, or the value, of the goods must be shown according to whether the duty is leviable on the weight, measurement or number, or on the value. The marks and numbers of the bales, cases, casks, &c., are to be shown in the margins of the declarations, and if the origin of the goods or any other special circumstance entitles them to favourable tariff treatment, the fact must be stated.

AUSTRALIA.—An Australian Proclamation, dated December 22nd, prohibits the importation into the Commonwealth of electric or magnetic belts, or any belt, or any article of wearing apparel, or article for toilet use, or any appliance which is alleged or intended to produce a therapeutic effect by electric or magnetic influences, or by the presence of radio-active elements.

UNITED STATES OF AMERICA.—According to a decision recently given by the United States Board of Appraisers, wireless apparatus imported for use upon vessels owned by the United States or operated under American registry, when entered and installed under the prescribed conditions, is free of duty on importation into the United States.

SOUTH AFRICA.—The following Customs decision has recently been officially announced in the Union of South Africa:—

Washing machines driven by electrical power are dutiable under No. 193 of the Tariff at the general rate of 20 per cent. *ad val.*, the rebate allowed on goods manufactured in the United Kingdom or reciprocating British Colonies being 3 per cent. *ad val.*

NORWAY.—The exportation from Norway has been prohibited of copper oxide and copper peroxide, also of all manufactures of rubber, balata and gutta-percha (with the exception of driving and transmission belts of balata and gutta-percha).

EGYPT.—Revised tariff valuations for use in assessing duties on certain metals imported into Egypt have been issued, with effect from February 1st to March 31st, 1916, or until denunciation, as follows:—

	Valuation per kilog. Millièmes.
Copper and brass sheets round and bottoms	136
Copper sheets, plain	135
Copper sheets in rolls, bars, round and flat	133
Copper ingots	130
Copper wire	<i>ad valorem.</i>
Brass wire	"
Brass sheets, plain, 24 by 48, 8 lb. to 5 lb. ...	"
Tin ingots and bolts	185
Lead sheets	38
Lead shot	39
Lead pipe	38
Lead, pig	38
Zinc sheets	117
Zinc ingots	117
Phosphor bronze	117
Antimony	130
Onik-silver	600

Duty is leviable on the valuations shown at the rate of 8 per cent. (1,000 millièmes). £17 = £1 0s. 6d.

THE ELECTRICAL REVIEW.

Published every FRIDAY, Price 4d.

The Oldest Weekly Electrical Paper. Established 1872.

TO BE OBTAINED BY ORDER FROM ANY NEWSAGENT IN TOWN OR COUNTRY.

OFFICE 1-4, LUDGATE HILL, LONDON, E.C.

Telegraphic Address: "AGEERAY, LONDON." Code, A B C.

Telephone Nos.: City 997; Central 4435 (Editorial only).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the largest circulation of any Electrical Industrial Paper in Great Britain.

Subscription Rates.—Per annum, postage inclusive, in Great Britain, £1 1s. 6d.; Canada, £1 3s. 10d. (\$5.80). To all other countries, £1 10s.

FOREIGN AGENTS:

ADLAIDE: Messrs. Atkinson & Co., Gresham Street.

AUCKLAND: N.Z.: Gordon & Gotch, Albert Street; The Mining and Engineering Review, 31a, Strand Arcade, Queen Street.

(J. A. Berly's).

1916 EDITION

READY.

H. ALABASTER, GATEHOUSE & CO.,
4, Ludgate Hill, London, E.C.

FROM the observations which appeared in our issue of January 21st, under the title "National Business Organisation," it will have been gathered that we viewed with regret the division of the different forces which were engaged in endeavouring to form a powerful national industrial organisation. There were several separate movements on foot, each of them was fairly strongly backed by important industrial interests, all of them were making headway in their own circle or sphere, and the objects in view were, in the main, very similar. Was it desirable, when there was a practically universal recognition that a truly national organisation of impressive proportions and effective strength was one of the greatest industrial needs of the times, that these groups should continue their efforts independently? If want of co-operation among industrial interests had been a weakness in the past, why perpetuate the error by a division of the very forces which were aiming to remedy it? The air has been thick with new schemes and proposals of one kind and another all the while we have been at war, and their existence, the interest that they have evoked, and the support that they have received, have proved beyond doubt the desire of industry to concentrate its forces.

Probably all of these schemes have contributed some assistance in stimulating interest in the idea of associated and co-ordinated policy, but three of them stand out more prominently than the rest as demanding serious attention when the time is ripe for seeing whether an amalgamation of forces can be effected. The Institute of Industry is one; the second is a substantial organisation started in the Midlands by Mr. Dudley Docker; and the third is the Manchester scheme set on foot by Sir Charles Macara. With the first we have dealt pretty fully on several occasions; its little plaster exhibition building overlooking the Strand still stands as a monument to its earlier memory, though fast crumbling to decay, like some of its earlier ambitions. Our readers will have noted that we never have been able to treat this movement as being seriously representative of the great industries of the country; it has not been founded or engineered in a manner which called forth either our respect or our admiration. When, therefore, we were invited to take tea with the Court of Directors last week, on the occasion of the making of an "important announcement," the object of the gathering being "The creation of a national organisation adequately representing British industrial interests," we attended with some curiosity, little enthusiasm, and only just a slight modicum of hope. As the proceedings developed, however, our curiosity developed into a deep interest, and our enthusiasm and our hope both rose very high. We are in doubt as to which was the "important announcement," for there were several. One was to the effect that the Institute of Industry was willing to sacrifice its name; the other that any director would retire in order to strengthen the Association; and last, but not least, Mr. J. Taylor Peddie had placed his resignation in the hands of the directors, so that they might offer to those who wished to join forces with them the advantages of a central association free and unfettered by any existing agreement as to management. So be it! Mr. Nettlefold, in his control of the proceedings, impressed us with his unquestionable sincerity. He gave us clearly to understand that the Institute of Industry, as we have known it, is willing to sacrifice itself in order that there may be that consolidation of national resources which is a vital necessity.

The way was thus opened for valuable discussion, and as representatives of the two important groups which have made no inconsiderable headway (Mr. Dudley Docker stated that his movement was supported by from 30 to 40 firms who were each willing to put down £1,000 apiece) were present, it was possible for practical suggestions to be advanced. Mr. Docker proposed that a conference should be held between the Institute of Industry, the Association with which he was concerned, and the Manchester group, and he expressed the opinion that from such a conference there might emerge a big association, which even the British Government would have to recognise. He suggested that they should all "come under one umbrella" (we think he meant a new one) in order to co-operate efficiently. We are pleased to state that the proposition was accepted by the chairman on behalf of the Institute; it was approved by Mr. F. R. Davenport, who, as a director of the Manchester movement, said he would recommend it to the Manchester group; and it was supported by Mr. A. W. Tait, who is not disinterested in electrical and financial affairs. We believe that the conference actually took place within a few hours after the suggestion was made, and we shall hope to hear in due course that an entirely new and central organisation will be speedily established, forming an "umbrella" which shall shelter all our national industries from the cold water of the politicians whom Mr. Dudley Docker and not a few others abominate.

Two of the principal essentials for such an organisation are, as Mr. Tait remarked, brains and money—both are required in the best quality and the largest quantity. We asked a couple of months ago whether it was suggested that industrial firms should pay their usual trade association subscriptions and find funds for the new institute or association as well. Mr. Docker's efforts have proved that, when once it is realised that a truly great organisation is in prospect, funds will flow in freely. Hundreds of associations which are in existence will doubtless desire to link up to such a body, because they will expect it to exert in combination such a powerful influence in matters of prime concern as individually or in smaller groups they could never hope to exert. Hundreds of wealthy industrial companies and firms would also be prepared substantially to support movements which are going to assist them in the expansion of their operations.

The matter of finance in such an organisation is an interesting one. Mr. Allcock, of Manchester, advanced a suggestion which is deserving of careful consideration. He urged that in their thought of, and regard for, great ideals, they should not overlook the fact that there were many sectional associations which were doing very useful work. The money for a new association might be obtained by linking these all up together. At present most of them intermix idealistic and practical efforts. A transfer of the idealistic duties from each of the national organisations might induce those sectional associations to contribute a percentage of their income (say 10 per cent.) to the national body, which, by its constitution and objects, would cover all those matters concerned with what may be termed national policy in relation to industry. The remainder of their incomes they would continue to expend upon the aforesaid useful practical work. He mentioned, to illustrate his suggestion, the willingness with which a firm of, say, engine-makers, would subscribe to the funds of their own association if they were convinced that a better market for their engines would be secured; but they would be averse to subscribing to funds which had ideals as their aim. This is, perhaps, a point of detail which may well be left to the judgment of the court of directors of the new association or federation, or whatever it may be called, but we repeat that it is well worthy of consideration if for no other reason than that it would permit existing associations to leave undone some things that at present absorb a good deal of their attention, and allow them to increase their own usefulness to the trades that they represent by concentrating on work of really practical value.

The Institute of Industry, it will be remembered, dropped "science" from its title. It may be that the new Federation of British Industries will find that it can consolidate its forces in the most profitable manner by going a step

further. It may recognise that it will be unnecessary for it in any way to overlap the operations that are likely to ensue from the national organisation of science which is being proceeded with by the Royal Society. A great and effective scientific organisation of this character can render service to science, and those who affect it as a calling, by linking up all the scientific societies and institutions for combined effort in the national interests. And if beside this there were a great Federation of British Industries, there would be available two essential parts of one grand organisation which would strengthen our prestige and position throughout the world. This is surely an object for which all should labour, and if for its fruition the spirit of self-sacrifice has to be exercised—as we believe it must be—we are sure that no founder, and no Institute, will be permitted to remain as an obstruction in the path. It is useless shutting our eyes to the fact that certain of those who have a substantial stake in some of the present movements will require such a sacrifice. The chairman most gracefully and appropriately signified by his announcements that such an eventuality had been foreseen, and we believe that he and his court of directors will, as a result of conference and mature deliberation, come to the conclusion that it must be made.

The I.E.E. and its Council.

THE Council's nominations for the vacancies which will occur in the offices of president, vice-presidents, honorary treasurer, and ordinary members of Council, on September 30th next, are now in the hands of members. The task of commenting upon this document is one of considerable difficulty, since it is regrettably easy to be suspected of invidiousness when any names are mentioned. We may, therefore, begin by saying whatever we can that is favourable, just to show that we are not content with expressing dissatisfaction only.

The addition of Mr. Chattock to the body of vice-presidents will, we think, be welcomed by everyone, especially in the great industrial district of which Birmingham is the centre, and in which the heads of lesser concerns affectionately allude to him as "The Chief."

With respect to the ordinary members of Council, we must observe that it does not appear to be at all representative of the large manufacturing concerns of the country. How are we to look for that co-operation and that co-ordination of interests which are so much talked of unless representatives of all these interests are included?

The central-station engineers were at one time conspicuous by their absence from the Council, but we saw the somewhat violent advent of Mr. H. F. Proctor, and now we see upon it Mr. Chamen, Mr. Chattock, Mr. Christie, Mr. Dickinson, Mr. Highfield, and Mr. Woodhouse, to mention only those who are now members.

Certain sides of the manufacturing industry are fairly well represented, and we welcome the nomination of Mr. Nisbett, who will not only tend to preserve the continuity of the Council with its predecessors, but whose firm is embarking upon more than cable-making, and so becoming somewhat more representative of manufacturing in general.

It is, however, with regard to the presidency that we must sound a note of warning.

Dr. Ferranti was made president, amid universal acclamation, for a second successive year, he being the first president to be honoured in this way. We all had hopes at that time of the carrying into practice of a certain "broader policy," and that we might go forward under gallant leadership to a conquest of industry by electricity and to a conquest of electricity by the British race. That these hopes proved largely illusory was hardly the fault of Dr. Ferranti.

Mr. Duddell's eminent services to electrical science had their natural result in a second year for

him. We refrained from expressing any views on the question at the time of his re-election, for, as will be remembered, there was something of a set made against him, with which we did not desire to be identified. Sir John Snell did not occupy the chair for a second year, and we then hoped we had broken away from the new practice before it had become a custom.

We are sure that we shall not be accused of any feeling adverse to Mr. Sparks, when we say that we unfeignedly regret that it is proposed to elect him to the chair for a second year. We welcomed his accession to that dignity; we have admired his occupancy of the chair; his popularity is as unquestionable as it is well-deserved. We feel, however, that there are so many excellent men on the Council, whose arrival at the head of the profession is delayed by the course proposed, that it is our duty to protest against it.

We sincerely trust the practice will not become customary with the Institution. The gain, if any, to be obtained by the holding of the presidency for two successive years by any member, however distinguished, is not obvious, and it makes the pace too slow for those behind.

Cross-talk. THAT technical phrases which are perfectly intelligible to technical men should nevertheless present perplexing problems to lawyers is not a matter for surprise, least of all when they relate to such abstruse phenomena as electrostatic and electromagnetic induction, which have no parallel in the experience of the layman; but it is a matter of considerable importance when it affects the construction of a specification or the performance of an installation, and this was well exemplified in a case which was heard recently at the Salford Hundred Court of Record. In this case the plaintiffs, Messrs. Pearson's (Electricians), Ltd., a Manchester firm of electrical contractors, sued for a balance of account due for an intercommunication telephone installation which was guaranteed against "cross-talk." The defendants claimed that the installation did not comply with the specification, inasmuch as conversations could be overheard by departments which had not been called; the instruments and cable were of the double-line type, and were properly installed, so that inductive effects were eliminated, but the defendants claimed that a secret service was required and promised, and thus the case depended entirely upon the definition of "cross-talk."

The managing director of the plaintiff company, a representative of the General Electric Co., Ltd., and Mr. L. E. Wilson, A.M.I.E.E., were called on behalf of the plaintiffs, and in response to a request of the judge for a clear definition, "cross-talk" was defined as "electric energy conveyed through space and not by contact or connection." A representative of Messrs. Siemens Bros. & Co., Ltd., who was called for the defendants, agreed with this definition, and therefore judgment followed for the plaintiffs.

Those who were concerned with the installation of intercommunication telephones in the last decade, when single-line circuits were in general use, will remember that as the number of stations increased the trouble from cross-talk became acute on any busy system, and in 1909 Mr. L. E. Wilson, in a short paper on "Telephones" which he read before the Manchester Local Section of the I.E.E., pointed out that while cheapness was thus attained, the consequence was the production of cross-talk, which depreciated the value of the system generally; he went on to point out that cross-talk was directly proportional to the potential of the line. Mr. K. B. Miller also, in his "American Telephone Practice," stated that when one circuit acted inductively on another so that conversations on one could be heard on the other, the phenomenon was termed "cross-talk," and was

attributed chiefly to electromagnetic induction. Counsel for defendants endeavoured to show that the badinage of two comedians talking at one another was known as "cross-talk," with what relevance we are unable to imagine.

The moral to be drawn from this case is that manufacturers in their catalogues, and contractors in their tenders, should make it clearly understood that immunity from cross-talk does not mean that a line when in use cannot be tapped by a third party, or that a secret service is to be provided; such secret service can, of course, be given, at a price, but is not contemplated in the ordinary intercommunication installations. Even when the double-line system is installed, cross-talk may still be present if the combination is not properly connected up. Expert opinion is adverse to the use of single lines beyond ten stations, though unfortunately contractors are to be found who would not hesitate to go to thirty lines.

Electrical Trade in Australia.

IN view of the new situation that is arising in the Australian Commonwealth in consequence of the very thorough policy adopted by the Government for limiting the activities of German and Australian traders there both during and after the war, we took advantage of the opportunity presented by the presence in this country of Mr. G. T. Milne, H.M. Trade Commissioner for Australia, to interview that gentleman on the present position and the outlook electrically. It is, of course, of the first importance that British firms who are anxious to open up new business connections in that part of the world should closely analyse the statistics of Australian import trade, so that they may see what proportion of the trade in their particular lines is already in British hands. In some sections of the industry we have a substantial hold on the trade that is going, but the conditions are likely to be so much more favourable to our manufacturers in all lines henceforth that the proportion that has gone to enemy traders in the past will be ours if we are able to tackle the business in the right way; in addition, there will also always be new development work in progress. These two possibilities should afford considerable scope for British activity without rendering competition between British firms unduly keen. From our conversation with Mr. Milne respecting the outlook, we judge that he holds the conviction that Australia is a very fine field for the sale of electrical machinery, fittings, and appliances. The uses of electricity are rapidly extending there as everywhere else, and they will continue to do so, but so far as the British manufacturer is concerned, Mr. Milne emphasises the point that when dealing with public bodies in particular, it is impossible to do business without proper local representation. A new firm entering the field cannot expect to do business unless it has a live representative on the spot, and the best course to adopt before appointing such is to send out a responsible representative who knows the electrical trade thoroughly, especially on its commercial side, to make a survey of the whole field and see whether that field justifies the opening of a branch or merely the appointment of agents. Perhaps a number of our firms will undertake such surveys on co-operative lines?

American and Japanese competition is a factor to be reckoned with. During the war there has been a development of Japanese manufacturing activity—Japanese electric lamps, switches, insulators, glass, etc., and even complete installations, are on offer. Whereas Germany formerly took large orders for insulators on account of price, there is now local manufacturing in this department as well as Japanese tendering. Japanese travellers have been on the ground recently, and their activities are not likely

to be reduced at present. The policy of the Commonwealth Government is, of course, to support local manufacturers first of all, British manufacturers next, and our Allies will naturally follow closely thereafter in respect of any preferential treatment. Nobody can tell at present what is to be the upshot of trade affairs in the Australian market, save that the German trader is not likely easily to get a look in. It may be predicted with reasonable confidence, however, that the spirited and thorough policy that has been applied in respect of the metal industries will bring local industrial changes, and one of these will involve the drawing of copper wire in Australia. Representatives going out from England are advised to study on the spot this question of local industries in its bearing upon their own contemplated schemes for opening out branches. Viewing our trade with the Commonwealth as a whole, we are assured that where matters have gone against us in the past it has frequently been due not to high prices, but to failure to give delivery up to time.

Lead. THERE has not been much change in the general position of pig lead lately, although the price rose considerably further up to about £36 10s., a new high record, notwithstanding the recent Government prohibition of speculative dealings. Under the new regulation, pig lead is, of course, no longer a free market, so that the present state of comparative scarcity is having, if anything, the more effect upon the trend of prices whenever the demand assumes some importance. The view, at any rate, is generally expressed by dealers that the authorities would have been wiser by not interfering with the market. Offers of distant metal are now generally held back and consumers find more difficulty to "hedge in" against their forward requirements. Transactions are chiefly confined to prompt and near shipments, which tends to narrow down the range of values. The price of foreign lead now stands near £34 15s. usual London terms ex ship Thames, which is not much less than 100 per cent. above the normal figure in peace times, but so far as can be gathered, there is not room for a big fall in the price until the quantities diverted to this country are more commensurate with the size of the abnormally heavy current requirements, chiefly in connection with munition work. There is no indication of an improvement in the latter direction, for the present at any rate, while the situation is aggravated by a multitude of adverse circumstances. The chief of these is undoubtedly the pronounced spell of stringency which has been developing across the Atlantic, where values have been raised to a level equal to something like £40 a ton, which virtually precludes the possibility of contracts being arranged for shipment to this side.

There is now apparently a ready demand in America for all the metal which is being turned out in order to provide for the much larger domestic needs, while outstanding contracts have yet to be met for export, partly to Japan. The American position is now affected by the utterly paralyzed state of the mining industry of Mexico. Operations at the American Smelting and Refining Company's plants in Mexico have been entirely stopped, and there is no prospect of early resumption of working there.

As regards the European situation, indications do not hold out much hope of relief. Mining operations in Spain still leave much to be desired after the recent labour troubles, producers being severely handicapped by fuel scarcity and abnormally high costs. A large portion of the Spanish production has been for some time past finding its way direct to France, so that the quantities coming to this side continue small. A fair average tonnage is coming forth from Australia, but the arrivals continue considerably short of last year, and it is to be feared that market conditions will continue pretty tight over the next few months.

SHERRY'S SAWMILL AND TIMBER WORKS.

THE saw mills and timber conversion and treating works, which are illustrated herewith, have been constructed and equipped for Mr. Sherry, at Homerton Bridge, Homerton, from the designs and under the superintendence of Mr. W. Worby Beaumont, M.Inst.C.E., M.I.E.E.

Mr. Sherry has another saw mill at Old Ford, and some time ago he contemplated remodelling that mill as to its power plant and as to its timber seasoning department; but on this he was advised, and finally decided to erect entirely new works at Homerton.

The Old Ford works were supplied with power from suction gas plant and some electric motors, and, on advice, it was intended to install a modern steam plant in the place of the suction gas engine. The engine, however, which was designed to comply with the circumstances of the old works, has instead been erected in the new works at Homerton.

These new works are of particular interest because of the remarkable economy which has been effected in the cost of power. They are situated on the Lea Navigation, on land which had been waste until recent times; the site has been leased from the London County Council, which authority has a large area thereabouts still unused.

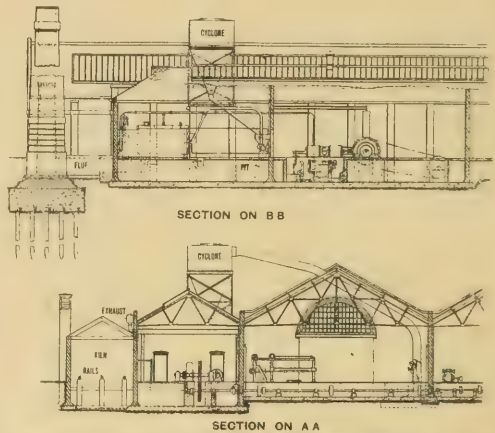

FIG. 1.—LONGITUDINAL AND TRANSVERSE SECTIONS OF THE SAWMILLS (see fig. 2).

Mr. Sherry imports timber of various kinds on a large scale, and prepares it for the various prepared-timber users, especially the furniture and joinery trades. The preparation of the various woods, chiefly in the form of surfaced boards, light scantling stuff, and mouldings, produces a large quantity of sawdust and shavings, especially the short shavings from surfacing and moulding machines. About 26 tons of this sawdust and fine shavings was produced per week; a considerable quantity was formerly used for horse bedding, for which it was sold at a nominal price, but most of it is now used for power production by combustion in high-pressure superheated-steam generators, supplying steam to a compound condensing engine.

The general plan of the works is shown by fig. 2, whilst fig. 1 gives longitudinal and transverse sections of the mills. The sub-soil of the land on which the mills are built is a very varied composition of mud, silt, bog, gravel, clay, and shifting sand, and special precautions had to be observed in preparation for making foundations, especially in the case of the chimney.

All the foundations for the mill building and engine room are of wide-base concrete, heavily reinforced with strong expanded metal. Piling and heavy timber work had to be resorted to for the chimney

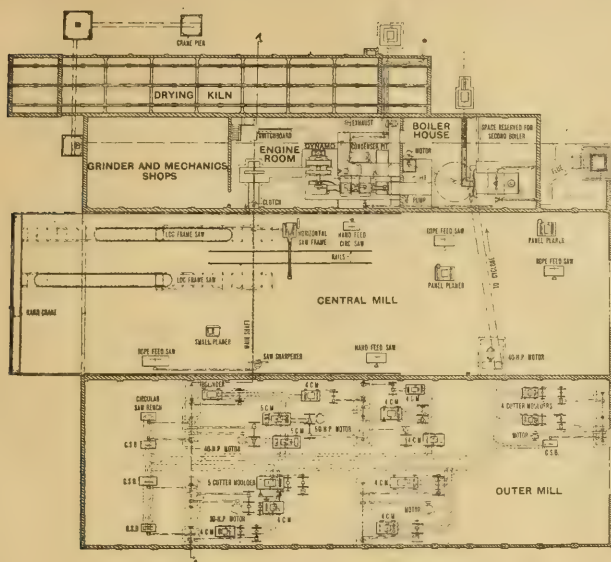

FIG. 2.—GENERAL PLAN OF SHERRY'S SAWMILLS.

foundation, which cut through into water-logged substrata below the level bed of the adjacent Lea navigation.

Adopting the experience and practice gained at other works by the same designer, the mill machinery is in part driven by direct rope drive to main shafting, and partly by electric motors to separate machines, or groups of machines, supplied with current from a continuous-current generator on the engine shaft.

The general plan, fig. 2, shows the two large mills, engine and boiler house, the gluing-up shop, and, alongside of the engine house, the drying kiln, which is about 30 ft. from the Lea Navigation Canal. A long jib crane commands the barges in the canal and the east end of the drying kiln, and the timber yard east of it. In the central mill there are several log frame saws, two of which are shown in position, and a number of other machines. In this same mill is the large exhausting fan, by which all the sawdust and surfacing-machine shavings are collected from the outer mill and delivered by a trunk 2½ ft. in diameter, as shown, into a large separator erected above the boiler house, from which they pass into a refuse pit therein. The positions of the present boiler and space for a second boiler (which is about to be installed), feed pumps, steam pipes, etc., are shown in the same plan, and in the adjoining engine room are seen the engine, dynamo, rope drive to main shaft in the central mill, switchboard, etc. The relative positions of these parts of the plant are further shown in the two sectional elevations taken on lines AA and BB of the plan.

The engine is of the tandem

compound Paxman-Lenz type, with cylinders of 12 in. diameter and 21 in. stroke; the air pump is worked from the tail rod of the low-pressure cylinder. The engine works with steam at a pressure of 160 lb., superheated 200 deg. F., and runs at 200 R.P.M. The surface condenser arranged in the basement as shown is of large capacity, having in view the introduction of further steam and electric power. By arrangement with the Lea Conservancy, circulating water is taken from the Lea Canal and returned thereto, and blow-off water from the boiler also finds its way into the canal from an interception pit.

Though not shown in the drawings, there is a large oil separator, as well as a steam separator and oil pumps, in the condenser pit. The boiler is of the Economic type, 14 ft. in length and 8 ft. 7 in. in diameter, with two furnaces specially arranged for firing with continuous air and refuse fuel supply from the cyclone separator, as before mentioned. The sawdust

FIG. 3.—CENTRAL MILL, SHOWING LOG FRAME SAWS.

FIG. 4.—OUTER MILL, SHOWING AIR-DUCTS FOR COLLECTING REFUSE

and other refuse falls into the pit shown in the general plan, from which it is raised by an electric fan and delivered directly into the furnaces, the proportions of air and refuse being adjustable to the best relative values for complete combustion. Steam is taken from the superheater at the back of the combustion chamber.

The continuous-current generator on the engine shaft is of the General Electric Co.'s compound multipolar type, fitted with interpoles, and capable of an output of 160 kw. at 460 volts, as well as 25 per cent. overload for two hours, or 50 per cent. overload for an hour and a half.

FIG. 5.—CYCLONE SEPARATOR.

Since the plant was tested on the completion of the works, a great deal of machinery has been added, but the following figures show that, with the load that existed at the time of testing, very remarkable economy was realised. When the original estimates were prepared with respect to fuel costs in Mr. Sherry's old works, which were then intended to be remodelled, and subsequently for these new mills, particular consideration was given to the type of refuse, which consisted chiefly, as mentioned, of sawdust and the short, small shavings of surfacing and moulding machines, and Mr. Sherry was promised that the new plant should give him all the power

the mill. In the result, however, no coke has ever been required, and less than three-fourths of the sawdust and other refuse produced is consumed.

GENERAL RESULTS OF TRIAL (AFTER PRELIMINARY TRIALS), NORMAL FULL LOAD.

Duration of Trial, 6 hours 54 minutes.

BOILER PERFORMANCE.

Total water evaporation ...	21,831 lb.
Evaporation per hour ...	3,164 lb.
Total wood refuse fuel ...	7,127 lb.
Fuel consumed per hour ...	1,032 lb.
Rate of combustion per sq. ft. of grate ...	28.7 lb.
Average steam pressure per sq. in. ...	153 lb.
Average steam temperature ...	578° F.
Average steam superheat ...	209° F.
Water evaporated per lb. wood refuse fuel ...	3.06 lb.
Equivalent evaporation from and at 212° F. ...	3.96 lb.
Guaranteed evaporation per lb. of fuel ...	3.6 lb.
Draught in flues close to boiler ...	0.6 in.

ENGINE AND DYNAMO.

Average steam chest pressure per sq. in. ...	143 lb.
Average steam chest temperature ...	508° F.
Average steam chest superheat ...	144° F.
Vacuum, engine gauge ...	24 in.
Vacuum, condenser gauge ...	27 in.
Total steam consumption ...	19,851 lb.
Total steam consumption per hour ...	2,877 lb.
Average indicated horse-power ...	270
Average kilowatts ...	159
Steam consumption lb. per kw.-hr. ...	18.1
Guaranteed steam consumption, lb. per kw.-hr. ...	18.83
Wood fuel consumption per B.T.H.U. guaranteed ...	6.5 lb.
Combined efficiency, I.H.P./B.H.P. ...	79 p.c.

The highest dynamo temperature, after more than seven hours' run at full load, was 140° F. on the interpoles, representing a rise of 70° F. above the atmosphere.

The voltage regulation tests showed between no load and full load a rise of 1.75 per cent., and between no load and 25 per cent. overload 2.75 per cent., the dynamo running at constant speed, without regulation of the shunt rheostat.

FIG. 6.—PAXMAN-G.E. CO. GENERATING PLANT.

required for all purposes in the mill, including the provision of steam for the drying kiln (which is on the Erith system), for one-tenth of one pound of coke per h.p.-hour and all the wood refuse produced by

The contractors for the different parts of the plant were:—Engines, boilers, etc., Messrs. Davey, Paxman & Co., Ltd.; 160-kw. generator, the General Electric Co., Ltd.; switchboard and distributing

board, Messrs. Dorman & Smith, Ltd., and Messrs. Ward Bros.; pneumatic dust-collecting and delivery plant, including motor and fan, etc., Messrs. Matthews & Yates; engine and boiler foundations, and

FIG. 7.—ELECTRIC FAN FEEDING BOILER WITH WOOD REFUSE.

chimney shaft, Messrs. Neil & Co.; steel roof principals and wind gable ends, Messrs. David Rowell and Co.; heating apparatus in timber drying kiln, Erith's Engineering Co., Ltd.

LEGAL.

READ v. THE STELLA CONDUIT CO.

THIS case came before the Court of Appeal, composed of the Master of the Rolls, Lord Justice Phillimore, and Mr. Justice Sargant, upon the appeal of the plaintiffs from a judgment of Mr. Justice Joyce, in the Chancery Division, dismissing the action.

The plaintiffs brought the action against the defendants for an injunction, damages and ancillary relief for the alleged infringement of Letters Patent No. 18,375, of 1905, granted to Jas. William Brooks and Albert Edward Read, for "an improved means for connecting tubular electrical conduits together, and for connecting the said electrical conduits to their fittings," without screwing.

The case was reported in the *ELECTRICAL REVIEW* of October 30th and November 20th, 1914.

Mr. Justice Joyce held that the gripping arrangement was a well-known and common one, and that there was no invention in the use of it in the patented appliance, and that the patent was invalid.

Mr. A. J. Walton, K.C., Mr. Colefax, K.C., and Sir Denham Warrington appeared in support of the appeal; and Mr. T. Terrill, K.C., and Mr. Arthur Gray for the respondent company.

At the conclusion of counsel's arguments on Thursday, March 30th, their Lordships reserved judgment.

LUND v. HALL.

BEFORE Mr. Registrar Wild, in the City of London Court, on March 30th, a claim was made by Richard Lund, carrying on business as Lund Bros. & Co., electricians, against Messrs. A. Hall & Co., decorators, &c., Dulwich, for £1 9s., for work done and material supplied. The plaintiff's case was that he had done work upon the instructions of the defendant at St. Marylebone Infirmary, where the defendant was carrying out some work by contract, and his workmen had damaged some electric light fittings. The defendant denied giving the plaintiff any order, and said his workmen did not cause the damage in respect of which the plaintiff was seeking to charge. The case was adjourned for the plaintiff to produce further evidence, the Registrar remarking that it was oath against oath as the case then stood. When the case again came before the Court, the plaintiff called Mr. Brook, engineer of the St. Marylebone Infirmary, who said that some time last August some work was being done at the Infirmary by the defendant's men. In one of the wards the defendant's men injured the electric fittings, and it was in the defendant's contract to replace them. The defendant commissioned Messrs. Lund's men to replace the damaged fittings and to send the bill in to him. The work was done the following day. Cross-examined by the defendant, witness said it was the defendant's contract to take down the gas fittings. In the ward in which the electric fittings were damaged, he (witness) said he took down the gas fittings. In answer to the Registrar, witness said it was not in taking down the gas fittings that the damage was done; it was done by the defendant's men in washing off and whitening the walls and

ceilings. The defendant said his men did not do the damage, and the engineer in question and the plaintiff were working together against him. The Registrar said that upon the evidence before him he must find that the defendant's men did the damage which the plaintiff had repaired. Judgment for the plaintiff, with an allowance of 5s. for the witness.

BALDRY v. SUN ELECTRICAL CO., LTD.

AT the Lambeth County Court, before Judge Parry, on Monday, S. T. Baldry, aged 14 years, brought an action through his father, J. W. Baldry, engineer, of 65, Kirkwood Road, Peckham, S.E., under the Workmen's Compensation Act, for compensation for injuries, the respondents being the Sun Electrical Co., Ltd., of Charing Cross Road, W.

Applicant was employed by respondents as a learner in November, 1915. A piece of steel shaving was thrown and struck his eye. He did not see where it came from. He was taken to the Royal Eye Hospital, St. George's Circus, where his eye was removed, and he remained as a patient until February 1st.

MR. SHAKESPEARE, for the respondents, said the boys had nothing to do with the metals with the exception of brass. If boys were larking and an accident occurred, the Court of Appeal had decided that such accident did not arise out of, or in the course of, their employment, and therefore did not come within the scope of the Act.

JUDGE PARRY said if that was so, they might as well shut out boys from the operations of the Act, as they were always larking. If the applicant had not been employed there he would not have met with the accident, and that, to his mind, meant arising out of, and in the course of, his employment. In view of the importance of the case, and the likelihood of an appeal, he reserved his judgment.

LINEMAN'S ELECTRIC SHOCK.

THOS. BANNON, telegraphic lineman, claimed compensation at Tullamore Quarter Sessions against the Postmaster-General in respect of injuries received by his sustaining an electric shock while working at the summit of a ladder or pole and falling a distance of 18 ft. He was three months in hospital. On the suggestion of the County Court Judge, it was agreed that applicant should get half wages from December 31st to March 14th, and nominal compensation was given to keep his interests alive pending his resumption of work. Costs were also allowed.

MUNITIONS CASES.

THE Bolton Munitions Tribunal, on March 30th, heard cases against four employees of the Chloride Electrical Storage Co., who were said to have refused to work overtime on March 27th. The men said they should have a day's notice, but were not warned until the same day. They had not brought their tea with them. For the firm it was pointed out that notice was given on March 16th that overtime would be worked on March 17th and until further notice. In addition, there were instructions for foremen to provide tea for men called to work overtime at short notice. Three of the men were fined 1s., and the fourth man was cautioned.

THE Warrington Munitions Court fined a firm of feeding-stuff manufacturers £10 and costs for employing men from a local contracted cable works without having obtained certificates of consent.

Notes from Canada.—Our Canadian correspondent

writes:—"One of the most important occurrences in the electrical supply situation in the province of Ontario, is the recent arrangement made by the Provincial Government, to purchase at a cost of over £1,600,000 all the interests of the Trent Valley power companies, whose operations cover the territory lying east of Toronto along the shore of Lake Ontario. This means that the water-power rights and properties of these companies are purchased for the people, and that they will be put directly under the administration of the Hydro-Electric Power Commission of Ontario, and it also means that with the exception of the large generating companies on the Canadian side, at Niagara Falls, practically all the large power sites and projects are now owned by the people and controlled by the Commission. As was recently pointed out in these notes, the territory at present served by this Commission is almost as large as England, while its powers, extending over the whole province as they do, cover an area three and a half times as large as the British Isles. The Provincial Government has decided to approve of the power development scheme proposed by the Commission for the Niagara River, whereby an ultimate capacity of 600,000 H.P. will be made available. For this scheme turbines and generators in units of 50,000 kw. capacity are being considered. The development of the water-powers of British Columbia is receiving careful attention at present. Existing plants have a capacity of some 230,000 H.P., and there is said to be about twelve times this power available for use. The Edmonton Power Co. proposes to construct a dam across the Saskatchewan River at a point about 75 miles west of Edmonton. There will be a head of about 80 ft. An electric railway will be built from the city to the dam.

ELECTRIC COOKING AT SWAN & EDGAR'S.

THROUGH the courtesy of Messrs. Swan & Edgar, the well-known drapery firm whose premises are a familiar landmark

ELECTRIC STEAMER, GRILL, FISH FRYERS, &c., AT MESSRS. SWAN & EDGAR'S.

in Piccadilly Circus, we were recently enabled to inspect the extensive electrical cooking equipment which has been installed within the last few months in connection with their staff catering department.

This installation has been carried out by Messrs. Locke and Soares, of 83-87, New Cavendish Street, W., the cooking equipment being supplied by the Jackson Electric Stove Co. and of their standard type.

The kitchen, which occupies a light and airy situation at the top of the building, is connected by service lifts with a servery on the floor below, where the extensive staff dining rooms are situated.

From the main switchboard in the basement, a special 220-volt 37/14 s.w.g. service is run to the top of the building to a 12-way D.P. 50-amp. per way glass fronted distribution board in the kitchen: the service is controlled by a 350-amp. Berry, Skinner D.P. switch and fuse, and a special meter. From the distribution board the circuits leading to the apparatus are carried round the walls, being run in solid-drawn heavy gauge screwed conduit, as is the case with the service leading up from the basement.

The apparatus installed includes two roasting ovens with double doors of the usual Jackson lagged type, each with a 7 kW. loading and three-heat control; a vegetable and pudding steamer of the cupboard type fitted with perforated shelves, &c.; a grill and hot cupboard, rated at 6 kW., of the standard Jackson type with three-heat control: two egg poachers for cooking 12 eggs at the

same time; two fish fryers, with 9 kW. loading and three-heat control, and a 10-gallon water urn with a 6-KW. loading.

Arranged along the far side of the kitchen from the entrance are a small boiling hob consisting of four hot plates of 5.5 kW. rating and four boiling pans of three and six-gallon capacity with nests of steamers above and a total loading of 10 kW., these being arranged on a bench; a large stockpot of 3.5 kW. rating stands on the floor and beside it a Cornhill potato peeler, chain-driven by a 1/2 H.P. motor—a piece of apparatus which will deal with a sack of potatoes in a matter of minutes.

Each unit of cooking apparatus is controlled by Diamond H switches of the series parallel or "on and off" pattern, with Zed fuses in circuit and provided with an indicating pilot light, these accessories being fitted on the wall adjacent to the apparatus controlled and coupled to the latter by armoured flexible cable. Practically all the apparatus is provided with three-heat control, and three apparatus—a 12-gallon steamer and two 10-gallon water boilers—have seven heat control. The servery is equipped with

a 5-KW. hot cupboard and carving table, two water urns, one being of the immersion heater type and a milk and coffee urn, the controlling switchgear and pilot lights being grouped on one board.

The total installed loading of the cooking installation is approximately 75 kW., and the maximum working load has, we understand, reached 55 kW.; it provides, daily, 80 breakfasts, 360 dinners, 360 teas, and 80 suppers, or a total of, roughly, 880 meals for the staff, and, we should add

ELECTRIC BOILING EQUIPMENT AND MOTOR-DRIVEN POTATO PEELER.

ELECTRIC OVENS AND KITCHEN DISTRIBUTION BOARD.

is giving great satisfaction in use. The staff dining rooms, with adjacent sitting and smoking rooms, are dependent on electric heat, and five 3-kw. Belling fires and one of 2 kw. loading by the same maker have been installed for this purpose.

In conclusion, we are indebted to Messrs. Locke & Soares for the data published herewith.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Electric Capstan Control Gear.

The severe conditions of operation of electric capstans and winches call for extremely simple, robust and reliable control gear if satisfaction is to be given to the user.

FIG. 1.—PEDAL SWITCH FOR ELECTRIC CAPSTAN.

FIG. 3.—CONNECTIONS OF CAPSTAN CONTROL EQUIPMENT.

FIG. 2.—ACCELERATING UNIT FOR ELECTRIC CAPSTAN

In order to meet these requirements the BRITISH THOMSON-HOUSTON CO., LTD., of Rugby, has developed a special control gear, of the automatic fool-proof type, which comprises a pedal switch designed for use in a covered yard or on an exposed wharf, and an accelerating unit consisting of a series of electrically-operated contactors. The pedal switch does not carry the main current, but, when depressed, closes the operating coil circuit of the first, or shunt, contactor, causing it to close and complete the motor circuit through the starting resistance.

The remaining contactors close successively, cutting out resistance automatically at the proper time.

Fig. 1 illustrates a type P, form F, capstan pedal switch designed for exposed situations, while fig. 2 shows an accelerating unit—a standard S.M.C. starter, in a ventilated iron case. Tubular form resistance units are supplied in connection with the above.

Fig. 3 shows diagrammatically a capstan control equipment arrangement.

An overload relay can be fitted to the contactor panel, and special contacts are provided on the pedal switch, in such a case, to reset the relay.

Control equipments for reversible capstans are also supplied, operated by two mechanically interlocked pedal switches, one for each direction of motion; a special triple-pole contactor, fitted with magnetic blow-outs, is supplied for use with A.C. squirrel-cage motors, which can be connected direct to the line through such a contactor.

Belling Cooking Apparatus.

MESSRS. BELLING & Co., of Edmonton, N., have recently issued a leaflet dealing with their electric kitchen appliances, including

FIG. 4.—BELLING GRILLER-TOASTER.

FIG. 5.—BELLING ELECTRIC WATER TANK

the Belling oven, griller-toasters, hot-plates, electric water-tank, &c. A recent introduction is a low-priced griller-toaster, fig. 4, to meet the needs of the small householder. The top is available for keeping things warm, while cooking is proceeding underneath, on the grill: a drip-pan and grid (10 in. x 8 in.) are provided, and three heating elements are fitted, giving a 1½-kw. loading, and 4 ft. of cable are supplied with the apparatus.

A large and more substantial apparatus of the same kind, with 3½-kw. loading, is also supplied.

Fig. 5 is a 3-gallon electric water-tank, made in polished copper, with removable lid. This has a 2 kw. loading, and is supplied with a control panel fitted with a three-heat switch, fuse, plug and socket, &c.

Indicating Crane Signal.

In large shops where cranes are continually moving back and forth, workmen naturally waste considerable time watching in what direction the cranes are moving. To reduce this waste a signalling system for indicating whether the cranes are moving forward or backward has been developed. The outfit consists of red and green lanterns mounted on both sides of the crane, the lamps of which are connected to the motor circuits. The red lanterns of one side and the green of the other side are connected to the same circuit, with the system so designed that when the crane moves in one direction one set of lamps is automatically lighted, and when the motor runs in the other direction the other set is lighted. Thus, when a person is in a certain position, and the red lantern is lighted, it indicates that the crane is approaching him, and if the green lantern is lighted, the crane is departing. When

the crane is standing still, no lights are shown. The number of lanterns employed is optional—three on a side for each colour being generally used. When the cranes are equipped with indicating signals, it only takes a glance to determine definitely whether the crane is approaching or departing, the workmen knowing instantly whether they are in danger or not. The indicating signals are said to be very useful to operators of neighbouring cranes, mini-

FIG. 6.—DIAGRAMS OF CONNECTIONS FOR CRANE SIGNAL.

misg the possibility of collision, and enabling the operator to give practically all his attention to the floor level, since the signals come automatically within his vision with the approach of another crane, thus relieving him of strain, and greatly increasing the general safety. The device is being made by the NICHOLS-LINTNER Co., Cleveland, Ohio.—*Electrical World*.

WAR ITEMS.

Exemption Applications.—At a sitting of the Batley Tribunal last week, a local firm applied for exemption on behalf of an electrician and an engineer. The representative of the firm stated that the engineer was not the chief engineer, but it was thought that a concern such as that with which he was connected should be entitled to more than one engineer to attend to two large engines as well as dynamos and motors. He wished the members of the Tribunal could spare time to inspect the firm's plant in order to form an idea as to whether one or two men were required to run it. A member of the Tribunal suggested that the firm should secure somebody of non-military age to take the place of the engineer, but the applicant said the difficulty in doing that was that the older engineers knew very little about electricity. The number of men competent to deal with alternating current was extremely limited, and the applicant firm had both D.C. and A.C. The Chairman intimated that the Tribunal were strongly opposed to granting any further time, but they would allow until April 15th. They thought that if the firm advertised they would be able to secure a suitable man.

Before the Doncaster Tribunal last week exemption was asked for on behalf of an electrician in the employ of the G.N.R. carriage and wagon works, who was engaged upon train lighting. The Railway Co. stated that the man could not be spared. Postponement until May 31st.

At Blackpool Appeal Tribunal, on March 30th, the general manager of the Tower supported the application for exemption of the electrical engineer and his chief assistant. They had 70 men serving, and had not appealed for a single man. Temporary exemption was granted until the end of October.

At the Durham County Appeal Tribunal, held at Darlington, an electrical engineer in business at Stockton asked for an extension. One partner was already in the Army, being chief electrical engineer in the Northern Command. At the beginning of the war they employed six men, all of whom had joined the Colours, save one who was engaged on munitions. An arrangement was made that whichever of the partners was first accepted for service, the other would remain and try to keep the business going. Appellant was the only one left in the business. He was not unwilling to serve. It was a question entirely of serious financial and business obligations. He asked for three months, and then, even at great sacrifice, he would follow his partner. The parents of the partners would have to sacrifice the money advanced to establish the business. Three months' extension, from March 14th.

At the Middlesbrough Tribunal, an electrician, trading as an electrical contractor, contended that, in view of his business he was a starred man. He had an invalid wife and child dependent on him, and the allowance which he would receive from the Government in the event of his joining the Army would be quite inadequate. Postponed until April 30th.

At the Portsmouth Tribunal, an electrician appealed on behalf of his apprentice aged 19, on the ground that he was indispensable, owing to the shortage of electricians, and to his being engaged in Government work. The case was adjourned so that the employer could apply to the Minister of Munitions for a ruling as to whether the occupation of an electrician is considered a starred one or not.

At the Erpingham Tribunal, Lord Suffield, through his

agent, appealed for his electrician, aged 23, single, who has charge of a valuable electrical plant at Gunton Hall, and also of a gas plant. The claim was made on the ground that if the man had to go it would be a serious hardship to his employer, as he could not be replaced. Exemption was refused.

The Grantham Tribunal has granted conditional exemption, until July 1st, to two employees (switchboard attendants) of the Urban Electric Supply Co.

At Canterbury, on March 27th, Mr. Dashwood, electrical engineer, applied for exemption of an electrical wireman, who had six months of his apprenticeship to complete. Mr. Dashwood stated that he had already released six men, and applicant was the only man of military age left. The Military declined to regard the occupation as being on the reserved list. A month's exemption was granted.

The Wakefield Tribunal have granted varying periods of exemption—in the majority of cases total exemption so long as the men remained in their present employment—in respect of 52 employees of the Yorkshire (West Riding) Electric Tramway Co., who stated that the men were mostly skilled workmen employed at the tram depot, and were absolutely indispensable to the proper working of the tramway system.

At Dukinfield, exemption was sought for two employees of the Tudor Accumulator Co., Ltd., whose works are Government controlled. The men stated that they were engaged on casting plates for miners' electric safety lamps. A representative of the firm stated, in answer to questions, that their hands were fully occupied, and it was not a fact that they were working the men only six hours per day. Ald. Garner (a Military representative): We are informed the firm could easily discharge fifty men at the present time without inconvenience. The firm's representative: I do not know where you could have got that information. It is incorrect. He added that the men were on work of national importance, and that the cases ought not to have come before the Tribunal at all, because the men were in a certified occupation. Temporary exemption was granted for two months.

At Rochdale, an electrical wiring contractor appealed, and stated that he would be of more service in a shell factory than in the Army, as he was a skilled turner and was willing to go on munitions. He had applied for work of this sort, but had not yet succeeded in getting any. The appeal was dismissed, but 14 days' grace was allowed so that applicant could finish work on hand.

A Publicity Man with the Forces.—The following is an extract from a letter received from Lieut. A. R. Courtenay, who, before taking up his commission, was acting publicity manager to the General Electric Co., Ltd. Writing on active service with the Mechanical Transport (M.T.) A.S.C., from Alexandria, he says:—

"I am with a splendid Company. We run our own Pierrot Concert Party, which has become very famous, the zenith of our fame being reached recently when we gave a concert at The Alhambra Theatre in aid of the United Services Recreation Fund. A week before our name was practically unknown, but on the night of the show we had a record full house of 2,000. Being responsible for the publicity work, I was thoroughly in my element. Within forty-eight hours of being told to 'carry on,' I had the town painted green with posters, nearly a thousand of which were distributed to all the principal shops in the town and district. These were backed by 5,000 small handbills and a large quantity of small invitation tickets. The stunt, however, was my troupe of Arab sandwichmen, a method of publicity which had never been seen before in Alexandria. I had 14 in all, divided into two groups, one group having the letters E.M.P.T.I.E.S. on their front board and a poster on their back, and the other group vice versa. Being quite unable to read English characters they did not at first appreciate the importance of keeping their places; hence the letters showed an inclination to wander at times, and I had drilled them. Chattering incessantly, they every now and again hailed a passing acquaintance, and at times I feared they would obstruct the traffic, as they attracted so much attention. Their appearance caused endless amusement, not only amongst themselves, but throughout the town generally. Considering there are no English composers here, the printed matter was turned out very creditably."

Companies to be Wound Up.—In the latest list of companies ordered by the Board of Trade to be wound up the following appear:—

Veithardt & Hall, Ltd., 41, Eastcheap, London, E.C., iron and steel importers. Controller: A. J. Foster, 37, Wallbrook, E.C.

Gustav Rosenmann, 194-200, Bishopsgate, E.C., hardware merchant. Controller: N. W. Wild, 22-28, Broad Street Avenue, E.C.

C. F. H. Müller, 47, Red Lion Street, W.C., manufacturer of X-ray tubes. Controller: H. L. H. Hill, 2, Broad Street Place, E.C.

London Electron Works Co., Ltd., Regent's Dock, Limehouse, London, E., dealers in old tin. Controller: A. Taylor, Thames House, Queen Street Place, E.C.

French Industries.—The "Times" states that M. Clémentel, French Minister for Commerce, has recently instituted a technical organisation to deal with all questions relating to such industries as are not exclusively concerned with war purposes.

Swedish Export Prohibitions.—The Swedish Chamber of Commerce for the United Kingdom announces that the following articles have been added to the list of goods which are now prohibited for export from Sweden:—Calcium carbide, nitrogen carbide. "Times."

Russian Electrical Companies.—Owing to military events, says a Petrograd paper, the Dvinsk Electrical Co. has removed from Dvinsk to Orel; Y. A. Shapiro, from Wilna to Petrograd; B. Petsh, Poland to Petrograd, Sampsonievsky Prosp. 34a; Titan, Poland, to Moscow, Pylaitskaya 62.

Thanks from the Front.—A correspondent with the British Expeditionary Force says:—"The 'Electrical Review' continues to reach me regularly each week, and is very welcome too, I assure you. Mr. Carter's article in last week's issue on the resistance of a cube was very interesting. I manage to find time, during odd minutes, to wrestle with such problems, and to digest the various technical articles—in fact, there is not much of the paper that goes unread. The other day I happened across a man who, in normal times, is on the constructional staff of the Westinghouse Co. We had a brief chat, and he was quite pleased to have one or two back numbers of the 'Review' that I was able to give him."

After-the-War Trade.—In reply to a Parliamentary question, Mr. Runciman says that the Government fully appreciates the importance of preserving and extending British trade in neutral markets. The subject will come under the consideration of the special committees which are being appointed to inquire into the position of certain important branches of British industry after the war. In addition, Mr. Ainscough, who has recently completed a commercial mission in China on behalf of the Board of Trade, has been closely in touch with important British firms trading with the Far East, and will be glad to receive further information as to their views.

Municipal Corporations and Enemy Companies.—The Blackpool and Eccles Corporations propose to follow the lead of Manchester by adopting standing orders to the effect that no contract shall be entered into with any person of German or Austrian nationality, and no contract shall be entered into with any firm or company whose subscribed capital (whether by way of shares or otherwise) is held or controlled to the extent of one-third or upwards by persons of German or Austrian nationality. Heywood Corporation G.P.C. has rejected a proposal in the same sense by ten votes to eight.

BUSINESS NOTES.

Dissolutions and Liquidations.—**ADNIL ELECTRIC CO., LTD.**, Adnil Building, Artillery Lane, Bishopsgate, E.C.—The report of Mr. H. E. Burgess, Official Receiver, in this matter, has now been issued to the creditors and shareholders. The compulsory winding up order was made last October on the petition of a creditor, and accounts have been lodged showing liabilities £34,333, assets expected to produce £28,591, and a deficiency of £15,741 with regard to contributories.

According to the Official Receiver's report the company was registered on June 29th, 1909, as a private company, and was formed to carry on the business of electrical engineers and dealers in electrical appliances. It held the agency for this country for the Bergmann-Elektricitäts-Werke, of Berlin (hereinafter referred to as "the Bergmann Co."). The directors of the company were P. Berthold, J. Hiesink and E. S. Moran, all of the Bergmann Co. On the incorporation of the company, S. G. Leach and R. A. Marples were appointed joint general managers, but they were not directors. Although not strictly so in form, the company might be described as a reconstruction of Marples, Leach & Co., Ltd. (the "old company"). That business was founded in 1904 when it acquired the sole agency in this country for the Bergmann Co., and it was registered as a private company on April 6th, 1908. Debentures for £7,500 were issued, and on May 14th, 1909, the old company went into voluntary liquidation. The liabilities, in addition to the debentures, amounted to £24,408, of which £23,305 was due to the Bergmann Co. As a result of the liquidation the debentures were paid off in full, and the ordinary creditors received dividends amounting to 7s. 3d. in the £. The Bergmann Co. provided £9,001 out of a total of £9,520 required to pay the dividends referred to, and the transaction took the form of a payment as the purchase price of the stock. Mr. Leach explains that the reason why the Bergmann Co. appear as such large creditors is that on the liquidation they purchased the claims of all the English creditors, who thus received 20s. in the £, the loss of 12s. 3d. in the £ falling on the Bergmann Co.

After the incorporation of the Adnil Co. the question of the acquisition of the goodwill of the old company appears to have been considered, and resolutions are recorded in the minute-book, under date, Berlin, July 2nd, 1909: "That Messrs. Marples & Leach should make arrangements with the Receiver for debenture-holders and/or liquidators of the old company to pay him, or them, for the transfer of any orders coming in a commission of 5 per cent. This arrangement to continue until superseded by any arrangement to purchase the goodwill. Berlin, August 18th, 1909: It was resolved to acquire the goodwill of the old company, the consideration to be such a sum as should represent the net profits made by the old company for the two years preceding the liquidation, &c. It does not appear from the books of the company that these resolutions were ever carried out; in fact, the only relevant entry in the books which the Official Receiver has been able to trace is an item of £45, which was credited on July 1st, 1910, not to the Receiver or liquidator of the old company, but to the Bergmann Co., in respect of the 5 per cent. commission referred to in the resolution of July 2nd, 1909, and debited to the goodwill account. But on June 30th, 1910, a goodwill account was opened, and a sum of £7,500 was

debited to that account, and credited to the Bergmann Co., the figure being described as the loss in the liquidation of the old company, presumably the loss incurred by the Bergmann Co. Of the £7,500, £1,500 was subsequently transferred from goodwill account to fixtures, machinery, and tools account, thus reducing the goodwill to £6,000, and from that date there has always appeared in the books and accounts of the company an item of "goodwill £6,000" and a special credit to the Bergmann Co. of that amount. It was intended that this goodwill item should be written off from profits each year, but no reduction of it appears to have been made. It is not clear upon what grounds the Bergmann Co. thought themselves justified in putting upon the shoulders of the Adnil Co. the loss they had incurred in connection with the old company, for that appears to be the effect of the entries above described. There is no evidence that they had ever bought its goodwill; nor can it be suggested that the credit raised in their favour was in consideration of their allowing the Adnil Co. to use the stock which the Bergmann Co. had bought from the liquidator of the old company, for there is evidence that the stock was acquired by this company quite apart from the goodwill transaction, thus:—On June 28th, 1910, £7,096 was credited to the Bergmann Co.'s stock account, and debited to this company's goods account in respect of the stock purchased from the liquidator of the old company.

All the directors being in Germany the Official Receiver has had no opportunity of examining them, and his opinion is therefore based upon the facts as recorded in the books, but as at present advised he can see no grounds for any valid claim by the Bergmann Co. against the company in respect of the £6,000 before referred to, which is included in the unsecured debts now owing. This, however, is a matter which will have to be dealt with by the liquidator.

The nominal capital of the company is £10,000 in £1 shares, all of which have been issued, and are fully paid up. There are only three shareholders, the two signatories to the Memorandum and Articles of Association, who hold one share each, and the Bergmann Co., who are registered as the holders of 9,998 shares. Of the amount payable on the shares £1,000 was paid in cash by the Bergmann Co. in June, 1909, and £1,700 was paid to the company by the Receiver of the old company, but credited to the Bergmann Co., in September and October, 1909. The balance of £7,300 was paid by the Bergmann Co. on June 27th, 1911, but on the same day a cheque for £7,300 was paid to the Bergmann Co. on account of the amount due to them for goods supplied. No debentures were issued by the company. According to the accounts, which were audited annually by a firm of London chartered accountants, the results of the trading from the formation of the company were as follows:—Year ending June 30th, 1910, loss £178; June, 1911, loss £62; June, 1912, profit £639; June, 1913, profit £1,025; June, 1914, profit £245. In the year ending June 30th, 1913, a dividend at the rate of 5 per cent. per annum was paid, free of income-tax. No other dividends appear to have been paid. Shortly after the outbreak of war Messrs. Leach & Marples, the joint general managers, discovered that, owing to the company's German connection, the customers would no longer give any orders to the company, but many of them stated that they would have no objection to giving orders to Marples & Leach personally, upon their undertaking that no benefit from the orders should go to the Germans interested. There was a large stock on hand, and Marples & Leach thereupon began to take and carry out orders in the name of "Marples & Leach." The stock required to enable them to carry out these orders was taken from the company's stock, at stock book prices, and although in the absence of any directors it was impossible for them to enter into any written contract with regard to the matter, the arrangement they had in view was that they should pay the company one-third of the gross profit on such orders in respect of their use of the stock, offices, staff, &c. In cases where it was necessary to purchase material for the carrying out of these orders the company paid for it, and "Marples & Leach" used it on the terms above stated. They opened a separate bank account in the name of "Marples & Leach" in connection with the business so carried on, and paid all proceeds of such trading into the credit of that account. It was also arranged that for the protection of the company cheques on the "Marples & Leach" account should be countersigned by the company's auditor. At the date of the provisional winding-up order there was a sum of £4,887 standing to the credit of the "Marples & Leach" account, which was handed over to the Official Receiver. Mr. Marples left the company's service in June, 1915. An item "other liabilities, £1,216," shown in the statement of affairs, represents the claims of Messrs. Marples and Leach for a share of the gross profit above referred to. These claims will be dealt with by the liquidator.

In August, 1915, a proposal was made to the special manager by S. G. Leach for the purchase of the goodwill, stock, furniture and fittings of the business. The offer was considered at a meeting of the principal creditors of the company in this country, and an application was made to the Court, which made an order approving the sale to Mr. Leach. On October 12th, 1915, an agreement was entered into between the company and S. G. Leach and another for the sale to them of the goodwill, stock, furniture and fittings. The sum of £500 was paid on the signing of the agreement and the balance of the purchase price (about £3,390) is payable by monthly instalments for two years from December 1st, 1915. The book debts are not included in the sale. The failure of the company is directly attributable to the war. Mr. Leach states that the company had never done so well as in the early months of 1914. After war commenced, he and Mr. Marples did all they could to preserve it, but without avail, and in the absence of the

directors they found it impossible to carry on the business any longer. The claims of the creditors are entirely on trade accounts, except £128 due for rent, and £6,000 shown by the books to be due to the Bergmann Co. on goodwill account. The total amount shown by the books as due to the Bergmann Co. is £27,706, including the £6,000 referred to. There is also £1,965 stated to be due to the Deutsche Telephone Werke G.m.b.H. of Berlin, which, the Official Receiver is informed, is not connected in any way with the Bergmann Co. As the result of the statutory meetings of creditors and contributors, reported in the ELECTRICAL REVIEW for March 3rd, the Court has appointed Mr. J. H. Stephens, of 6, Clement's Lane, Lombard Street, E.C., as liquidator of the company.

[We understand that the report which appeared in our issue of March 3rd, although strictly accurate, is likely to give a wrong impression. Mr. S. G. Leach ceased to be associated with the Adnil Co. in October last, when he formed an entirely new company under the title S. G. Leach & Co., Ltd., to take over the goodwill, fittings, fixtures and stock-in-trade of the Adnil Co., under agreement with the Official Receiver, thus securing for a company which is entirely British (capital, directors and staff), having no enemy interests whatever, either direct or indirect, the business which during the last seven years has been held by the Germans. We understand that somebody has been suggesting that the new firm are preserving the business for the benefit of the Germans, but we are assured that far from that being the case, the new concern in actual fact represents an effort to get back a business which was originally founded by Englishmen, but through force of circumstances, fell into the hands of the Germans.]

In the above Statement of Affairs, it is mentioned that the old firm of Marples, Leach & Co., Ltd., paid a dividend of only 7s. 9d. in the £, but Mr. Leach calls our attention to the fact that all the British creditors were paid 20s. in the £, and this was the condition made by the shareholders of Marples, Leach & Co., Ltd., to the Bergmann Co. in surrendering their shares to them at the Marples, Leach & Co., Ltd., liquidation. Mr. Leach says: "It suited the Bergmann people to allow the liquidation to take 4-5 years to finish, and with one of their own servants—Mr. George Ambach—as co-liquidator, they were practically in the position to declare any dividend which pleased them. In this way the 7s. 9d. statement rather places the Marples, Leach & Co., Ltd. liquidation in a light which is not strictly accurate, nor fair to Marples & Leach. It is also to some extent affecting the new company which, of course, is now in no way connected with the Adnil Electric Co., Ltd., (in liquidation)."

ELECTRO-STEEL FOUNDRIES, LTD., Darlaston.—A dividend of 20s. in the £ is payable at the office of the liquidator, Carey Street, W.C.

Book Notices.—"Technological Papers of the Bureau of Standards." Nos. 52, 54 and 55, "Electrolysis and its Mitigation"; No. 56, "Protection of Life and Property Against Lightning." Science Papers: No. 259, "A New Relation derived from Planck's Law"; No. 266, "Preparation of Pure Iron and Iron Carbon Alloys." "Bulletin of the Bureau of Standards" Vol. XII. No. 3. February 3rd, Washington: Government Printing Office.

"Whittaker's Arithmetic of Electrical Engineering." London: Whittaker & Co. Price 2s. net.

We have received a copy of No. 1 of a new sixpenny monthly journal, known as *The British Manufacturer*. Its object is to promote trade in the Empire and beyond, and it contains a number of articles which should interest those who are concerned with export trade matters.

"Electric Bells and Telephones." By B. E. Jones. London: Cassell & Co., Ltd. Price 1s. net.

"A Treatise on Electricity." By F. B. Pidduck. London: Cambridge University Press. Price 14s. net.

Thomas Alva Edison. By F. Rolt-Wheeler. London: Macmillan and Co., Ltd. Price 2s. net.—This is a "live" story about a "live" American, one of the most notable of those whose biographies are given in this series of "True Stories of Great Americans," which, by the way, includes Christopher Columbus. The subject is held up as "the typical American"—practical, enterprising, utilitarian, self-made, a glutton for work, inquiring to the last degree; like Newton, he was regarded as a dunce at school, and throughout his life mathematics has been his pet aversion. He had, however, an aptitude for making use of the acquirements of others, which was invaluable to him in the development of his great undertakings. But we do not propose to follow the author through the wonderful career of the great inventor; suffice it to say that the tale is told in a most interesting fashion, and is brought right up to date, for the last episode recorded in the book is the story of how Edison found a way of producing carboic acid from American coal, in the spring of last year, when faced with the stoppage of supplies by the European War. The story of his life is a most fascinating one, and is here so admirably treated, that we can cordially recommend the book to our readers.

Bankruptcy Proceedings.—G. E. BONNER, electrical engineer, Palmers Green, Middlesex.—The adjourned public examination of this debtor was held at the Court House, Edmonton, on April 3rd, but no further questions were asked, the debtor merely signing his evidence.

New Russian Electrical Company.—The Erg Electrical Factories Co. is being formed for the manufacture and exploitation of electrical equipment: capital 250,000 roubles. It will take over the business of Prince I. D. Avaloff & Co., Petrograd.

The Industrial Development of India.—In a Parliamentary reply to a question regarding the Commission to inquire into the economic resources of India, Mr. Chamberlain says, according to the *Times*:—"I understand that the Commission will be asked to report on the possibilities of further industrial development of India, and in particular, first, as to possible new openings for the profitable employment of Indian capital; and, secondly, whether the Government can usefully give encouragement by providing technical advice, by practical demonstrations in the case of particular industries, by financial assistance, or by any other means not incompatible with the existing fiscal policy of India."

Catalogues and Lists.—MESSRS. ROSE BROS., 25-27, Milton Street, London, E.C.—Temporary catalogue of electric pocket and hand lamps, scientific novelties, Fulmen educational working models, also of measuring instruments made by the Compagnie F.A.C. Da Dutilh, Paris.

MESSRS. FALE, STADELMANN & CO., LTD., 83-87, Farringdon Road, London, E.C.—Catalogue No. 409 (24 pages), giving illustrated particulars and prices of "Efesca" lanterns for half-watt and vacuum tungsten lamps for street, shop interior and exterior, and industrial lighting. Copies will be sent to any reader interested in the lighting of munition or other factories.

MESSRS. DRAKE & GORHAM, LTD., 66, Victoria Street, London, S.W.—Eight-page pamphlet (No. 240), giving illustrated particulars and prices of a number of vacuum cleaners—the "Santo," the "Econo," the "Little Briton," and the "Premier."

SWEDISH GENERAL ELECTRIC, LTD., Canada House, Kingsway, London, W.C.—April, 1916, stock lists of D.C. single-phase and polyphase motors and generators that are in London ready for delivery.

MESSRS. H. DUNOD & E. PINAT, 47 and 49, Quai des Grands-Augustins, Paris.—Summarised extract from their general catalogue of books, list of works recently published or reprinted, and prospectus of the "Agendas Dunod."

Trade Announcement.—MESSRS. EDWARD LE BAS AND Co., of Dock House, Billiter Street, E.C. have taken up the sole selling rights for Great Britain for "A.P.M." patent asbestos protected steel sheets, &c.

For Sale.—The Coventry Corporation Electricity Department has for disposal one 600-kw. McLaren-Siemens and one 600-kw. McLaren-British Westinghouse generating set. See our advertisement columns to-day.

LIGHTING AND POWER NOTES.

Atherton.—STREET LIGHTING.—The U.D.C. has decided to ask the South Lancs. Tramway Co. to arrange for the lighting of all the electric lamps on the tramway poles in the district, in order that the Council may obviate the need for lighting the gas lamps on tramway routes.

Bridlington.—PRICE REVISION.—The T.C. has decided to revise the electricity charges as from the June meter readings. For lighting the price will vary from 5½d. per unit for the first 500 units per quarter, to 4d. per unit for over 1,500 units. The heating and cooking rate will be 2d. to 1½d. per unit, according to amount.

Bo'ness.—PROPOSED LOAN.—The Public Works Loan Board has replied to the T.C., which asked for a loan of £14,500 for the proposed electricity works extension, that it is unable to accede to the request. Recently the Council submitted a proposal for a loan to various banks and insurance companies, but the replies were unfavourable, the parties approached having no funds at present in hand. The Council has an application pending before the Secretary for Scotland for sanction to a loan which it is apparently quite unable to procure.

Continental.—AUSTRIA-HUNGARY.—A census of electric machines has been ordered in Hungary, and all owners are required to declare their existing stocks of motors, electric machines and apparatus, in order that the latter may be requisitioned by the military authorities.

GERMANY.—Electricity supply is to be made a Government monopoly in Saxony, the Government intending, it is said, to lay before the Landtag a Bill to this effect. The State will undertake the distribution of electricity, hoping thus to obtain a new source of revenue. Municipal and private owners will be indemnified. The total cost of the purchase is estimated at 62,500,000 francs. In anticipation of the realisation of this scheme, the State has already purchased from the City of Leipzig the collieries owned by the latter at Lausitz and near Regis.—*L'Industrie Electrique.*

ITALY.—A new central station has been completed for the Voltorno municipality. This is equipped with three 6,000-kw. three-phase transformers, for transforming energy received from Capo Voltorno, and it further contains a stand-by generating plant, consisting of three 1,200-kw. Diesel engines, coupled to three-

phase alternators and a smaller auxiliary 120-kw. Diesel set of the same type. The plant was supplied by the Italian Oerlikon Co. and Messrs. Sulzer Bros. The building will be much enlarged when the second Volturmo waterfall is brought into use.

SWEDEN.—According to a return lately issued by the Swedish Water Power Association, new water-power utilisation plants to the extent of 28,000 H.P., exclusive of the Government works at Porjus and Alfkareby, were last year completed in Sweden. The major portion of the new plants, 12,000 H.P., was in connection with the timber, wood pulp and paper industries; 9,000 H.P. was in connection with the iron and mining industries; 1,500 H.P. for the chemical industry; 500 H.P. for the textile industry, and 5,000 H.P. was divided over various other industries.

Derby.—**PROPOSED LOANS.**—The T.C. has applied to the L.G.B. for sanction to loans of £3,000 for motors, and £1,000 for mains, required for urgent service.

Dublin.—**THE ELECTRICITY UNDERTAKING.**—Writing in reply to strictures on the city electricity undertaking by the *Irish Independent*, Mr. J. J. O'Neill, chairman of the Dublin Electricity Supply Committee, denies that there was a deficit of £27,000 on the working for the nine months ended in December last, and asserts that, as a fact, there was a profit of about £3,000. As to the description of the refunding of cost of a new service by a prospective consumer as "extraordinary," he admits that it is not the ordinary arrangement in Belfast and in English cities, where, he says, the consumer has to pay at present the cost of the service and receives no refund, whereas in Dublin the cost is paid back to him in instalments which leave the Corporation without loss on the transaction. As it is not possible to raise any loan just now, the Committee adopted this method as most reasonable to the consumer.

The *Independent* says the Committee's report, signed by Mr. O'Neill, gives the total payment for the nine months to December 31st as £29,643, and the receipts as £25,673, and wishes to know, if the undertaking is conducted with the good results Mr. O'Neill attributes to it, "why the Committee refrained from submitting estimates for the coming year." The journal also asks why Mr. D'Alton's report to the Special Investigation Committee is not published officially.

STREET LIGHTING.—The Public Lighting Committee of the Corporation has been considering the best means of curtailing the expenditure on the street lighting during the next 12 months, the City Council having been obliged to reduce by £4,000 the amount to be provided for the purpose. The Committee has decided that the arrangement likely to cause the minimum of inconvenience to the public would be the complete discontinuance of the lighting of a proportion of the street lamps for the coming 12 months rather than the serious reduction of the lighting hours of all the lamps.—*Irish Times*.

East Ham.—The Finance Committee of the Corporation has had under consideration the question of increasing the price of energy used for public lighting, but has deferred the matter for the present.

Ilford.—**LOAN SANCTION.**—The L.G.B. has now sanctioned a loan to the U.D.C. of £870 to defray the cost of an electrical engine room at the refuse destructor.

Kingston-on-Thames.—**REVISED TARIFF.**—The Lighting Committee of the T.C. reports having further considered the mode of charging for the supply of energy, and states that it has adopted the following scale:—Lighting, first 3,000 units a year, 6½d. per unit; second 3,000, 6d.; third 3,000, 5½d.; fourth 3,000, 5d.; all over 12,000, 4½d. Basement lighting, first 3,000, 5d.; second 3,000, 2½d.; all over 6,000, 2½d. Power, heating and cooking, first 10,000, 1½d.; second 10,000, 1½d.; next 50,000, 1½d.; second 50,000, 1½d.; all over 120,000, 1d. A transformer and automatic circuit breaker are to be obtained at a cost of £164.

Lancaster.—**PRICE INCREASE.**—The T.C. has decided to increase the price of electricity for lighting from 1½d. to 4½d. per unit; for general motive power, from 2½d. to 3½d. per unit; and for large consumers an increase from a third of a penny to a halfpenny per unit, in addition to the standing charges. The question of increasing the charge to the Tramway Committee is in abeyance.

Leicester.—**YEAR'S WORKING.**—The accounts for the year ended December 31st last show that 6,937,190 units were generated at the Aylestone Works, 5,214,419 units being sold, this including 3,029,391 units sold for power and lighting. The total revenue amounted to £46,257, a slight reduction on the previous year, while the total costs amounted to £26,881, some £3,200 increase on the previous year (when about 300,000 extra units, practically all for power, were sold). The gross profit, £19,376 was absorbed in meeting interest, sinking fund, and appropriations of £3,000 for a new boiler, &c., and £752 to reserve. The reserve fund in hand, in addition to the above, amounts to £10,911.

The Aylestone station supplied 1,312,400 units to the Lero station. The Lero station had an output from steam plant of 15,370,954 units, of which 1,324,098 units were required for station plant, 7,380,179 units were supplied to power consumers and the balance to the tramways undertaking. The power consumers supplied from the Lero plant numbered 260, with 9,100 H.P. of motors. The total costs of the Aylestone undertaking averaged 123d. per unit; the receipts were 213d. per unit, and the surplus (£3,752), after meeting interest, sinking fund, &c., was 173d. per unit. The overall costs of the Lero station, including interest and sinking fund charges, were 62d. per unit, and an average of 84d.

per unit was received for the power units sold, the surplus (on power supply only), after allowing for distribution, interest and sinking fund charges on cables, &c., being 1098d. per unit, or, roughly, £3,000, which is incorporated in the tramway accounts.

London.—At the City Corporation meeting, last week, a resolution was adopted instructing the Streets Committee to take the necessary steps to oppose the application of the Charing Cross Electricity Supply Co. to the B. of T. for consent to increase the maximum lighting rate. An amendment that it be referred back to the Streets Committee for reconsideration was rejected by one vote (82 to 81), and the original motion carried. In moving the amendment, the Chairman of the Streets Committee pointed out that the company was paying 60 per cent. more for coal, and that the costs of labour had considerably increased, and the Committee considered the increase fair and reasonable.

BETHNAL GREEN.—The Electricity Committee announces that considerable progress has been made with the work of laying cables, &c., in the borough, and it is hoped to be in a position to supply electricity in the western portion of the district in the course of a few weeks.

HOSPITAL LIGHTING.—The Children's Committee of the Metropolitan Asylums Board has reported upon the defective condition of the electric lighting installation at the Children's Infirmary. The institution is partly lighted by electricity and partly by gas; the electric installation is in an extremely bad condition, and considerable overhauling will have to be carried out. The total cost of the work is estimated by the Board's engineer-in-chief at £215. The matter has been referred to the Works Committee to be dealt with.

SOUTHWARK.—In January last, the B.C. referred back to the Electricity Committee the accounts of the undertaking for the 12 months ended March 31st, 1915, with a view to its submitting proposals for obviating future loss, and for effecting economy in the working of the station. At the meeting of the B.C., last week, the Committee reported having inquired into the deficit of £6,410 on the year's working, which it attributed to the unprecedented conditions prevailing consequent on the war. The Committee is satisfied that the number of hands now engaged is at its minimum, and, so far as the general management and conduct of the station is concerned, it can, at present, see no grounds for recommending any alteration. The Committee expects to benefit next year from the recent revision and increased charges to consumers for light and power.

ST. MARLEBORNE.—The estimated revenue of the electricity undertaking for the year ending March, 1917, is as follows:—From sales of electricity to consumers, £180,975; from public lighting, £14,970; meter rents, £7,800; sale of fittings, &c., £10,285; rent of properties, plant on hire, and sundry charges, £4,765, making a total of £218,795. The estimated expenditure is, for generation and distribution costs, management expenses, rates, taxes, &c., £81,110; allowances to employés, £5,050; maintenance and repairs to public lamps and repairs to properties, £3,800; sales department, £9,955; repayment of loans, £47,440; interest, £68,507, making a total of £215,862, and leaving an estimated credit balance on the year's working of £2,933. During the new year a short-term loan will be liquidated, resulting in a reduction of £4,581 in interest and sinking fund charges.

Maidenhead.—**PRICE INCREASE, &c.**—The T.C. has decided to increase the price of current for lighting by 1½d. per unit, and for power by 10 per cent. A long dispute with the Diesel Engine Co., Ltd., who claimed a sum of £365, has been settled by payment to the liquidator of £128.

Malton.—**PRICE INCREASE.**—The Northern Counties Electric Supply Co. has informed the Urban Council that from April 10th the charge for electricity supplied to the Council will be increased by 20 per cent. The company has agreed to consider an application by the Council for an abatement in the lighting contract for the past year owing to restricted lighting.

Manchester.—The Electricity Committee has given permission to the city electrical engineer (Mr. S. L. Pearce) to advise the boroughs of Rochdale, Chesterfield, and Stafford, on their respective electricity undertakings.

Mr. Ross Clyne has given notice of intention to move a resolution at this week's meeting of the City Council, regretting that a request made to the Electricity Committee for large supplies of current by a firm proposing to establish works in Manchester, was not brought before the Committee as a whole, for consideration as to possible ways and means to meet the demand in question. The resolution proceeds to urge that in future all proposals, offers, or requests of like importance shall be properly submitted to the discretion of the Committee before acceptance or refusal.

Navan (Co. Meath).—At a meeting of the Guardians, Mr. J. Kelly referred to what he regarded as the Urban Council's undue delay with regard to the electric lighting scheme. It was now some years, he said, since a provisional order was obtained, and if it was not put in force in a few months, it would lapse.

Newport (I. of W.).—**PRICE INCREASE.**—The Electric Light Co. has informed consumers that the price of energy for lighting will be increased by 15 per cent., and for power by 10 per cent. after the current quarter.

Northwich.—**PRICE INCREASE.**—The Northwich Electric Supply Co., Ltd., has given notice that in consequence of the increased cost of materials and labour, the charges for electricity will be increased 10 per cent. from July 1st.

Reigate.—**PRICE INCREASE.**—The T.C. has decided to increase by 15 per cent. the charges for lighting and power, and to raise the price for heating from 1d. to 1½d. per unit, plus 15 per cent., as from April 1st.

Salford.—Electric current is to be supplied free of charge to local hospitals under the control of the British Red Cross Society.

The Electricity Committee recommends the T.C. to authorise the cost of the proposed sub-station in the Greengate District to be defrayed out of moneys to be obtained from the sale of low-tension cables which will fall into disuse, the balance to be credited to capital account. The Committee proposes to enter into an agreement with the Peel-Connor Telephone Co., for the supply of energy for a period up to 10 years.

Stoke-on-Trent.—The T.C. has instructed the engineer to report as to the present plant in the power house, and upon what lines it is desirable that extensions shall be made, together with the probable cost.

Wirksworth.—**PROPOSED E.L.**—In reply to an inquiry from Mr. C. H. Best, of Bradford, as to the possibility of making preliminary arrangements for supplying the town with electric light and power, the U.D.C. has decided that it is undesirable to proceed with the matter at present.

Wimbledon.—**PRICE INCREASE.**—The T.C. has decided, as from April 1st, to increase the price of energy supplied in the borough, and at Merton and Maldens and Coombe by 10 per cent. A similar increase has been made for the hire of meters.

TRAMWAY and RAILWAY NOTES.

Dundee.—**YEAR'S WORKING.**—The revenue from the Corporation tramways for the year shows an increase of £3,800, but the expenditure is greater by about the same amount.

Ilford.—**PROPOSED FARE REVISION.**—In view of the increased running expenses, and the present prosperity of the town, the tramway manager has advised his Committee to consider the question of adopting the penny universal fare, and suggests that the scheme should be put into operation for the period of the war.

Leeds.—At a meeting of the City Council last week, Ald. C. H. Wilson (chairman of the Finance Committee) stated that the profits made on the tramway undertaking last year amounted to £91,000; £20,000 of this sum, however, represented money which would have been spent on track renewal but for the war, and £15,000 of it was to be put in reserve. He had anticipated that the profits from the tramways for the ensuing year would be £70,000, as against the Committee's estimate of £55,000, and if they could secure drivers for the cars there was little doubt that this year's figure would be exceeded at the end of the next 12 months, because, money being plentiful in the city, people would not walk.

Leicester.—**YEAR'S WORKING.**—The total revenue of the tramway department for the year to December 31st last, was £188,520, as compared with £170,235 for the previous year. The working expense, £122,142, increased by a less amount, leaving a gross balance of £66,733, as against £53,288 in 1914. After meeting interest, sinking fund charges, &c., and war allowances amounting to £7,412, the net balance remaining was £11,961, as against £11,221 in 1914, when war allowances were on a much smaller scale. It is recommended to appropriate £8,000 of the balance for rate relief, and £2,757 for reserve; the reserve fund in hand amounts to £93,797. During the year 40,440,158, being an increase of 2½ millions on the previous year, although the car-mileage, 3,899,939 miles, shows a reduction of 237,000 miles. The improved receipts were partly due to increased fares charged. At the end of the year 67 women conductors were employed on the cars.

Leyton.—The Tramways Committee recommends the carrying out of various repair, &c., works at the depot, at a total cost of £160.

London.—The L.C.C. Housing Committee having proposed to make representations to the B. of T. on the inconvenience that would arise to the working classes from the closing of certain South London railway stations, the Highways Committee points out that the workmen's traffic at most of these stations is negligible, and that arrangements have been made by the tramway authorities to cope with any additional passengers resulting from the withdrawal of railway facilities.

Northampton.—The T.C. has been recommended to instruct the borough engineer to re-lay the curved tramway tracks in Mercer's Row and Abington Street.

U.S.A.—**EXTRA-HIGH-PRESSURE TURBINES.**—As previously mentioned in this journal, the Boston Elevated Railway has decided, in order to meet the growth of the load up to 1920, to install a 35,000-kw. steam turbine unit and to add 4,000-kw. rotary converters to its sub-station plant. The decision resulted from the relatively low first cost per kw. and superior economy

of the large turbine over a 20,000-kw. unit which had been originally proposed. A feature of great interest is the decision to use a steam pressure of 600 lb. for which pressure future boiler plant will be built. The present South Boston plant operates on steam at 200 lb. pressure, and the new set will utilise the present boiler plant to commence with, being designed for the addition of probably six stages to the 16 stages considered necessary with the existing pressure. These extra stages will form either an extension of the turbine casing or a separate high pressure section on the same shaft.

Regarding the use of high pressures, Messrs. Stone & Webster's engineers pointed out that the art of steam generation has reached a point where manufacturers consider it entirely practicable to build reliable equipment for operation at pressures ranging from 400 lb. to 600 lb., and that it seems probable that such equipment will be demanded by the best practice within a few years. The company cannot take advantage of these pressures yet, but the additional cost of a 35,000-kw. turbine designed for double the ordinary pressure is given as only about \$15,000. The estimated saving of a 35,000-kw. unit over a 20,000-kw. unit, on a five-year period beginning 1917, using 200-lb. steam, based on 1,180,000,000 kw.-hours is \$200,000, which covers the additional cost of the larger machine. The cost of adding the 35,000-kw. set, exclusive of engineering and fixed charges, will be \$690,150, this including building, foundations, piping, exciter, ducts, an air-washer, switch-gear, &c., as well as the turbine unit (which is figured at \$315,000).

The South Boston station supplies 11 sub-stations, with 20 rotary converters, having an aggregate capacity of 41,000 kw. The 4,000-kw. rotary unit is to be adopted for future extensions in the central section of the city, since this not only reduces the cost and number of new sub-stations, but permits of the economical increase in capacity of existing sub-stations, whose 2,000-kw. machines can be used to advantage in the outlying districts.—*Elec. Railway Journal.*

BATTERY CAR OPERATION.—The Cambridge and Indiana Railroad's 50-ft., 30-ton Edison battery car, during recent runs amounting to 738 miles, showed a total cost for platform labour and electric power, amounting to 13½ cents per mile. Electrical energy cost \$35.4 at 2 cents per kw.-hour. The company has just ordered another similar car, 35 ft. 8 in. long, equipped with 165 Edison A 10 cells and four Westinghouse motors.

TELEGRAPH and TELEPHONE NOTES.

Australia.—The Eastern and Associated Telegraph Companies will shortly open their own public office in Melbourne, Australia, which will be connected by special wire with their direct cable system.

Glasgow.—The special committee of the Corporation which deals with telephone affairs has recommended the T.C. to protest against the manner in which the charges for unlimited telephone service have been increased, without affording subscribers an opportunity to make representations against them, and to inform the P.M.G. that the Corporation reserves the right to take steps after the war, with a view to the modification of the charges and the amendment of the other conditions of service.

Norway.—At the end of June, 1914, the Government telegraphs and telephones possessed in the aggregate 220,443 km. of wire and 22,674 km. of line; the bulk of the wire was installed for telephone subscribers' exchange connections, amounting to 129,690 km., while the trunk lines employed 67,713 km. The telephone system of Christiania claimed no less than 91,658 km. of wire, and the 72 State telephone exchanges had a total of 36,377 subscribers' stations. There were 104 million conversations during the year. Private telephone companies, numbering 330 in 1912, had 37,211 subscribers and transmitted 84 million messages, the revenue being over two million francs.—*Journal Télégraphique.*

Post Office Telegraphs and Telephones.—The report of the P.M.G. for 1914-15 was recently issued in the form of a blue-book. It states that the number of telegraph offices open at the end of March, 1915, was 14,222, an increase of 70; the number of telegrams handled was 91,179,000, an increase of over 4 millions, including over 3 million free Government telegrams more than in the previous year, and the receipts increased by £193,092 to £3,013,909. The military and naval traffic was extremely heavy, and Press telegrams increased by 6 per cent. The withdrawal of a large portion of the staff for military or naval service necessitated the employment of temporary staff, the training of additional operators, the recall of retired operators, and the use of the telephone in place of the Morse sounder at 7,350 sub-offices. The use of Creed high-speed printing telegraph machines set free a number of telegraphists, and a Western Electric multiplex was added on the London-Manchester route, on which the Murray instrument was already in use. Baudot working was extended, and the use of the Wheatstone was increased. The use of the telephone system for the dispatch and delivery of telegrams was found of great assistance, and the trunk telephone lines were also used for the delivery of urgent telegrams at night. The extended use of phantom telegraph circuits superposed on telephone trunk and junction circuits proved valuable. Foreign telegrams (apart from the cable companies' traffic) numbered 9,421,000, a decrease

of over two millions. At the outbreak of war there were 2,158 licences in existence for private wireless stations on land, an increase of 195; no fresh licences were issued, and the existing stations were dismantled. At the end of July, 1914, 942 merchant ships carried wireless apparatus under licence from the P.M.G., an increase of 63 during the four months; in that period 26,145 radiotelegrams were dealt with at the P.O. Coast stations.

The number of telephones owned by the Post Office (apart from military and naval telephones) was 749,565, besides 46,782 private-wire stations. Nearly 10,000 emergency circuits were provided specially for Government departments. The exchange telephones in London numbered 253,436. The number of effective calls during the year was 815 millions, a decrease of 23 per cent. New exchanges opened numbered 232, making the total 3,052. Trunk calls increased by 6·89 per cent., and 570 additional trunk circuits were provided, or 40,727 miles of wire. At 34 towns the separate trunk and local exchanges were amalgamated, with advantage, and new underground telephone cables have been laid and brought into use. An accelerated trunk service was introduced between Bradford and Leeds. Automatic exchanges were working satisfactorily at the G.P.O., Accrington, Chepstow, Darlington, Epsom, Hereford, and Newport, and similar exchanges were being installed at Blackburn, Dudley, Grimsby, Leeds, Paisley, and Portsmouth. Only 357 exchanges now do not give a continuous service. The number of rural party lines (farmers' lines) was increased by 849 to 2,265. Some 7½ million telegrams were sent by telephone, an increase of 13·4 per cent.

The mileage of wire in use was 3,071,867 miles, an increase of 6·4 per cent.; of the total, 265,765 miles were used for telegraphs and 2,806,102 for telephones. Aerial wires aggregated 997,292 miles, underground 2,060,918 miles, and submarine 13,657 miles.

Urgent demands for stores for military and naval purposes were dealt with on the outbreak of war; in one case material weighing over 100 tons was assembled and dispatched within 24 hours of the receipt of the demand. Some 16,000 telegraph and telephone instruments were issued for naval or military purposes during the year. The whole of the initial equipment for the base and field post-offices of the Expeditionary Force, weighing about 10 tons, was dispatched within two hours of the receipt of instructions. Owing to the rise in price of foreign timber, 44,000 British-grown poles were ordered.

The financial results of the working of the telegraphs and telephones were briefly as follows:—

	Revenue.	Increase.	Expenditure.	Increase.
Telegraph ...	£3,407,326	£286,813	£4,656,607	£324,352
Telephone ...	6,481,827	290,643	6,588,869	636,796

The telegraphs showed a net loss of £1,249,281, and the telephones a net loss of £107,042.

Part of the deficiency on the telegraphs was due to the use of the Continental cables for war purposes, and to an expenditure of £98,884 in wages to employés serving with the Colours. Similarly the telephone cables to the Continent had been used for war purposes, and £80,802 was paid in respect of telephone employés serving with the Colours.

Uruguay.—The Government has obtained statutory powers to take control of the telegraph, telephone, and post-office services, and will entirely reorganise them as soon as arrangements can be made to take them over from the present owners.—*T. and T. Age.*

Wireless Inventions.—It is reported that Senator Marconi has been engaged upon research work in Italy, and has obtained results which concern the future practice of the whole science of wireless telegraphy and telephony; patents are being applied for. The inventions will probably be applied at once in Italy to military purposes, and it is expected that by these means results heretofore impossible will be obtained.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—**SYDNEY.**—May 1st. Two 300-kw. turbo-alternators, condensers, switchboard, &c., for the pumping station at Ryde, for the Metropolitan Board of Water Supply and Sewerage at Sydney.

May 3rd. N.S.W. Railways and Tramways Department. One 2,500-kw. turbo-alternator, for Zara Street, Newcastle, power house. Specifications (20s.) from the Engineer's office, 61, Hunter Street, Sydney.

May 24th. N.S.W. Government Railways and Tramways. 16/600-volt D.C. motors for tramway stores, Randwick.*

ADELAIDE.—April 12th. P.M.G. Ten to eleven miles of lead-covered cable.*

MELBOURNE.—April 11th. City Council. 533,000 arc lamp carbons. See "Official Notices" March 25th.

April 18th. P.M.G. 8,500 fuses.*

April 26th. Victorian Government Railways. Car-lighting material—cables, switches, fuses, &c.*

May 1st. City Council. Meters and maximum demand indicators. See "Official Notices" to-day.

May 10th. Victorian Government Railways. Motor-generator set and accessories for battery-charging of baggage trucks.*

May 17th. Victorian Government Railways. One 2-ton electrically-operated goods elevator for Jolimont car-shed.*

TAMWORTH (N.S.W.).—May 1st. Additional generating plant, switchboard, mains, &c., in connection with the municipal electricity undertaking. Specifications from Mr. V. G. Kable, Town Clerk, Council Chambers.

Salford.—April 17th. Electricity Committee. Switch-gear for 5,000-kw. sub-station equipment. See "Official Notices" to-day.

Walthamstow.—April 26th. U.D.C. Water-softening plant for the Electricity Department. See "Official Notices" to-day.

Warrington.—April 11th. Electricity and Tramway Committee. Motors and transformers. See "Official Notices" March 31st.

April 26th. Electricity and Tramways Committee. Boiler plant and economiser. See "Official Notices" to-day.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Barrow.—The T.C. has accepted the following contracts for electricity supplies for 12 months:—

Copper wire, &c.—A. F. Goodwin & Co.
Insulating compound and bitumen.—Dussek Bitumen Co.
Switches, &c.—General Electric Co., Ltd.
Joint-boxes and switch cut-outs.—B.I. & Helsby Cables, Ltd.
Electricity meters.—Chamberlain & Hookham, Ltd.
Prepayment meters.—Ferranti, Ltd.
Metallic filament (Osram) and tantalum lamps.—Drake & Gorham, Ltd.
Carbon filament lamps (Pope's).—Pope's Electric Lamp Co., Ltd.
Earthenware pipes and troughs.—Doulton & Co., Ltd.
Electric motors.—Verity, Ltd.
Meter boards.—E. Cust.
Bricks.—Furness Brick & Tile Co., Ltd.
Engines and crank-chamber oils.—Vacuum Oil Co., Ltd.
Cylinders and turbine oils.—Jas. Light & Sons, Ltd.
Ash-elevating plant, £219.—The New Conveyor Co.
Oil-eliminating plant (additions), £105.—Paterson Engineering Co.

Newport.—Messrs. Chamberlain & Hookham, Ltd., have received a contract for meters for the coming year for Newport.

Bexhill-on-Sea.—T.C. 500 tons of Shipley or Tibshelf peas coal, for the electricity works: Myers, Rose & Co., £1 8s. 9d. per ton.

Bolton.—The following tenders have been accepted by the Electricity Committee:—

Bolton Brick Co.—Trough covers.
J. & F. Webster.—Casings, &c.

Derby.—T.C. Coal for the electricity works: Derby Coal Co., Ltd., Hill & Poyser, T. Walker, and Brookhouse, Johnson, Ltd.

Dudley.—The Lighting Committee recommends the Corporation to accept the tender of the Earl of Dudley for a 12 months' supply of steam coal, at 22s. per ton.

Halifax.—The T.C. has been recommended to purchase from the Brompton & Kensington Accessories Co., Ltd., the electric cooker now on approval at the electricity works, and to accept the following tenders:—

Edison Accumulators, Ltd.—A standard 2-ton Edison chassis, complete with electrical tip body, for removing ashes from the electricity works, for £377.
Daimler Co., Ltd.—Two 3-ton Daimler chassis, for the Tramways Committee, £1,483.

Hford.—Messrs. E. Foster & Co. are to supply one truck weekly, over a period of six months, of Hawkins' nutty slack, at 20s. 6d. per ton, to the Electricity Committee.

Kingston-on-Thames.—The Committee proposes to seal contracts with W. Cory & Sons, Ltd., and Usher & Co., for the supply of 500 tons of Lambton coal at 37s. 6d. per ton, and 300 tons Shipley ½-in. slack, at 22s. 6d. per ton respectively.

Lancaster.—Corporation Electricity and Tramways Committee. Tenders accepted for four motor-buses: Edison Co. for the chassis, and Brush Co. for the bodies.

Leyton.—The tender of Messrs. Siemens Bros., Ltd., has been accepted by the U.D.C., at £172, for 2½ miles of service line cable (several sizes).

London.—The Metropolitan Water Board does not propose to enter into a periodical contract this year for the supply of electric lamps, wire, and accessories (sub-sections 1, 2 and 3). Instead, it has been suggested that the Works Committee should obtain tenders from time to time for the supply of such quantities as may be required during the period ending March 31st next.

The Metropolitan Asylums Board proposes to renew the contract with the Pritchett & Gold Co. for the maintenance of the electric battery at the Grove Hospital for a further period of five years, at £75 per annum.

L.C.C.—The Education Committee recommends that the chairman, vice-chairman and deputy-chairman of the Council, the chairman and vice-chairman of the Education Committee, and the chairman and vice-chairman of the Buildings Sub-Committee be authorised, during the Easter recess, 1916, to open the tenders received for installing electric light at the Southampton Street, Camberwell, L.C.C. school.

The Asylums and Deficiency Committee has accepted the following tenders for the supply of the under-mentioned stores for three months—

Electrical sundries.—A. F. Goodwin & Co.; General Electric Co., Ltd.; Cox-Walkers, Ltd.; Edison & Swan U.E.L. Co., Ltd.; G. MacLellan and Co.

Electric lamps.—Poppe's Electric Lamp Co., Ltd.

Manchester.—The Electricity Committee has approved the following firms as sub-contractors in connection with the tender of M. Luni-Prat (Paris) for induced-draught plant:—

Chimney, J. Danks & Co., Dinsbury, Ltd.
Electrical materials, Lowmoule Dynamo & Motor Co., Ltd.
Foundation base.—Gals. Bros.

Midland Railway Co.—The recent reference to a contract for Osram lamps placed with the General Electric Co., Ltd., by the Midland Railway Co., was not intended to indicate that the contract for the exclusive supply of metal-filament lamps was given to that company. The order only covers a portion of the railway's requirements.

Morden.—Joint Hospital Board. Electric light maintenance (not including armature and field coil failures): D. J. Macdonald, Hounslow, £22 for the year.

Salford.—The Tramways Committee has accepted the tender of Messrs. Scholey & Co., Ltd., for steel tramway tires, amounting to approximately 1,055. The Electricity Committee has accepted the tender of Messrs. Babcock & Wilcox, Ltd., for two water-tube boilers, &c., for £11,544.

The following tenders have been accepted by the Tramways Committee for supplies:—

Car accessories (electrical), insulating materials, &c.—W. McGeach & Co., Ltd.; W. T. Hanley's Telegraph Works, Ltd.; General Electric Co., Ltd.; L. Andrew & Co.; British Westinghouse Co.; Micaite and Insulators, Ltd.; North British Rubber Co., Ltd.; Griffiths Bros., Ltd.; insulating varnishes: C. Macintosh & Co., Ltd.; B.I. & Helsby Cables, Ltd. (B and E tape); Siemens Bros. Dynamo Works, Ltd.; Le Carbone; H. Norbury & Co.; Gabriel & Co., Ltd.; W. Boydell and Sons, Ltd.; J. Hall.

Car accessories (mechanical).—W. J. Ritchie & Co.; National Rail and Tramway Appliances Co., Ltd.; J. Snedham & Sons, Ltd.; Anti-Attrition Metal Co., Ltd.; Brown, Bayley's Steel Works, Ltd. (steel tires).

Ears, gongs, pull-offs, &c.—B.I. & Helsby Cables, Ltd.; Watlington & Co., Ltd.; J. Hall; British Westinghouse Co., Ltd. (lighting arresters).
Special car accessories.—British Westinghouse Co., list prices.
Wire, solder, lead and tin.—B.I. & Helsby Cables, Ltd.; L. Andrew & Co.; R. Johnson, Clapham & Morris, Ltd.

The following tenders have been accepted by the Electricity Committee:—

British Westinghouse Co.—Two 1,000-kw. rotary converters, £5,500.
General Electric Co., Ltd.—One 500-kw. rotary converter, £1,560.
Babcock & Wilcox, Ltd.—Two water-tube boilers, £11,544.

York.—T.C. Coal for the electric light works: Mr. G. Cooper (Bentley Colliery Co.), at 16s. per ton.

FORTHCOMING EVENTS.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, April 7th. At 7.30 p.m. At the Literary and Philosophical Society, Westgate Road, Newcastle. Address on "The Business Side of Science: Its Part in the Coming Economic Crisis," by Mr. T. C. Elder.

Royal Institution of Great Britain.—Saturdays, April 8th and 15th. At 3 p.m. At Albemarle Street, W. Lectures (V and VI) on "Radiations from Atoms and Electrons," by Prof. Sir J. J. Thomson.

Friday, April 14th. At 5.30 p.m. At Albemarle Street, W. Lecture on "The Genesis and Absorption of X-Rays," by Prof. Sir J. J. Thomson.

North of England Institute of Mining and Mechanical Engineers.—Saturday, April 8th. At 2 p.m. At the Wood Memorial Hall, Newcastle-on-Tyne. General meeting.

Salford Technical and Engineering Association.—Saturday, April 8th. At 7 p.m. At Salford Technical Institute. Lecture on "British Design Modern Cylindrical Grinding Machines, External and Internal," by Mr. T. R. Shaw.

Junior Institution of Engineers (Midland Section).—Tuesday, April 11th. At 7.30 p.m. At the Imperial Hotel, Temple Street, Birmingham. Paper on "Application of Chain Gear for Power Transmission," by Mr. C. Turtle.

Association of Engineers in Charge.—Wednesday, April 12th. At St. Beale's Institute, E.C. At 7.30 p.m. Paper on "Steam Turbines," by Mr. G. Somers.

Dynamicables' Anniversary Meeting and Dinner.—Wednesday, April 12th. At 7.30 p.m. At the Trocadero Restaurant. Mr. C. P. Sparks in the chair.

Liverpool Engineering Society.—Wednesday, April 12th. At the Royal Institution, Crompton Street. Paper on "Electric Power in Quarry Operation," by Mr. G. K. Paton.

Institution of Electrical Engineers.—Thursday, April 13th. At 8 p.m. At the Philosophical Hall, Leeds. Discussion on "The Present Position of Electricity Supply in the United Kingdom, and the steps to be taken to Improve and Strengthen it."

Newcastle Local Section.—Monday, April 10th. At 7.30 p.m. At the Mining Institute. Paper on "The Nature of Electrical Insulation," by Mr. W. M. Thornton.

Scottish Local Section.—Tuesday, April 11th. At 8 p.m. At 207, Bath Street, Glasgow. Paper on "Branches from R.R. Circuits," by Mr. D. M. MacLeod.

(Yorkshire Local Section).—Wednesday, April 12th. At 7 p.m. At the Philosophical Hall, Leeds. Paper on "Electric Heating: Its Present Position and Future Development," by Mr. G. Wilkinson.

Leeds Association of Engineers.—Thursday, April 13th. At 7.30 p.m. At 5, Park Lane. Annual meeting.

Institution of Mechanical Engineers.—Friday, April 14th. At 6 p.m. At the Institution of Civil Engineers, Great George Street, S.W. General meeting.

NOTES.

Easter Holidays.—Owing to the Easter Holidays, the ELECTRICAL REVIEW for Friday, April 21st, will be published on Wednesday, April 19th. All matter for both the editorial and advertisement pages for that issue should be in our hands at the earliest possible moment. A notice regarding the latest times for advertisements to be received, appears in our advertisement pages to-day.

Lost Time.—In the Belfast Munitions Court, two young electricians named Robert Sanderson and James Mawhirk were charged with absenting themselves from work. It was stated that during the nine weeks from January 20th to March 22nd, Sanderson lost 34 per cent. of his time and Mawhirk 33 per cent. Sanderson, who did not appear, was fined 40s., and Mawhirk 20s.

Electrical Output of U.S. Power Stations.—A table published in the *Electrical World* gives statistics relating to the output, load factor, &c., of the 36 largest electrical generating systems of the United States, which produce about 70 per cent. of the aggregate output of the country. The combined output of these companies in 1915 was 13,000 million kw.-hours, of which about two-thirds was generated by water-power. The Commonwealth Edison Co. produced 1,198 million units, with a load factor of 42.5 per cent. for the year. The Niagara Falls Power Co. produced 899 millions, with a load factor of 81.28 per cent., and three other companies exceeded 725 millions. The Hydraulic Power Co., which produced 695 millions, recorded the remarkable load factor of 91 per cent., the bulk of the energy being used in electro-chemical industries. Only two of the companies had an output of less than 100 million units.

London and Frankfurt Metal Interests.—It is stated on good authority that, with the consent of the German and English Governments, a dissolution is to take place of the relations hitherto existing between the Metall Bank and Metallurgische Gesellschaft and the Metallgesellschaft of Frankfurt-on-Main, on the one hand, and Henry R. Merton & Co., Ltd., of London, on the other, in the sense that both sides will completely dispose of their mutual shareholdings. Certain formalities with English executors have to be settled before the transaction can be definitely completed. In this connection it is mentioned that of the ordinary shares in the London company the sum of £150,000 was in the possession of the Metall Bank and £180,000 in that of the Metallgesellschaft, these having been disposed of in London, together with shares for £20,000 which were in private ownership. In return large blocks of shares in the Metallgesellschaft, the Metall Bank and the Schweizerische Gesellschaft für Metallwerke have been sold in Germany out of the holdings of persons who are closely associated with the firm of Henry Merton & Co. The sale price of the latter has ranged from 200 per cent. to 270 per cent. It is added that the incentive to the dissolution of relationship emanated from London.

I.M.E.A. Annual Meeting.—The 21st annual general and business meetings of the Municipal Electrical Association will be held at the Institution of Electrical Engineers, London (as headquarters), on June 22nd and 23rd next. The first day's proceedings include the reading of the presidential address by Mr. Alex. C. Cramb, Croydon, this year's president, followed by the reading and discussion of three papers as follows:—

"Boiler House Design," by Mr. W. W. Lackie, Glasgow.

"Area of Supply from an Economic Standpoint," by Mr. H. S. Ellis, South Shields.

"The Application of Electric Power to Agriculture," by Mr. W. T. Kerr, Hereford.

The second day's proceedings will be confined to the morning, when the annual business meeting will be held. No special arrangements will be made in regard to hotel accommodation or travelling facilities. The secretary is Mr. C. McArthur Butler, 28, Bedford Square, W.C., to whom communications should be addressed.

Petrograd Electricity Plans.—The Petrograd Town Council has appointed a special committee for establishing a basis for buying back the electrical concerns of the capital. The committee is working under the chairmanship of Town Councillor A. A. Voronoff, and is preparing a general plan for uniting various electrical concerns, having in view their reconstruction and further exploitation. It is also preparing an estimate and system of charges for current, and so on. It is said that the committee promises that electricity shall be much cheaper for the consumers than it was before. The estimated cost of the operations of the committee, which it is hoped will be closed in the year 1918, is about 518,000 roubles.

Tungsten Deposits in Burmah.—According to the *Mining and Engineering World*, the first serious attempts to develop the Wolfram deposits of the Indian Empire and Lower Burmah occurred about 5 years ago. During 1909-13 Lower Burmah produced over 5,000 tons of concentrates valued at nearly £400,000, and the present rate of production is about 2,000 tons. The methods adopted in mining are extremely primitive; open quarries, hand crushing of the ore are usual; the labourers are largely Chinese and Telegus. It is now announced that the Indian Government is taking energetic steps to stimulate the output.

Inquiries.—Firms that stamp out steriliser bodies are inquired for; also makers of paper rolls for recording voltmeters and makers of an assaying apparatus, using an electric current to deposit the metal under test.

Institution and Lecture Notes.—Institution of Electrical Engineers.—The Committee of the BIRMINGHAM LOCAL SECTION has had under very careful consideration the question of alien enemy membership, which is at present before the Institution, and, after a full discussion of the matter at two meetings, unanimously passed the following resolutions for transmission to the Council of the Institution:—

1. That the Council be requested to obtain powers to amend the Articles of Association to exclude from membership of the Institution any undesirable aliens or undesirable members of alien origin.

2. That, in view of the foregoing resolution, it is not considered necessary to proceed with the resolutions at present before the Institution.

The Committee has prepared the following list of officers to act during the Session 1916-17:—

Chairman.—Col. J. F. Lister, R.E.
Vice-Chairmen.—S. T. Allen, N. B. Roebor.
Present Ordinary Members of Committee (remaining in office).—H. Foulds, C. C. Garrard, Ph.D., S. H. Holden, W. A. Jackson, Prof. G. Kapp, D. Eng., W. Marden, A. Pearson, B.A., W. E. Sampner, D.Sc., F. Thursfield, J. M. Walshe.

Ordinary Members of Committee (new nominations).—F. H. Cough, T. Plummer, E. O. Turner.

Hon. Secretary.—J. D. Morgan.

The Committee's nominations are given in italics. Additional nominations must reach the Hon. Secretary, at 13, Temple Street, not later than April 12th.

The annual general meeting of the MANCHESTER LOCAL SECTION was held on Tuesday last. The chairman (Mr. B. Welbourn) presided, and there was a good attendance of members.

The ballot for the election of chairman, hon. secretary, and Committee for the next session resulted as follows:—

Chairman.—Mr. A. E. McKenzie.
Vice-chairman.—Messrs. C. J. Beaver and A. P. M. Fleming.
Committee.—Prof. Field and Miles Walker, Dr. Cramp, Messrs. H. Allcock, A. G. Livesay, S. L. Pearce, J. S. Peck, H. A. Ratcliff, J. A. Robertson, H. D. Symonds, S. J. Watson, and Alderman Walker.

At the close of the meeting a lecture on "Recent Researches in X-Rays" was given by Prof. E. Rutherford, of the Manchester University.

The report states that the number of members at the close of the Session was 735, a slight increase over the figures for last year. The attendance has averaged slightly over 100 per meeting, which would be a good figure for ordinary times, and under present conditions must be considered exceptionally good. In the discussions upon the various papers, a very high general level has been attained, and an unusual number of new speakers has taken part.

Royal Institution.—The Day Lectures after Easter include the following:—Prof. T. M. Lowry, two lectures, "Optical Research and Chemical Progress"; Prof. W. H. Bragg, two lectures on X-Rays and Crystals: (1) "New Methods of Research"; (2) "First Results and their Applications" (the Tyndall Lectures); Prof. H. S. Foxwell, two lectures, "The Finance of the Great War: New Problems and New Solutions"; "How we Stand To-day, and What Lies Ahead." The Friday evening discourses will be resumed on May 5th, and will include the following:—Sir James Mackenzie Davidson, "Electrical Methods in Surgical Advance"; Prof. Charles G. Barkla, "X-Rays."

Junior Institution of Engineers.—The meeting at which a paper on "Speeding-up," by Mr. R. Rankin, is to be read, has been postponed from the 10th to the 18th April.

In an address before the DUBLIN ROTARY CLUB, Sir John Griffith, late engineer to the Dublin Port and Docks Board, suggested the extension of the electrical equipment of the Port for the rapid discharge of vessels.

Fire Prevention.—The British Fire Prevention Committee's fire warnings, which have been issued since the outbreak of war, cover a number of matters that require the attention of the public with the object of reducing the ordinary fire waste and meeting the air raid danger. The public are advised to apply for the particular class of notice or warning that they desire. These are provided gratuitously. The warning for factories and works engaged on Government contracts is No. 16. For the air-raid danger, warnings Nos. 17A and 18A should be obtained. No warning notice is issued to any caller at the Committee's offices or testing-station, or upon any telephone message. Application must be made in writing, with a large stamped and addressed envelope enclosed for the reply, to the Registrar, The British Fire Prevention Committee, 8, Waterloo Place, London, S.W., and both the nature of the notice and the reference number of the warning (as given above) must be given.

Nickel-Chromium Patents in the U.S.A.—A list of the licensees under the Marsh patent, No. 811,850, for the use of nickel-chromium wire as a resistance element in electric heating apparatus, was published in the *Electrical World* of March 4th. The patent is owned by the Hoskins Manufacturing Co. and the General Electric Co.—the parties in the recent infringement case, reported in our issue of July 30th, 1915, in which the latter company was the loser. The General Electric Co. has acquired a third interest in the patent. An advance in the prices of heating appliances is anticipated. The owners do not intend to take proceedings against firms that have used infringing devices in the past, provided that they deal with the owners or their licensees in future, and do not deal in infringing devices. The Driver-Harris Wire Co., who manufacture nichrome wire, are in conference with the owners of the patent.

Fatalities.—At Failsworth last Friday an inquest was held into the death of Edward Capewell (48), who, together with another man, was employed at the works of Messrs. Ferranti, Ltd., Hollinwood. They were lifting a carboy of nitric acid from a trolley on to the floor when it burst and the liquid ran on to some brass castings and fired. Despite medical aid Capewell died later. The foreman, who was still suffering from the effects of the fumes, would not be able to attend the inquiry for some days. The inquest was adjourned.

An Openshaw electrical engineer, Arthur Fletcher, aged 45, employed at the Armstrong, Whitworth works was knocked down by a Manchester Corporation tramcar last week and killed. Verdict: "Accidental death."

Electrical Instrument Makers Wanted.—The Wireless Section of the Corps of Royal Engineers is open to recruit first-class instrument (electrical) makers. Conditions as to pay, terms of service, &c., can be obtained by application to M-jor A. Handley, R.E., St. Martin's Gate, Worcester. Applicants should state fully their training and experience, and say if they are eligible for service.

Volunteer Notes.—ENGINEERING INSTITUTIONS' V.E.C.—Orders for week commencing April 10th, 1916.—By Lieut.-Col. Clay, V.D., Commanding.

Monday, April 10th.—Sections 1 and 2, Technical; Sections 3 and 4, Squad and Platoon, Signalling Class and Recruits.

Tuesday, April 11th.—School of Arms, 6 to 7 p.m.

Thursday, April 13th.—Shooting for Sections 3 and 4.

Friday, April 14th.—Sections 3 and 4, Technical; Sections 1 and 2, Squad and Platoon, Signalling Class and Recruits.

Saturday, April 15th.—Adjutant's Instruction Class at 2.30 p.m.

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BOYS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, April 6th, 1916:—

Battalion Parades.—Saturday.—The Battalion will Parade outside Baker Street Station at 2.30 p.m., and proceed by train to Wembley Park, for Battalion Drill, under the Commandant.

Sunday.—The Battalion will Parade at Liverpool Street Station (low level entrance, G.E.R.), at 9.30 a.m., and proceed by train for Entrenching duties.

Musketry.—There will be shooting at Bisley on Saturday next, 8th inst., and all day Sunday, 9th inst. Members proceeding to Bisley on Saturday, must Parade, in uniform, at 12.45 p.m., No. 6 Platform, Waterloo Station, and members going down on Sunday, at 9.45 a.m., No. 6 Platform.

The Action Range will be open on Saturday, 8th inst., at 2 p.m.

Names (for both Ranges) must be forwarded to the Musketry Staff by first post Saturday morning.

A. G. JOINER, Major and Adjutant, O.B.C.

The Electrification of Fibres.—Arrangements are being made for setting on foot a thorough scientific investigation into the question of the electrification of fibres in the textile industry, a phenomenon which has given a great deal of trouble to manufacturers. The Textile Institute, at the instance of the Mill Managers' Association, has requested the Leeds University to take the research in hand, the cost being borne by the Institute, with the assistance of the manufacturers.

Registration of Firms.—With reference to the subject of our leading article of last week, we regret to state that in the House of Commons, last Friday, Mr. Lloyd George, in reply to Mr. Annan Bryce, said that as there was reason to believe that the Registration of Firms Bill would not be accepted as a non-contentious measure, the Government was not, as at present advised, prepared to proceed with the Bill in the Commons.

Electric Light Switching.—At the end of this month the results of the competition just closed will be published in this journal. Meanwhile, we are asked by Messrs. A. P. Lundberg and Sons to announce the fact that, owing to the success of this competition, a supplementary examination will be conducted shortly on the same sets of problems. Particulars will be issued to old and intending new competitors early this month. Those who have a copy of the February Examination Pamphlet should keep it by them; those who have not, can obtain one on application within the next three weeks.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—The L.C.C. Highways Committee recommends that, during the absence through illness of the chief officer of tramways, the deputy chief officer of tramways, Mr. J. K. BRUCE, shall take the place of Mr. A.

L. C. FELL as one of the representatives of the Council on the Rolling Stock and the Permanent Way and Building Conciliation Boards.

On the occasion of his marriage with Miss H. Moon, Mr. THOS. LAW, of the Rotherham Corporation Tramway staff, has been presented by the shed staff with a timepiece.

Coventry T.C. has adopted a recommendation of the Tramways Committee increasing the salary of the engineer and manager, Mr. T. R. WHITEHEAD, from £500 to £600 per annum.

Certain rearrangements of the staff of the mains department of the Manchester Electricity Supply Company have been made in consequence of the illness of Mr. L. R. LEE, mains engineer, and the Electricity Committee has decided to recommend the following increases of salaries:—Mr. J. CLARKE, from £230 to £275 per annum; Mr. H. HAWKINS, from £250 to £275 per annum; Mr. F. T. FOWLER from £200 to £210; and Mr. A. J. LOVELL from £185 to £200. The total advances amount to £75, which is the amount the mains engineer will relinquish from his salary of £475 per annum.

General.—Mr. C. J. SPENCER, manager of the Bradford City Tramways, has been appointed Vice-Chairman of the Lord Mayor's Citizens' Contribution Committee, which is charged with the important duty of systematising the collection of funds from all classes of citizens in Bradford for the replenishment of the Lord Mayor's War Relief Fund. Mr. H. MOSS, electrician, of Bradford, is on the same Committee as the representative of the local electrical engineers, together with Mr. THOS. ROLES, the Bradford city electrical engineer.

Mr. THOS. ROSS, the Bradford City electrical engineer, says that Mr. WILLIAM WOOD, the senior partner in the firm of Scapham & Wood, Ltd., timber merchants and makers of electric blocks, Leeds, has just completed 60 years of service at the works. The local Press has interviewed Mr. Wood in connection with the celebration, and in the course of the article it is mentioned that some years ago Mr. Wood and his sons prepared to meet the demand for electric switch blocks, bell pushes, and casings, laying down a special plant therefore, with the result that when war broke out they were in a position to secure a good deal of the German trade. Mr. Wood expresses the opinion that the Germans will never get it back.

London Gazette notice.—Territorial Force, Royal Engineers.
Tyne Electrical Engineers:—Second-Lieutenant H. G. WHITE
to be temporary captain; Second-Lieutenant (temporary Cap-
tain) H. G. WHITE is seconded.

With reference to a notice which appeared in this column in our issue of March 10th regarding the arrangement existing between Mr. C. H. Best and Mr. Charles Pullan, of Bradford, Mr. PULLAN writes to say that, so far as the date mentioned is concerned, the announcement is premature. "Certain differences have arisen between Mr. Best and myself, but no definite dissolution of the existing arrangement between us has been signed. I would add that it is my intention to continue with village electric supply schemes in the future."

We regret that in our report last week of the speech delivered by LORD VAXX OF HARROWDEN, at the Electrical Trades' Benevolent Institution annual meeting, reference was made to the death of Mr. E. G. Byng. This, of course, was an error, and should have read Mr. H. G. Byng.

Mr. W. B. SHIREHAMPTON, who was manager of the export department of Messrs. Verity, Ltd., for many years, is shortly proceeding to Russia in the interests of a few electrical firms, and would be glad to hear from others who are interested in the development of this important market now and after the war. He will be in the country for several weeks. Further particulars may be obtained from Mr. Shirehampton at 75, Curtain Road, E.C.

Roll of Honour.—The death has occurred, at the Royal Infirmary, Aberdeen, of Private WILLIAM WARNER, of the 1st Battalion Gordon Highlanders, who was wounded in November, 1914, during severe fighting in the Ypres region. Prior to the war he was engaged at the Keighley Corporation electricity works.

Private F. APPLETON, of the Buffs (East Kent Regiment), who has died of wounds received in action, was for seven years prior to the war engaged on the staff of the Isle of Thanet Tramway Co., Ltd.

Rifleman ALFRED DUDLEY TIDEY, of the Queen's Westminster Rifles, who has died after an operation at St. Mary's Cottage Hospital, Hampton, was, prior to his enlistment in August, 1914, engaged with the Pall Mall & St. James' Electric Light Co.

Rifleman F. Pot, of the Rifle Brigade, who was, prior to his enlistment, with the British Thomson-Houston Co., Ltd., of Rugby, is now reported killed in action. He had been missing since July 30th last, after a liquid fire attack at Hooge.

Private FRANK LYNAS, Royal Inniskilling Fusiliers, killed in action, was a Reserve man, and, prior to the war, was employed in the Belfast Corporation's electricity works.

Obituary.—MR. T. RICHARDS.—The death occurred last week of Mr. Thomas Richards, chairman of the Cleveland, Portlhead & District Electric Supply Co., Ltd.

[illegible]

Phonopore Construction Co., Ltd. (143,445).—This company was registered on March 29th, with a capital of £275 in 4,000 ordinary shares of £1 each and 3,500 founders' shares of 1s each, to carry on the business of manufacturers of military, telephonic and phonoporic instruments, munitions, and all other articles used in the manufacture thereof or used in communications, and all other articles used on land or sea, engineers, founders, &c., and to adopt the name of Phonopore Construction Co., Ltd. The subscribers (with one exception) are: H. J. Eck, 10, Priory Road, Chiswick, W. 9, engineer, 100 shares; J. Oswald, 5, Bulge Row, E.C.C., engineer, Private, 100 shares. Justus Eck shall be one of the first, and be less than five, and not more than nine, directors. The number of directors is not to be less than five, and not more than nine. Justus Eck shall be entitled during the continuance of a lease referred to in an agreement dated 1st January, 1916, between the company and Justus Eck, to be elected by the subscribers. Qualification of ordinary directors: £20 remuneration as fixed by the company (£200 per annum for the chairman). Justus Eck is chairman. Registered office: 53-57 Park Street, Southwark, S.E.

Walter Robb, Ltd. (143,493).—This company was registered on March 1, 1911, with a capital of £10,000 in £1 shares (9,000 "A" shares and 1,000 "B"), to take over the business of an electrical engineering firm, and is now managed by Walter Robb at Wakefield. The directors are: Walter Robb, 11, Drury Lane, Wakefield, electrical engineer; H. F. Buttenshaw, Walton near Wakefield, electrical engineer; and J. H. W. Lewis, 10, The Quadrant, Wakefield, electrical engineer. There are more than three names. The number of directors is not less than three. The company has a capital of £10,000, of which £416 and 10s. is paid up. The company is a permanent one. H. F. Buttenshaw has £416 and 10s. per annum respectively as remuneration for his services. The company is registered at Jordan & Sons, Ltd., 116-17, Park Street, Southampton.

Associated Engineers, Ltd. (143,474).—This company was associated on March 31st, with a capital of £1,000 in £1 shares, to carry on the business of electrical, motor, and general engineers, founders, machinery, and part manufacturers, at 15, Moorhead Lane, Bradford, automobile engineers; J. R. Rhodes, 15, Moorhead Lane, Bradford, automobile engineer. Private company. Authorized capital, £1,000 in 10 ordinary shares, seven; the number of directors is not to be less than three. The directors are: J. R. Rhodes, J. R. Peppin, and three others to be appointed by the first AGM. Qualifications: 10 ordinary shares. Solicitor: W. Dunn. Secretaries: E. Stringer. Registered office: Manor Row Chambers, 37, Manor Row, Bradford.

Banbury and District Electric Supply Co., Ltd.—A
Memorandum of satisfaction in full on February 5th, 1916, of debenture dated
March 26th, 1913, securing £100, has been filed.

Orford Electric Light and Power Co., Ltd.—Issue on December 10th, 1912, of £20, and on March 17th, 1916, of £130, debentures, parts of a series of which particulars have already been filed.

Ramsden Green, Ltd.—Issue on March 21st, 1916, of £235 debentures, part of a series of which particulars have already been filed.

Isle of Thanet Electric Tramways and Lighting Co., Ltd.
—Agreement, dated March 16th, 1916, to secure £1,000, and any sums which may become payable under a joint and several promissory note for £3,000, charged on the company's undertaking and property, present and future.
Holder: Lord Arthur Butler, 7, Portman Square, W.

Runbaken Magneto Co., Ltd.—Particulars of £1,000 debentures, created February 11th, 1916, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including unissued capital. No trustees.

Lancashire Motor and Engineering Co., Ltd.—Mortgage
dated March 8th, 1916, to secure £1,700, charged on the company's under-
taking and property, present and future, including uncalled capital. Holders:
J. Craig and G. H. Wood, Mosley Street, Manchester.

French Tramway Companies.

THE gross receipts of the *Tramways de Bordeaux* reached £242,000 in 1915, as compared with £254,000 in the previous twelve months, and the net profits were £51,000 and £57,000 in the two years respectively. It is intended to pay a dividend of 8s. per share, as against 9s. in 1914.

The gross receipts of the *Compagnie des Tramways de Nice et du Littoral* declined from £170,000 in 1914 to £126,000 last year, and the gross profits from £49,000 to £36,000. As the net profits only amount to £3,700, it is not proposed to make any distribution, and dividends were also not paid either in 1913 or 1914.

The *Société des Tramways d'Amiens* proposes to distribute £1 per share for 1915, as contrasted with 16s. in 1914, and £1 in 1913; the *Société Versaillaise de Tramways Electriques et de Distribution d'Energie*, £1 2s. per ordinary share for 1915, as in the previous year; the *Tramways-de Toulon*, 7s. 2½d. per share, or 9 per cent., for 1915; and the *Tramways du Var et du Gard*, 7s. 2½d. per share, as in 1914.

The *Compagnie Parisienne de Tramways* earned £316,000 in 1915, as compared with £347,000 in the previous year, but after deducting working expenses and financial charges the net profits only amount to £8,000, as against £25,000 in 1914. The financial charges include £16,000 for the settlement of litigious accounts and £23,000 for the improvement of the permanent way and rolling stock, whereas the amount provided under the latter heading was only £17,000 in 1914 and £12,000 in 1913. It is not proposed to pay any dividend for the past year, as was also the case in 1914, but to place most of the balance to a special fund, and to carry a small sum forward.

The *Société des Tramways de Rouen*, where great activity prevails in connection with the traffic with England, experienced a recovery in 1915 from the fluctuations in the receipts and profits which occurred in the preceding year. The directors state that it was possible to provide a new workshop staff in place of the men called up for service and to resume the maintenance and repair of the rolling stock, which had to be neglected in the later months of 1914. The gross receipts were the largest on record, and the net profits amounted to £45,000, as contrasted with £42,000 and £13,000 in the two previous years respectively. A dividend at the rate of £1 4s. per share has been declared, this comparing with £1 and £1 6s. 4d. in 1914 and 1913 respectively.

British Westinghouse Electric and Manufacturing Co., Ltd.

The net profit for 1915 was £176,752, plus £8,121 brought forward, making £184,873. There is written off patents, goodwill, &c., £25,000; special depreciation of plant, machinery, &c., £35,241; additional reserve for employers' liability, £5,000; dividend of 7½ per cent. on the preference shares, £75,000; carrying forward, £44,632. There have been charged against revenue the usual expenses for maintenance of works, plant, &c., and in addition there has been applied to depreciation of the same items £87,150, which includes the special sum stated above (£35,241) to cover abnormal wear and tear of plant due to war conditions. Having regard to possible liabilities for taxation of excess profits under the Finance and Munitions of War Acts, it has been thought desirable to carry forward a much larger sum than usual. Last year the directors referred to the acquisition of certain controlling interests in the French Westinghouse Co., and they are glad to say that the business of that company shows signs of improvement. Annual meeting: April 6th.

Brompton and Kensington Electricity Supply Co., Ltd.

At the annual meeting, on Monday, the Chairman (Mr. H. R. BEETON), said that his anticipation that the year 1915 would be even less satisfactory than 1914 had, unfortunately, been fulfilled. Although their output had more than doubled in the past 13 years, their profits for last year were the lowest for any year in that period, and it had only been after considerable discussion, and some difference of opinion, that the Board had recommended the payment of the usual dividend of 10 per cent. The justification for such a course was to be sought in the fact that they had husbanded their resources in more prosperous years, so that to-day they had more than half of their capital represented by mains, with reserves of profits amounting to upwards of 60 per cent. of their capital invested in the business, with no debenture debt, and with 15 years of their tenure still to run. But, although they had restricted themselves to 10 per cent. dividend when it would sometimes have been possible to pay more, they could not, of course, maintain this rate if the scale of profits were to remain permanently at its present level. The present condition of things was mainly due to public restriction and private economy in lighting, and to increased cost of production consequent upon the war. Although a profitable return on the capital invested in the Accessories Co. with a view to encouraging the use of electricity for heating and cooking had been further postponed owing to the war, it was largely due to such expenditure that in their purely residential area they had virtually maintained their output in spite of restriction in lighting. The new turbo-generator, when installed, would give considerable economy in working to compensate them in some measure for increased cost of coal. Although the emergency legislation for limitation of price had tended to amelioration, they had not so far realised the full benefit promised under the Act, chiefly owing to disorganisation in production and shortage in transportation. The matter was, however, receiving the attention of a Committee of the Gas and Electricity Companies in conjunction with the Departments of Admiralty and Munitions, and it was hoped that some amendment would ensue. Although the progress of the Accessories Co. had been retarded by the war, its capital account had not been extended, and its revenue results showed an improvement, which was likely to grow. The Restaurant, which continued to serve as an excel-

lent advertisement as well as an experimental laboratory, now enjoyed a custom which, in spite of the increased price of food, made it self-supporting. The show-room sales had been prejudiced by the prevailing shallowness of the public purse, and the stove department, whilst furnishing some important cooking installations, had been largely diverted to the production of munitions. The experience of the first three months of this year led him to conclude that the results of the present year would not be substantially worse than those of the past year, and if the coal position, which was undoubtedly precarious, was not aggravated, they might be rather better.

W. T. Glover and Co., Ltd.

Trading during 1915 resulted in a credit balance of £54,438, and £7,950 was brought forward. The following are deducted:—Directors' remuneration, &c., £1,035; 4½ per cent. interest on first mortgage debenture stock, £4,250; 5 per cent. interest on second mortgage debenture stock, £2,642; written off investments, £5,949; appropriation for payment to trustees of second mortgage debenture stock, £4,000; 5 per cent. preference dividend, £4,333; transfer to first mortgage debenture redemption fund, £2,500; dividend of 5 per cent., less income-tax, on ordinary shares, £4,977; transfer to reserve fund, £20,000; leaving £11,701 to be carried forward subject to payment of excess profit duty. With the above appropriations the redemption fund for the first mortgage debenture stock will stand at £40,500, that for the second ditto at £36,000, and the reserve fund at £50,000, making a total of £126,500. It will be appreciated that to provide the increased working capital to meet the present conditions, it is necessary to materially strengthen the company's reserves. During the year the works have been, and still are, largely engaged on the manufacture of cables, wires, &c., directly or indirectly for the prosecution of the war. Nine acres of land have been purchased for the general development of the company's business, which of late years has suffered by the works being greatly congested. A portion of this land is thought to be in excess of the company's probable requirements, and it is proposed to sell such portion to the Trafford Power & Light Supply (1902), Ltd., in whose welfare the company is largely interested. The directors ask for full power to transact business from time to time with that company, notwithstanding that they, or some of them, may be directors of that company. Annual meeting: April 10th.

The Berlin Elevated and Underground Railway.

The report for 1915 of the *Gesellschaft für Elektrische Hoch und Untergrund Bahnen* states that a large decline in the passenger traffic occurred in the seven months ended with July, as compared with the equivalent period in the previous peace year, but a not inconsiderable increase took place in August and September, which had also continued into 1916. During the year the total number of passengers carried amounted to 69,542,277, as against 77,027,513 in 1914, and the expansion in the last five months was 4,352,000 in excess of the corresponding term in 1914. The working results were influenced by the large advances in wages and the cost of materials, and further reductions in the customary employes' were caused through men being called to the Army, which, however, it was possible substantially to equalise by the engagement of women. The train mileage run was 2,123,476, as contrasted with 2,698,404 miles in 1914; the daily average number of persons carried was 190,527, and the average receipts per passenger amounted to 1.52d., as against 1.54d. in the preceding year. The accounts show the following figures:—

	1914.	1915.
Ordinary share capital	£2,600,000	£2,600,000
Preference shares	500,000	500,000
Loans	3,994,000	3,988,000
Gross receipts	418,000	394,000
Net profits	190,000	168,000
Dividend percentage on ord. shares ...	4½	4
Carried forward	31,000	17,000

The report states that work on the line from the "triangle" to the Nollendorf Platz and Wittenberg Platz was continued as far as the circumstances permitted.

Woking Electric Supply Co., Ltd.

The total revenue for 1915 was £20,331, and the working expenses were £10,649, leaving £9,681, plus £653 brought forward and £124 income-tax accumulations. The interest on debenture stock absorbs £2,514, interest on temporary loans £289, 6 per cent. preference dividend £2,999, and there is put to depreciation and renewals fund £1,750, £900 to reserve, 5 per cent. is paid on the ordinary shares, and £693 is being carried forward. The number of consumers increased from 2,021 to 2,101, and the lamps connected from 95,803 to 106,360, the net revenue advancing from £18,878 to £20,331. During 1915 there were issued £580 4½ per cent. debenture stock and £245 ordinary shares. Owing to the continuous growth of the business, issues of further debenture stock and ordinary shares were necessary. The annual meeting was held on March 25th.

Urban Electric Supply Co., Ltd.—The gross profit for 1915 was £68,513, as against £68,962 for 1914. The available balance is £21,889, out of which £12,500 is required for preference dividend and £9,389 is carried to reserve for depreciation.

Telegraph
Works
Co., Ltd.**

Mr. S. GEDGE presided at the annual meeting on March 29th. He said that out of £10,000 set aside last year to provide for the dependents of the company's employees with the Forces, £1,330 had been spent, and he hoped that the balance would suffice for the purpose intended. The company had made a larger profit than in the previous year. They had not been able to accept all the private orders which they had been offered, but he hoped that they would not eventually lose those customers. They recommended a dividend and bonus of 25 per cent. for the year, or 5 per cent. more than was paid in the previous year. The company was excellently managed. The profit was about £11,000 more than that of the previous year. Ample provision had been made also for any claim which might be made in connection with the excess profits tax. They had over £130,000 in War Loans and other trustee securities at cost, less a reserve of £10,000. He had visited the works recently, both at Woodwich and Gravesend, and had seen the great improvements which had taken place during the year. At Woodwich they had suffered considerably from lack of space, and Mr. Hutton deserved great praise for the way in which he had overcome difficulties and had been able to meet requirements. At Gravesend they were in a different position, inasmuch as they had 12 acres to deal with, and could put up exactly what was required. Their workshops there were finer than any in the country, and they had now completed very fine dining-rooms for the workpeople with separate accommodation for both men and women, and these were lighted and heated by electricity, whilst they also cooked by electricity. Then, again, near by, in Union Street, they had opened a large warehouse for the purpose of their tin business. The Blomfield Street premises had been extended by taking in adjoining buildings, as the staff there now consisted of some 240 people. The MANAGING DIRECTOR, Mr. GEORGE SUTTON, M.L.E.E., who seconded the adoption of the report, said that the extraordinary course of events of the war had been reflected in their business. In addition to their special activities, other features of the year were the reduction in the demand, and their inability to meet the demand that did exist, for cables for the home and colonial commercial trade, and the greatly increased demand from neutral countries. As regards the home trade and the reduction in the demand for cables for commercial purposes, there had been a great falling off in the usual home and colonial demand for wire and cables apart from cables required in connection with the war. Shareholders might think that they were also losing goodwill. He did not, however, think that they would do so. They would not suffer the loss of their orders because of inability to execute them through working in the national interests. In regard to the increased demand from neutral countries, to some extent that was due to the closing down of the German supply. In Germany and abroad, but not much in England, they had a great competitor. He thought that on the whole outside the British Colonies they had a larger trade in cables than English manufacturers, and therefore the closing down of the German trade had increased the demand on English manufacturers. The demand, however, had been very difficult to meet in consequence of the uncertainty of obtaining licences for export from the Government, and although they were able to locate their consignees, so that they knew that their cables would not find their way into an enemy country, there were no doubt other reasons which necessitated the stoppage of exports to neutral countries. They endeavoured not to commence the manufacture of cables until they had reasonable grounds to suppose that they would be able to dispatch them. The increase in the profit was due particularly to two causes. First, there was the strong financial position of the company. When the war started their position and credit were at a very high standard, and they used them, and continued to use them, to buy as freely as desirable those materials which were essential to meet the demand for their products which they expected would be upon them. Copper, rubber, and lead were the principal essentials, and their large forward purchases of these materials, which had risen so much in value, had brought considerable profits, as they had been made into cables, which were sold on the price of raw materials at the time the cables were ordered. There was, of course, another side to the picture. When raw materials fell in value, they were bound to be carrying a stock, more or less large, which involved them in a loss when sold in the form of cable. That was a contingency they always had with them, although it was now greater than usual, but the nature of their business necessitated always purchasing certain materials some months ahead of requirements, and their accounts always made provision, by means of contingent reserves, for the eventuality of loss on stocks. The second cause of the increased profit was increased turnover. They had added considerably to their plant in order to enable them to meet the demands which were made upon them, and owing to the uncertainty of their getting deliveries of small sizes of copper wire which they did not make, and which was required for most cables, they required for a cash payment a small factory in Yorkshire. The motor tire factory was more than paying its way. He could see the possibilities of an industry being built up there that might become as large as the electrical side. In regard to trade after the war, they did not know what the demand for their products would be, but they knew that the capacity for making insulated wires and cables in this country had enormously increased owing to the war demand. As they had

put down new plant, they might be assured that other cable makers had done likewise, and there would be a severe struggle for the business to be had, which would probably mean the cutting of prices. They hoped that that might be avoided for the good of the industry generally, but with more machinery in the country than could be employed, it looked as though they might have a difficult time in front of them. They were not afraid, however, that Henley's would be unable to meet the position, for they possessed three first essentials of success—money, skill, and good organisation; and as they had successfully weathered storms in the past, they might look forward to the future with equanimity.

**Madras
Electric
Tramways
(1904), Ltd.**

Mr. A. M. QUIL, presiding at the annual meeting last week, said that for the first seven months of 1915 the traffic receipts were 6 per cent. less than for the corresponding period of 1914. During the last five months there was such a marked improvement in traffic that for the whole year there was an increase of 6.1 per cent. in traffic receipts and an increase in net receipts, and an advance of 5 per cent. in passengers carried. The special renewals of permanent way, which had been in hand for some years, had been practically completed. It was very satisfactory to be able to recommend an increase in the ordinary dividend. Recently a resolution was passed by the Madras Corporation praying the Government to increase the track rent paid by the company. If this petition were granted it would be a breach of faith. The fares were as low as in any part of the world, and much lower than they were entitled to charge under their Government Orders. The dividend on the shares could not be regarded as extravagant (5 per cent.), particularly as the average return since the company was incorporated was only 3.3 per cent. With regard to the negotiations with the Government regarding various extensions, referred to a year ago, the routes were approved by the Corporation and submitted to the Government for confirmation, but they still awaited the latter's decision.

**City of London
Electric
Lighting
Co., Ltd.**

Mr. F. W. REYNOLDS, presiding at the annual meeting on March 22nd, said that Mr. Braithwaite, the chairman, was in America on very urgent business. The Marquess of Winchester was on active service. The capital expended during 1915 was about half the usual amount, and in 1916 it would be still less, as they were reducing expenditure in all directions. There was no object in giving a detailed comparison of revenue and working expenses, as in such abnormal times it could be of no real value. Everything that could be done to produce economical working was being done, and they hoped that there would be some limit to the rise in prices, which was so seriously affecting their business. Their chief difficulty was in regard to coal, the price of which was now 160 per cent. more than before the war, chiefly by reason of increased shipping rates, and supplies had at times been exceedingly difficult to obtain. For 1915, coal cost £14,000 more than for 1914, an increase of 40 per cent. There was no prospect of early relief, indeed, they must expect another and still larger increase during 1916. They were no believers in the policy of raising prices in such times as these until they had actually felt the effect of the increased cost of production and could claim that the time had come to ask consumers to take a further share of the burden. Both last year and this year shareholders had submitted voluntarily to a reduction of their income, before increasing the price of electricity. They had just given public notice of their intention to increase the price of electricity by 10 per cent. after the end of March. The balance for the year was about £16,000 less than last year. They were distributing £11,000 less in dividends, and providing the balance of £5,000 by reducing the carry-forward to £18,000. It had been pointed out at previous meetings that their liberal carry-forward constituted a dividend equalisation fund, and the present was a time when they might rightly draw upon that fund. The company had 168 members of its staff with the Forces, 1 had been killed and 9 wounded. None of their staff were pecuniary losers by going to the front; all cases were carefully attended to by the managing directors, Mr. Bailey and Mr. Bull.

**British
Aluminium
Co., Ltd.**

Mr. A. W. TAYLOR presided at the annual meeting last Friday. He said that the trading profits for the year, after making the provision for excess profits duty and adding interest and dividends on investments and deposits and the revenue derived from estates and transfer fees, was £322,546, an increase of £10,291. These results were the best which the company had shown since its incorporation in 1894. The conditions were, however, absolutely abnormal, and entirely due to the exceptional demand. He could not give particulars of the uses to which the metal was at present being put, and it was useless to speculate as to the probable conditions which would rule as regards the demand for the metal after the war. The recent uses and developments would go a long way to make up for any falling off there might be in the ordinary demand, due to the unavoidable and necessary period of recuperation required by all countries involved in the war. Further, there was no doubt that the experience gained during this war would open up a demand in certain directions in the future, which would considerably broaden the uses and applications of the metal.

The sales had been approximately the same as those of the previous year, and this was accounted for not by any slackening in the demand, but owing to a shortage in the anticipated production, due to abnormal weather conditions in the West of Scotland and in Norway during the summer of last year. Prices for the metal showed substantial advances during the year; but these advances occurred particularly during the last six months, and as it had always been the practice to cover the requirements of their regular customers at fixed prices for the whole year, the average which was obtained was considerably below current prices at the end of the year. The cost of production had been very materially affected during the year, owing to the heavy increases in labour charges and the cost of raw materials, freights, insurances, and other expenses. Great difficulties had been experienced in obtaining the necessary supplies of raw materials and coal required by the various works, the principal difficulty being not so much the supply of the actual material as the obtaining of the necessary freighting facilities. The difficulties with regard to the supply of raw materials and labour and freight would undoubtedly exist until the termination of the war, and in consequence, the costs of production were showing, and would continue to show, very material increases. The various works of the company had been fully employed during the year, and the additional plant for the manufacture of carbon electrodes was completed and put into operation before the close of the year. The erection of the new alumina works, which should have been completed by this time, had made slow progress, entirely due to the shortage of labour and materials, and it would be some months yet before those works could be put into operation. No further development work had been carried out on the Osiers power scheme, nor was this possible until after the war. The Martigny-Osiers Railway continued in operation for general traffic, but it did not contribute anything to their revenue. The depreciation reserve account had been increased to £250,000 by the appropriation of £50,000 from the profits of the year, and the reserve account had also been brought up to the same sum by the appropriation of £70,000 from the profits of the year. The necessity for making ample provision for reserves had been accentuated by the abnormal conditions, and it was advisable that their position should be strengthened, in order that they might be able to meet the peculiar and difficult times which would arise at the termination of the war, when ordinary commercial business had to be resumed in the markets of the world. Their competitors in neutral countries had naturally been considerably strengthening their position during these abnormal times, and, as their resources had not been depleted by the heavy taxation which was falling upon British industry, they would be in a position, if necessary or desirable, to create keen competition in international markets and also in the home market, unless some measure of protection was given by the Government. The results submitted were undoubtedly satisfactory, and amply justified the policy of the gradual building up of reserves which had been one of the main principles adopted by the present board of directors since the reorganisation of the company six years ago, and, looking back over those six years, the progress which the company had made in the time, and the position which it had established for itself, both commercially and financially, were good. However, this company, like all industrial enterprises, must be subject to the usual fluctuations which were the law of industry, and it was therefore incumbent upon the directors to see that the position of the company was strengthened, so that it could not only meet the demands of the extension of its activities, but that it might be able to live through any period of temporary depression with comparative equanimity.

Cleveland and Durham Electric Power, Ltd.

Mr. J. FALCONER, M.P., presided at the annual meeting on Friday last. He said that the gross profits showed a decrease of £5,681, but that figure, owing to the exceptional way in which the company had been adversely affected by the war, did not afford any indication of the development of the business. If they took the business of the three combined companies, which was the only sound method of ascertaining what the true result of the business had been, for the years 1913-14-15, they found that the gross revenue had been as follows:—£131,993 in 1913, £141,482 in 1914, and £151,512 in 1915, increases of £10,000 in each of the two years since 1913; the profit was year. In their case, differing from the experience of other of their companies, the result had been a serious diminution in the value of business done without any corresponding diminution of the amount of plant required to meet the demand. In all the mining districts—coal and iron alike—the output had been greatly reduced owing to the absence of men at the war. This had been further accentuated by the fact that in other businesses, such as the cement business, which they supplied, there had been substantial reductions in the demand for material produced. There had been practically no increase in the demand for current for the manufacture of munitions. The company's revenue had increased by £20,000 in the three years 1913-14-15; that was the natural development of the business. On the other hand, they had been seriously hit by the war in the matter of the cost of production. The figures for the past three years were:—1913, £91,839; 1914, £95,914; and 1915, £110,968. That increased cost was due to two causes. In the first place, the amount of current which they had generated in their waste

heat stations had been seriously reduced by the fact that hematite iron had been largely substituted for Cleveland iron, and the result had been that the gases available for the waste heat stations had been much reduced. In 1915 the volume of energy delivered to them from waste heat stations had been reduced by about 15 million units as compared with the previous year. The consequence was that the energy they had supplied had come from the coal-fired plant at Gannetown. Thus, the coal bill was greatly enlarged, while prices had been very much in excess of those obtaining in normal times. In 1913 their coal bill was £845 whereas in 1915 it was £30,404, an increase of something over £15,000. This increase had had a serious effect upon their cost, and would continue to have an effect during the war. They must take this element into account in judging the trade condition of their business. The war had revealed to them the extraordinary value of the waste heat arrangement they had made. If the current had not been supplied to them through the waste heat stations it would have been impossible for the company to have lived through the period it had passed through, because it could not have paid for the coal (in the absence of waste heat stations) required for the consumers. They had never had to increase their high load, which would have given them additional revenue, nor had they been in a position to ask for increased prices. Their policy had been, in order to ensure financial stability, to have long-term agreements with their consumers, a policy which, he believed, was thoroughly sound on a company that had not a large reserve of capital behind it. In consequence of this, they had been compelled during the war to supply their consumers at the same prices as in normal times, notwithstanding that their costs had increased. It was, therefore, impossible for them to compare their conditions with those of other companies. They had for some time been satisfied that it was imperative, in order to obtain a fair return for their current, that they should stand out for a higher price, and they had also decided that their future policy should be to insist upon having a graduated scale of prices varying according to the price of coal. After the report had been seconded, Mr. A. GAMMELL said that the halting and lame apology which the chairman had made was not satisfactory. It was not much consolation to hear that waste heat had failed them when they required it most, and when coal was dear. He suggested that there should be a Government inquiry into the position of the company. The report was adopted.

Liverpool District Lighting Co., Ltd.

At the annual meeting, held last week, the Chairman referred to the death of one director and the resignation of another, and added that Mr. Bromley Holmes, formerly city electrical engineer of Liverpool, had been appointed to the board. The accounts showed that they had done better than they expected. Restriction of lighting had caused a loss of 40,000 units and £850 revenue, but they had obtained Government contracts resulting in the sale of 108,000 units, so that the net increase was 68,000, the largest they had experienced, though, of course, they could not obtain the same price for large Government contracts as from other consumers. The result was a net increase of income of £168, but the increased cost of fuel, &c., was £500, leaving a net reduction of £332 in working profit. Fuel had further risen, and would affect the 1916 figures. To counteract this, they had allowed the head of the Liverpool Corporation and had increased their charges by 12½ per cent. all round. They were considering the question of coal storage, so as to provide for further reserves of fuel. The dividend for the year was 1 per cent.

Bell Telephone Co. of Canada.—The accounts for 1915 show gross earnings of \$9,631,673, as compared with \$9,599,026, and after deducting all charges, including \$2,170,000 (against \$2,010,000) for depreciation, the net revenue totalled \$1,663,845, which compares with \$1,659,857. The usual dividend of 8 per cent. has been paid, leaving a surplus of \$223,848, increasing the total surplus to \$1,249,139. (*Financial News*).

Falkirk and District Tramways Co., Ltd.—The *Financial News* states that the accounts to October 16th show an available sum, including 1917 depreciation at £5,847. After providing for depreciation, &c., the directors declare a dividend of 6 per cent. for the year, as compared with 5 per cent. for each of the two preceding years, carrying forward £726.

Calcutta Electric Supply Corporation, Ltd.—The units sold to consumers during the four weeks ended February 25th were 1,362,833, compared with 990,763 in the corresponding four weeks of 1915.

STOCKS AND SHARES.

TUESDAY EVENING.

The Budget is out this Tuesday night, and the secrets which the Chancellor of the Exchequer has kept with commendable closeness now stand revealed to the expectant taxpayer. These mysteries exercised a slightly numbing effect upon investment business before they were made known, but

had little influence upon prices, this being traceable more in the sentiment which prevailed than in quotations themselves. The Home Railway market has given way in the absence of further support coming forward to assist the buying movement of a fortnight ago. Once the Budget proposals are digested, investment business will return to the House, because there is literally any amount of money about; and the provinces, prospering like the proverbial bay tree, although for a different reason, send the bulk of their capital to London when they wish to employ it in Stock Exchange channels.

Amongst the electric lighting shares which went ex dividend last Friday are both classes of City of London and County of London shares. Metropolitan are again $\frac{1}{2}$ up on the week, thanks, of course, to the expectation of what the new committee may be able to do by way of suggestion with a view to restoring the company to some, at least, of its past success. It is worth noticing that City and County preference have both returned to their par value of £10, at which the yield is 6 per cent. on the money. St. James' are $\frac{1}{2}$ better, and the market as a whole shows firmness, due to a little inquiry for several of the best-class shares, and the discovery of the buyers that there are very few shareholders who wish to realise at the present time and prices.

Underground Electric income bonds have again risen $\frac{1}{2}$ to 83, being picked up by investors in the provinces who realise the attractions of a security upon which the interest is paid free of taxation when that tax is something to be seriously taken into account.

In which connection, may we observe that, with the income-tax fluctuating as it is at the present time—for even the latest proposals may not prove the limit of the burden which the war will impose in this way—it seems advisable to abandon our previous practice of estimating the yield with allowance for the tax, in those cases where dividends are paid free. Accordingly, we have reverted to the previous practice of working out all the returns on a "flat" scale, but have indicated by an asterisk those stocks and shares the dividends upon which are distributed free of tax. It requires but a simple calculation for the person interested to make this allowance according to the amount of income-tax current when he is working out the return.

Districts have gone back to 163, shedding most of their previous week's rise, but Metropolitan and Central Londons are steady. Tube railways stand to benefit from Zeppelin scares; and the ill-wind which brings the raiders may possibly profit proprietors of tube stocks.

The feature in telegraph markets is the further rise in the price of Marconis. A month ago the shares stood below 2, and to-day they are at 7s. 6d. higher, the reason for the improvement being the expectations of the amount which the Government is thought likely to pay the company for the use of its system since war broke out. Another bull point is the announcement that Senator Marconi has invented a new development in wireless telegraphy, which bids fair to be of great importance, and which will be made public as soon as the formalities in connection with patent rights are concluded. American Marconis have hardened to 16s., and Canadians to 8s., the cheerful optimist maintaining that the latter will certainly go to 10s. before long.

Both the Globe Telegraph shares are ex dividend, but have recovered the deduction in each case. Eastern ordinary rose a point. The Anglo-American Telegraph stocks are a little lower.

The report of the British Westinghouse Co. did not entirely dissipate the disappointment felt with the retention of the dividend at 7½ per cent., and the price of the shares is dullish at 2. Electric Constructions at 15s. are a shade better. Telegraph Constructions rose 10s. to 34½. Manufacturing issues are good as a whole, such shares as Henleys, Callenders, British Insulated, and India-Rubber being more readily sold than bought, except when they come to market in connection with a deceased account.

The activity in rubber shares has died down in consequence of the interruption to communication with the provinces caused by the gale of last week. The lines are being mended, but even as late as this (Tuesday) evening, telegraphic and telephonic communications with the country outside London are erratic and uncertain. There is not much doing in copper shares. Prices of the popular companies move rather aimlessly, and business is of a meagre character.

Various of the American light and power shares have risen sharply during the past few days. Alabama Traction, Light and Power common gained 3 points at 24, and the bonds put on 2 at 67. Mississippi River Power shares advanced 4 to 20, and this group is in demand from people on the other side of the Atlantic. They, on their part, cannot sell shares here, in consequence of the physical possession restrictions imposed by the Treasury, so, as their transactions must all be purchases so far as London is concerned, the market moves only one way when there is anything doing in it on account of New York. Brazil Traction, too, are better at 54½; and there has been a sensational rise in the shares of the City Services Co. Mexican issues are harder in tone; the only quotable alteration is a rise of 8 points—making 6 within the past fortnight—in the Tramway Co.'s 5 per cent. bonds.

Browett, Lindley and Co., Ltd.—According to the *Financial Times* the report for 1915 shows, after deducting £1,907 for interest, writing off £6,316 for depreciation, and making provision for tax and duty, a net profit of £14,010, to be deducted from the debit, which will then stand at £7,696. The directors submit a scheme for readjustment of capital.

Oldham, Ashton and Hyde Electric Tramway Co., Ltd.—The report for 1915 states (says the *Financial Times*) that the revenue amounts to £34,823 (£33,393 in 1914), and the expenditure (including £1,600 for debenture interest and £1,500 placed to provision for renewals account) amounts to £25,062 (compared with £26,024 in 1914), leaving a net profit of £9,761 (compared with £7,374), which, plus £1,021 brought forward, makes £10,782. The directors propose to place to reserve fund £3,000, to pay a dividend at the rate of 6 per cent. per annum on the ordinary shares, and to carry forward £2,282.

Marconi Wireless Telegraph Co. of America.—The gross earnings for 1915 were £141,000, against £150,600 in 1914; other income £21,000, against £30,000. £22,400 is placed to reserve, as compared with £24,400, carrying £35,400 forward, as against £29,800.

Shawinigan Water and Power Co.—A dividend at the rate of 1½ per cent. for the quarter ended March 31st upon the common stock is announced.

METAL MARKET.

Fluctuations in March.

THE HIRE AND MAINTENANCE OF
CONTINUOUS-CURRENT MOTORS.

By HENRY JOSEPH, A.M.I.E.E.

(Abstract of paper read before THE INSTITUTION OF ELECTRICAL ENGINEERS at Leeds, March 8th, 1916.)

THE electricity-supply undertaking of which the author has charge supplies continuous current, principally for textile driving, in the town of Hawick, in Roxburghshire. Table I shows the proportion of motors on hire at the end of 1914 in mills and for various industrial purposes.

TABLE I.

	No. of motors.	Total H.P.	Average H.P.
Consumers' own motors ...	162	966	6.0
Motors on hire-purchase ...	9	445	49.5
Motors on hire ...	105	643	6.1
Totals ...	276	2,054	7.5

Practically the whole of the above motors are maintained by the author's staff; and most of those owned by the consumers have been supplied through the company and the drive arranged under their supervision. Table II gives the present rates of hire for some of the sizes.

TABLE II.

H.P.	Quarterly rental.	H.P.	Quarterly rental.
	£ s. d.		£ s. d.
1/2	0 9 0	10	3 5 0
1	1 0 0	20	4 5 0
5	2 5 0	50	6 5 0

The hire rate includes the motor complete with pulley, starter, main switch, cut-outs, shunt regulator, and slide rails, if these are required, all fixed and connected up. The hirer pays for belting and the cost of mains from the service (or from the nearest available point of supply) to the motor and starter. The result is that practically the whole of the material is returnable on dismantling, and only the cost of labour is lost.

The rental covers the cost of all maintenance and renewals. New brushes are fitted when required, and no question as to whether the company is liable ever arises in the event of a breakdown. Damage occasionally occurs as the result of carelessness or negligence on the part of the hirer's employés, but it has not been considered good policy to raise the question of liability in such cases. They do not often occur, and the inconvenience caused to the user by a breakdown is quite sufficient incentive as a rule for him to urge his employés to treat the motor carefully.

It is to this policy, coupled with prompt attention to repairs, that the success of the hire system is largely due. Consequently consumers are quite willing to pay in most cases rentals which are admittedly high in comparison with the purchase price of the motors.

The company safeguards itself against loss due to a motor being hired for a short period and then returned, by inserting a clause in the hire agreement by which the hirer undertakes to pay an agreed sum to cover the cost of installation and removal in the event of a motor being returned before the expiration of a stated period.

Nearly all the hosiery mills, among them some of the largest in Scotland, hire their motors. They prefer to confine their attention to their business and to hand over the whole responsibility of their electric drive to the supply company.

Consumers possessing their own motors are encouraged to insure them against breakdown. In the event of a minor breakdown, a man is promptly on the spot to carry out repairs on site if possible. If the trouble cannot be quickly remedied another motor is fixed as quickly as possible. For mill work these are important considerations.

Since 1902 the average horse-power has increased from 3.2 to 6.1 H.P., and the capital cost has diminished from £11 to £6 per H.P. There has been a gradual increase in the percentage cost of maintenance due to the ageing of the bulk of the motors: this figure will probably settle down to an average of about 6 per cent. on the capital cost.

During the last five years the gross rentals amounted to about 18 per cent. of the capital outlay (about 25 per cent. is the average rental obtained on the total cost with new motors during this period), and the net rental was about 12 per cent., part of which is allocated to revenue and the balance set aside to a redemption fund for writing down the value of the motors when returned from hire.

About 27 motors are kept in stock, 40 starters, 12 shunt regulators, and 60 pulleys, besides a stock of every size and type of brush in use in the town, both on consumers' own and hired motors. There are over 40 of these, and they are each given a number, which is also painted in large figures on the motor frame. A card system is used to record the history of each motor.

Electrolytic Gas for Lighting and Heating.—In a recent issue of *Elettrotecnica*, Carlo Velardi advocates the use of hydrogen gas, obtained by electrolysis, for lighting and heating, in substitution for, or mixed with, coal gas. The difficulties attending its use, the chief of which is its distribution, are easily surmounted, while the advantages from its employment, especially in a country like Italy, abounding in hydro-electric energy, are great. Its utilisation for heating and cooking purposes, he contends, is easier of realisation than the replacement of coal gas by electricity.

The company act as wiring contractors, and always have a staff of wiremen available. The permanent wiremen and mains staff are all trained for motor work, and one man in particular spends most of his time on motor repairs, and is as often as not in the works and readily available for emergency calls.

If a report of a breakdown is received, a man is sent out at once and reports by telephone if the failure is such that it cannot be repaired quickly on site. In that case he sets to work to get the faulty motor disconnected and removed from its bed. Particulars of the drive at the same time are ascertained at the works, and a suitable motor is selected from stock. A motor or horse lorry is ordered, preferably the former, and the motor is slung up and very little time lost in getting it on site.

Battens are taken to the job with it, and as the old bolt centres are probably wrong it may be necessary to screw the battens down with the old foundation bolts (if these are set in concrete), and coach-screw the motor down to them. Usually, however, motors are already fixed on battens wide enough to allow of considerable variation in bolt centres, so that little time is lost in fixing down another motor to them.

As a motor is often fixed in a room which can only be reached by taking it up two or three flights of stairs, a good deal of experience and some ingenuity is needed in handling it quickly and safely. Sometimes in the case of small motors, up to say 5 H.P., it is quickest to remove both end shields and take out the armature, when the motor can be carried up in pieces.

Pulleys are sometimes made to fit the shaft too tightly and are driven on hard; they are best shifted with a pair of screw pulley drawers. Keys are now always fitted with gib heads.

In many cases a small motor, up to say 5 H.P., can be changed in an hour and a half from the time of the breakdown, but possibly a more usual period from the notification of stoppage to the time a new motor is running is double this.

Large motors cannot be handled nearly so quickly, but by having men working simultaneously on the old and new motors while at the same time the pulley is being prepared, it is by no means impossible to change a 30-50 H.P. motor in 2½ to 3 hours.

The majority of stoppages are due to starter troubles, and of these the bulk are caused by burnt-out resistances or open-circuited hold-over coils, these fairly frequently failing at the leading-in wires. Most starter defects can be remedied, at any rate temporarily, on site. If not, a fresh starter is telephoned for. In the case of a large motor it is usually quicker to repair a fault on a field coil on site than to change the motor. It means removing one end, taking out the armature, and perhaps removing a pole-piece to get the coil out. By cutting away the outer tape before dismantling one can usually judge as to whether the trouble is sufficiently near the surface for a fairly quick repair to be possible. If the breakdown occurs in the afternoon a large motor is never changed for a field-coil repair unless it is a genuine burn-out.

In the case of armature faults it is often possible to make a temporary repair on site which will keep the motor running until a week-end. The commonest fault, especially in small armatures wound with fine-gauge conductors, is a break at the point where one of the ends bends away from the coil. One can frequently get over this in lap-wound armatures by soldering across the commutator lugs.

The surest way to keep down the cost of repairs is to educate one of the hire's employes to keep the motor clean and the armature and field coils blown free from dust, to see that brushes do not wear down too far, and to keep a proper level of clean oil in the bearings. As a breakdown entails interruption of the user's business, he will usually see that one man is made responsible for a particular motor and that he gives it ten minutes or so of attention, say, once a week.

It was at one time thought that periodic inspection would lead to a diminution of breakdowns, but this, after being tried, was abandoned. It has been found more advantageous to risk a motor running till it fails than to inspect 20 or 30 motors on the chance of detecting one which needs attention.

When a hired motor needs general overhaul it is taken entirely to pieces, the commutator turned, the mica recessed, and the armature and field coils varnished with a suitable insulating varnish. Bands are inspected, and if at all slack are replaced, and fresh whip-cord if necessary is wound on. Bearings are inspected and re-white-metalled if necessary, or, in the case of bushes, new ones fitted if required, or the old ones lined with white-metal. The brush-gear is taken to pieces and overhauled, and the frame thoroughly cleaned with petrol and finally painted. The colour is a grey, but the actual shade is changed each year, thus giving a rough guide as to how long a motor has run since the last overhaul. Finally, the machine is run for eight hours at full load driving another motor as a dynamo, and if satisfactory it is ready to be sent out again. It is believed that a motor sent out smartly painted and looking like new is likely to receive more careful attention than if issued in a shabby condition. There seems to be no doubt that the user takes a pride in keeping it in good condition.

When a rewind is necessary the repair is usually done at the works, the necessary coils being bought from the makers.

The question frequently arises whether in a particular case it pays to rewind rather than replace one or two faulty coils. It is very annoying after fitting a couple of coils to find that another has been damaged in lifting. It is still more pro-

voking if the second failure does not occur until the armature has been belted and the motor re-assembled and tested. If the original faulty coils have been overheated to such an extent as to be useless as a guide to the condition of the rest, it is probably a good plan to scrap an additional coil and bend the wire to see if the cotton is perished and breaks easily. If so, it should certainly be rewound, because the coils which have to be lifted are almost certain to be damaged during the process.

Armatures should, of course, have a preliminary fall-of-potential test before the ends are sweated into the commutator. In connection with voltage-drop tests generally, the author would draw attention to what he believes is a fairly common error, namely, putting the current leads on opposite ends of a diameter or separated by an angle corresponding to the brush positions. If this is done and there are equalising connections, confusion is apt to arise, especially if, as is sometimes the case, one or more equalising wires are broken. If the current leads as well as the millivoltmeter leads are both applied to adjacent bars, the effect of possible trouble with equalising connections is eliminated.

One cannot by too much stress on the importance of recessing the mica below the surface of the copper on the commutator. The saving in brushes is most marked, and in a few instances in particular it is little short of astonishing. Motors which have been known to consume a set of brushes in three weeks will go for twelve months without a single new one.

In 1914 the cost of carbon brushes per H.P. was 7d., and per motor 3s. 7d.

An effort has been made in recent years to adopt a standard motor, past experience having shown up a number of defects in various makes.

The principal points looked for are a liberal rating without undue weight and bulkiness, ease of dismantling, large bearings, and an accessible commutator. Suitable brush-gear is also a consideration. No brush-holder except of a positive radial type should be fitted to a motor. Old motors with obsolete brush-gear have been wonderfully improved by changing the holders.

Ball bearings should be avoided, for they are most unsatisfactory. Narrow pole gaps are also a great source of trouble. The small saving in efficiency is certainly outweighed by the greater risk of armature breakdown caused by a faulty bearing. Bearings inevitably wear; therefore, such breakdowns are inseparable from motors with narrow air-gaps.

Price is the least consideration when one has to be responsible for the upkeep of the motors; hence cut prices and extra high speeds are avoided. On the other hand, very low-speed motors are unsuitable, on account of their size, for general hire work.

British motors are obtainable which fulfil most if not all of the above conditions.

It is unfortunately a fact that motor starters have not yet reached a very high state of perfection; the author has not yet been able to find one which combines a good resistance element with sound switchgear. Undoubtedly carbon with its negative temperature coefficient is the right material for starting a large motor. The largest motor on the author's mains is one of 250 H.P., which is started with a carbon resistance. This motor has a rope drive, and on the first contact takes 100 amperes. This current slowly increases and the motor begins to strain at the ropes until at about 160 amperes it slowly starts to move. Not only does such a start save unnecessary shock to the conductors of the motor, but it minimises the disturbance to the supply.

Starters are mounted on a wooden board plugged flat on the wall and covered with asbestos-cement sheet. All wires are carried on the face of the board and fixed neatly with cleats. Mains are also run on cleats, a short run of screwed tube only being used from the starter to the motor.

The author wherever possible prefers a belt drive to any other (except for heavy drives, where ropes are preferable).

Motors are preferably fixed on the floor, as they certainly receive more attention in this position. Occasionally there is no alternative but to mount them on brackets or hangers, or to hang them inverted from the ceiling.

For large motors, say over 50 H.P., which cannot be easily replaced at short notice, it is advisable to keep a spare armature and field coil. In the case of a large mill with a number of similar groups the author recommends the installation of duplicate motors as far as possible throughout, keeping one complete motor as a stand-by.

In opening the discussion, Mr. T. ROLES (Bradford) stated that the prime cost of the motors—both A.C. and D.C.—at present hired out by the Bradford undertaking, was about £53,000, the largest machine being of 300 H.P., and the smallest ½ H.P. The Bradford hiring rates had never been increased or reduced since the hiring scheme was inaugurated, except in connection with some of the larger sizes of motors. He did not encourage consumers to adopt the hire system for motors of over 30 or 40 H.P. Quite a number of consumers in Bradford had bought their motors outright rather than continue to pay hire for them. He thought that the annual charge for hire should not be less than 15 per cent. on the total cost of the motor, slide rails, and starter, seeing that the rental had to cover repairs, maintenance, inspection, interest, and depreciation, and that, based on a 15 years' life, from 8 to 9 per cent. of the total cost would be required annually

for interest and depreciation alone. Since 1906 hired motors had been depreciated yearly on the basis of 6 per cent. of their prime cost, and at the present day the hiring department was in a very satisfactory financial position. Brushes had to be paid for by the hirer, as had also the cost of any extraordinary damage which a motor might sustain. Practically all repairs were effected in the department's own works. He thought it very desirable that a hiring scheme should be in operation in connection with an electricity supply undertaking.

Mr. C. E. ALLSOPP (Bradford) said that in Bradford, for the year ended March, 1915, there were approximately 1,100 motors on hire, representing about 4,139 kW., out of a total number of 2,551 motors on circuit. At the present time the number of machines on hire was 1,262, representing 7,337 kW., an increase of 162 motors and 3,198 kW. in less than twelve months. They fixed plates on the motors stating that they were hired; this precaution was necessary in case of bankruptcy. The weight of the motors was also stamped clearly on the machines. In Bradford they found that a six-hour test was more than sufficient. He commented upon the necessity of having a highly efficient repair staff, and said that in Bradford they made their own coils readily at a very much lower cost than would be entailed by purchasing them from the makers. It was quite possible to standardise starters from 5 to 20 H.P. with interchangeable overload and no-volt coils, and he recommended "asbestos" covering for the coils in case of anything going wrong with the motor. Speaking from experience, he wished every machine they had at Bradford was fitted with ball bearings. By adopting ball bearings the air gap could be considerably lessened, with very good results. He had had considerable trouble with white-metal bearings; at Bradford they had had a number of machines running for years with both bearings, and he voted for the gun-metal mixture or the ball bearing.

Mr. R. H. CAMPTON (Dewsbury) did not think it worth while to hire motors for cranes and hoists. With regard to ball bearings, he had found that the repairs in connection with them were very costly.

Mr. W. B. WOODHOUSE (Dewsbury) said that to make one charge cover all services seemed to him, from the commercial point of view, an ideal arrangement. He had come to the conclusion that 20 per cent. was a reasonable figure, but when this was put to the Yorkshireman he preferred to buy his motor rather than hire it. At the outset electric driving had been hampered by manufacturers, wiremen, and motor men all giving advice, the power user coming to the conclusion that it was an unsettled sort of business, and the engineers did not quite know what they were doing. The second portion of the paper was as valuable as the first, because it was good to know what troubles one met with, and how they should be dealt with.

Mr. W. M. SELVEY (Sheffield) said that one of the most vital matters was the question of the size of motor. By putting in too large motors they got bad power factors and wattless currents.

Mr. W. LANG (Leeds) said that in Leeds, when the Corporation proposed going into this business, very strenuous objection was raised by motor manufacturers and electrical contractors.

The CHAIRMAN, Mr. H. H. WRIGHT, said that the rates charged by the hiring company appeared to be exceedingly high as compared with those of corporations in the district, and that being so, he thought the profits of the company ought to be larger. He thought it best to arrange a minimum period of twelve months' hire, so that they knew exactly where they stood. He did not think it paid to insure motors with an insurance company, provided the machines were reasonably looked after; the insurance rentals against breakdown worked out at something like 5 or 6 per cent., and he knew many cases where there had not been any repairs for five or six years. He agreed with Mr. Allsopp in regard to bearings. At least 90 per cent. of breakdowns were due to oil getting on the windings. He considered it to be very important to have a clause inserted in the hiring agreement whereby, in case of the bankruptcy of the hirer, the landlord could not distrain upon the motor; the same thing would apply to a mortgagee of the property.

The AUTHOR, replying to various points raised in the discussion, said that at Hawick the power users did not want to be bothered at all with their drives, but turned the whole thing over to the company, with the result that they did not quibble about little matters. The company practically undertook to insure the whole of their drives, and provision was made for such contingencies as bankruptcy. His principal objection to ball bearings was that they could not be handled quickly; undoubtedly, if white-metal bearings let them down, they let them down badly, but they had not found much trouble from that cause in actual running. An objection to phosphor-bronze bearings was that when they seized, they seized badly. During the past five and a half years the drives at Hawick had got larger, particularly in the hosiery industry, with the result that one was continually changing the size of one's motors in the mills. At Hawick they had not had any trouble with contractors, because they had not any in the town, though they had had to make a firm of manufacturers feel rather uncomfortable when they attempted to quote prices representing 334 per cent. off the proper charge, whilst his company were hiring motors out to customers at a higher figure.

THE USE OF CONTINUOUS CURRENT FOR TERMINAL AND TRUNK-LINE ELECTRIFICATION.

DISCUSSION AT BIRMINGHAM.

Mr. STORER's paper was read before the BIRMINGHAM LOCAL SECTION OF THE INSTITUTION OF ELECTRICAL ENGINEERS on March 15th. An abstract of the paper was printed in the ELECTRICAL REVIEW of March 24th and 31st.

Dr. C. C. GARRARD said that the paper appeared to be largely a plea for standardisation of railway equipments in this country, and the suggestion was made that this matter should be taken in hand by the Institution of Electrical Engineers. Mr. Storer was of a somewhat sanguine temperament if he thought that this would be done. The Institution had not a standardisation committee or any other machinery whereby this and other problems could be dealt with. The American Institute of Electrical Engineers had such standing committees, and there was no doubt, to his mind, that the development of electrical engineering in this country was hindered by the failure of the Institution of Electrical Engineers to take the lead in such matters. The Engineering Standards Committee dealt with such a wide field that electrical engineering could only receive a small portion of its time and attention. These important electrical problems should be tackled by the Institution, which could put them into such shape that they could be presented to the Engineering Standards Committee as the considered view of the electrical profession. The Engineering Standards Committee would then see that the views expressed fitted in with those of other branches of engineering, and could eventually adopt them as a British standard specification. If this scheme could be arranged, he was sure progress would be greatly accelerated.

Mr. F. W. CARTER said there was in some quarters, even now, a disposition to argue in favour of shunt or separately-excited motors, but, from an operator's point of view, the series motor was the only thing possible. He would like to have from the author a more explicit statement of the service conditions which he considered justified the use of field control. If s were the maximum permissible speed of the train, in miles per hour, D the diameter of the motor-driven wheels, in inches, x the ratio of gear reduction, and N the maximum speed of the armature in R.P.M., these quantities were connected by the following equation:—

$$s \times 88 \times 12 / \pi D = N.$$

The quantities s and D might be considered as being specified, whilst a maximum limit could be assigned to N by the designer. If, now, the motor were designed so as to use a larger gear reduction than that given by the above equation, the armature speed would sometimes pass beyond desirable limits, whilst if the gear reduction were less than that given by this equation the motor was not used to the limit of its mechanical capacity, and could be made more efficient or lighter or of greater capacity by reducing the number of armature bars, until the appropriate gear reduction satisfied the above equation. By starting the design with this equation, therefore, and deducing the number of armature bars in accordance with it, the most effective use was made of the active material. The above applied whether the motor was designed for operation with a single field or for field control. For a particular service, the comparison between motors must be based on the assumption of approximately similar characteristics on the normal fields; if it were desired to compare the operation of a particular motor with and without field control, it was necessary to use a greater gear reduction for the field-control motor; but from the discussion given above it would be clear that in this case either the field-control motor ran to a higher speed than was desirable, or the saturated-field motor could be improved by redesigning it so as to satisfy the equation given above; that was to say, the gear reduction was either too great in the field-control motor or too small in the other. The comparison between field-control and saturated field motors should not be made on the basis of using the same motor in the two cases, but on the basis of the best motor a designer could offer in the respective cases. Under these conditions the field-control motor would be somewhat heavier and more expensive than the saturated field motor. To sum up the advantages and disadvantages of field control, the advantages were as follows:—

1. There was a saving of energy, as explained by the author.
 2. For locomotive-hauled trains there was an increase of flexibility, which was not only desirable but necessary in many cases.
 3. For multiple-unit trains it frequently enabled an otherwise unsuitable motor to be employed by using it nearer to the limit of its mechanical capacity.
 4. It enabled trains to meet special speed restrictions outside the ordinary schedules.
- The disadvantages of field control when comparison was made on the basis discussed above were:—
1. The motors were heavier and more expensive.
 2. They were slightly worse in operation on account of the weakened field.
 3. The control equipment was heavier and more complicated. In many cases field control had not shown sufficient advantage over the ordinary series-parallel control to justify its use. At

the same time, it was frequently a valuable feature of which advantageous use could be made. With regard to the author's conclusions, whilst standardisation was highly desirable from some points of view, he could hardly blame the railway companies if they were indisposed to admit this at the present time; the advantages of higher D.C. voltage were too recent to justify them in concluding that finality had been reached, and, in fact, the system using 5,000 volts was only of last year's development. It was pleasing to see that the author referred to the 600-volt system as not only being thoroughly established, but as being so well suited to the requirements of terminal electrification that it should be continued as one of the standards, at least for the present. This was the oldest system in use for operating railways, and there was always a disposition, when something newer appeared, to consider that it was superior to the older and necessarily superseded it. If, however, the question of electrifying such a system as the London underground railways came up at the present time, the sound considerations given by the author, where he said: "The determining factor in the entire question will, of course, be the cost, not only of the original installations, but the cost of operation and maintenance," would lead to the same solution as was arrived at by the Underground Railways Co. at the inception of their project. The author's final paragraph was important. In this country the main lines and the local lines were very largely distinct, and if one system of operation were considered best for local service and another system for main line service, the two systems would be largely concerned with separate tracks; if a different system of line conductors were considered desirable for the two classes of service, the few lines which it would be necessary to equip with both systems of line conductors would add little to the cost of the installation, as compared with the additional expense that would be incurred in adopting an unsuitable system of operation either for the main line work or for the local work, in order that a single system of operation might be employed throughout the railway.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Foreign Trade Successes.

You have frequently emphasised in the columns of your paper the necessity for the expansion of foreign trade, and therefore we think you will be interested in the following list of orders received by this firm from abroad during the last few weeks:—

Country.	Goods.	Value.
France	Switchgear and transformers	£15,000
Denmark	Transformers and meters	7,000
Holland	Transformers and switchgear (including 24,000 K.V.A.)	3,500
China	Meters	8,000
Russia	Instruments and meters	2,500
Spain	Meters	1,500
Australia	Meters	4,000
S. America	Meters	1,000
India	Meters	1,500
Other Countries	Meters	2,000
		£46,000

Ferranti, Ltd.

London, W.C., April 1st, 1916.

Canada and the Metric System.

No one who has had a scientific training can doubt the enormous advantage to British traders of changing to a decimal system, and the writer is in very hearty accord with the effort at present being made by the *Electrical Review* to give prominence to this extremely important subject.

In order that the fullest possible benefit should be derivable from such a change, however, the whole of the British Empire should partake in it, and to that end it would be necessary to enlist the sympathies of the people of the Dominions. In the case of Australia, New Zealand, and South Africa this might not be so difficult; but Canada, owing to her proximity to, and intimate relations with, the United States, is in a different position, since it is not certain that Canada's big Southern neighbour would care to follow in the lead of the British Empire, and if she did it would make the task of British traders just that much harder, since the United States would have gained the same advantage in dealing with the world's markets. At the same time this is not a very strong argument for keeping Canada out of line with the rest of the Empire, since her business men could more easily adapt themselves to the needs and requirements of the United States if the systems of weights and measures, &c., were different in the two countries than they can at present to those of

some far-away country like Italy, Spain, or France, especially as there would be, in the former case, the supreme advantage of a common language.

Canada, like the United States, is in the rather awkward position which arises out of having adopted a decimal system only in a few directions, leaving others entirely unchanged.

The money, of course, is decimal, but articles are still sold in dozens, and to reckon out how much 24 dozen buttons are worth at, say, 17 cents each, is quite an arithmetical feat for a former inhabitant of the Old Country, and, it is suspected, does not come any too easy even to a native.

Again, the measures of length are the same as at home, but the hundredweight is 100 lb., and the ton is 2,000, which latter are certainly improvements where decimal money is used, but the ounce is unchanged, making the reckoning of the cost of lb. with odd ounces an awkward item.

Cantuck.

[Our correspondent writes of existing conditions. But what of the future? What if the United States takes the initiative and adopts the metric system before we do? Already the medical work of the U.S. Army, Navy, and Public Health Service is carried on wholly in the metric system, so is that of the Bureau of Standards and other scientific departments; the system has been adopted in the Philippines and Porto Rico; scientific, engineering, and industrial organisations have urged Congress to take action; the U.S. Department of Commerce is in favour of it; and the movement is steadily gaining strength. If the United States decides to make the plunge, can the British Empire stay out in the cold?

Australia and New Zealand long ago advocated the adoption of the metric system throughout the Empire, and the Colonial Premiers in Imperial Conference have passed resolutions to the same effect. If we do not move soon, our rivals will—and then, as usual, we shall be "too late."—Eos. Elsc. Rev.]

Cause of Flicker.

We note the suggestions made by your correspondent, Mr. J. W. Long, that the flicker in the light may be due to faulty valve setting causing unequal distribution of steam; also, that Mr. Bulsara should write to us for enlightenment and guidance. Concerning this, we have to say that, although at various times during the past 15 or 20 years a number of cases of flicker have come under our notice, in no case have we known the trouble to be traced to defective valve setting or to be remedied by readjusting the valves. We hardly see how the comparatively slight inequality due to a slide valve being out of position could produce such a result with the liberal proportion of fly-wheel effect and the fine degree of even turning there is with a high-speed steam engine, bearing in mind that in times past, at any rate, electric generators have been successfully operated by high-speed "single-acting" engines. If faulty valve setting or slight looseness in the valves could produce such an effect, complaints of flicker in the lights would be far more common than in our experience they are.

Belliss & Morcom, Ltd.

Birmingham, April 3rd, 1916.

Electricity in Agriculture.—Miss E. C. Dudgeon,

of Lancelton House, Damfries, has during the past few years carried out a number of interesting experiments in the growing of crops by means of electricity. The results she has attained in the case of potatoes were very marked. In 1912, the yield was 10 cwt. 3 qr. more per acre than without the electricity; in 1913, 13 cwt. 3 qr. more; and in 1914, 1 ton 3 cwt. more. Last year the oat crop was experimented with. From the very commencement of growth, the oats under electrical treatment showed a conspicuous difference, and they did not suffer from the prevailing drought to the same extent. When the crop was harvested there was a difference of 31 per cent in grain and 63 per cent in straw in favour of electrified oats. Miss Dudgeon considers that the experiments justify the following conclusions:—(1) That under the influence of the electric discharge the ingredients and the soil necessary to plant growth are rendered more soluble, and therefore more easy of assimilation; (2) that by the aid of electric current sap is enabled to flow more vigorously and the formation of sugar and starch is increased; and (3) respiration, absorption, and evaporation are accelerated, and by increased chemical activity in the plant its whole fabric is improved. With regard to the cost of electrical treatment of crops Miss Dudgeon considers there is no reason to doubt that the apparatus required, and its method of working, will come well within the means of any practical farmer who has a little knowledge of the subject, and that the increase of crop will repay with interest the outlay entailed.—*Aberdeen Journal*.

Russian Government Electricity Measure.—A

Government conference has been held on the supply of electricity. It was shown that with the existing scarcity of fuel it was necessary to consider at once the means of assuring a supply of electrical energy which would aid in solving the motor difficulty. It is proposed to use liquid fuel (petroleum) in place of the coal that cannot be got. A project of law to this effect, already drafted and published, has been approved.

TECHNICAL EDUCATION AND INDUSTRIAL RESEARCH.

MANY wild statements have been made during the past 18 months on the subject of education, science, and research, and there have arisen schools of theorists with enthusiasm as their virtue and vagueness as their fatal defect. The national crisis has aroused them to well-meaning frenzy and secured a wide and sympathetic hearing for their proposals, particularly amongst those who, from previous ignorance, are unable to discern beneath the attractive surface of so many of these sweeping proposals a lack of definition and a failure to analyse the needs of the case, and correlate them with practical possibilities. Too many sovereign cures have been recommended with too little justification, and too much faith has been pinned on vague schemes for State aid and private organisation, whilst overlooking the fundamental importance of individual effort. Science has been regarded as a panacea for all ills, and there has been a tendency to forget that not only the general organisation and higher commands of the industrial army, but also the vast body of that army itself must receive attention. Those who begin life as manual workers must—with exceptions which are important in themselves, but almost negligible in point of numbers—remain manual workers to the end. In order that they may make the best of their opportunities and render the greatest good to productive industry, it is necessary that these workers receive suitable education during the critical years between the time they leave school and the time when their attitude towards industry and their position and prospects therein may be regarded as fairly definitely fixed. As pointed out by various speakers—Dr. W. Garnett and Mr. A. P. M. Fleming amongst them—at a recent discussion by the Circle of Scientific, Technical, and Trade Journalists, there is insufficient discrimination in our existing facilities for technical education between the needs of the leader of industry, the technical expert, the works manager, the foreman, and the skilled worker. Provision is already made more or less satisfactorily for the technical education of non-manual workers in the industrial army, but the needs of the manual worker are sadly neglected.

In this matter, which primarily affects juvenile workers, responsibility rests with manufacturers themselves, and, whilst Dr. Garnett emphasised the necessity for more practical education in schools, Mr. Fleming drew attention to the benefit accruing to workers and employers alike from works schools. Having investigated the problem, if only on the ground that it is a sound commercial proposition, the employer must provide the necessary training himself or make his voice heard in demanding that this kind of education be provided. In either case, the employer must contribute at least to the extent of granting juvenile workers class-time during working hours, for it is physically impossible that such workers should study hard and effectively during what should be their leisure hours.

Apart from the more or less specialised education of industrial workers, Dr. Garnett makes an urgent plea for the wider diffusion of popular science. Broad education of the general public, both at school and by popular lectures, would secure a more intelligent and sympathetic appreciation of industrial and scientific needs, conditions, and proposals; it would aid fathers in selecting a definite training and aim for their children; and it would bring home to legislators and capitalists the fact that every scientific discovery sooner or later finds its place in industry.

Following upon the question of education, which is its indispensable precursor, comes that of research. Purely scientific research should never be confused with industrial research; nor should either be regarded as of minor importance. Both are to be encouraged by every means at our disposal, but with this important distinction, that the pure scientist exploring unknown fields in search of knowledge for knowledge's sake cannot usefully be subjected to any organisation or restraint, whereas industrial research is mainly directed towards the solution of definite industrial problems, though it may yield incidental scientific discoveries. Numerous instances quoted by Mr. Fleming show, if further proof be needed, that industrial research on a large scale and well organised is always a commercial proposition. There are now upwards of 50 corporations in the United States having research laboratories costing annually from £20,000 to £100,000 each for maintenance. Recent advances in long-distance wireless telegraphy have been due largely to work in the Western Telegraph Co.'s research laboratories; the rustless sheet-iron of the American Rolling Mills Co. is a research laboratory product; a new industry for the manufacture of commodities from synthetic resins had its inception in the scientific work of the General Bakelite Co.; and half-a-dozen new factories have been started as the result of discoveries in Edison's laboratories since the outbreak of war. To quote Prof. Gregory, industrial research is primarily a commercial matter, and will be taken up by all our big firms directly they realise how profitable it is. The pure scientist, however, cannot be chained to any particular research, yet his work may be of far greater value than any industrial research. In Faraday's "magnetic spark" there originated every central station in the world to-day, and from Maxwell's electromagnetic theory of light there came the Marconi trans-Atlantic wireless stations.

Between the inception of a purely scientific investigation

and its application to industry there lies generally a wide field demanding much patient labour before a track can be beaten across it. The first fact to be realised is that the several stages in the completed task are all equally important. Each must be encouraged—in spirit and by act—and the final fruits of labour must be distributed equitably between all the workers concerned. The original inventor or discoverer and the originator of the commercial application of his results should both share in the profits, and if the intermediate work has been aided by public funds it is only fair that the State should also participate in profits in order that further progress may be made in similar manner.

College laboratories may be more usefully employed than at present in the conducting of purely scientific research and in the performance of "scientific work to order"—the order being placed by industrial firms and ultimate profits being divided between the firm, the college, and the research worker. One of the most important functions of the Advisory Council for Research seems certainly to lie in organising, classifying, and supplementing existing facilities for research in public institutions, and in bringing manufacturers and scientific investigators into close association. It is in the preliminary stages of scientific investigation that college laboratories can be most usefully employed. There are some industries (e.g., leather tanning and process-block making) in which the operations are the same for a single piece of work as for a thousand, but generally the college laboratory cannot undertake the commercialisation of scientific discoveries. Standardisation work and the testing of materials are provided for by the National Physical Laboratory, and appreciation of the sterling services rendered by this institution is extending rapidly.

There remains, however, a most important class of work, and one for which additional facilities must be provided in this country. These facilities should take the form of monotechnic institutes equipped for undertaking experimental work under commercial conditions, on a broader basis than the industrial research conducted by individual firms, and in the interests of all members of a particular trade or group of associated trades. Manufacturers would not be called upon to reveal secrets they already possessed or might thereafter discover, and they would certainly gain more than they would lose by sharing with others the knowledge acquired by combined industrial research. The cost of special trade research institutions could be met by a purely nominal levy on the capital of firms interested—for instance, an annual subscription of 0.1 per cent. on the capital invested in engineering works would yield about £300,000 per annum for research institutions and research workers—but in certain directions it would probably be expedient to provide State subsidies. There are, for instance, many researches of great importance to a large section of industry which fall outside the scope of pure science and are not of such a nature as to justify a single firm in undertaking the work at its own expense. It would, then, be equitable to credit the State with a proportion of the profits derived from the results of work conducted under subsidy. This could be done by State patents, or other means, and in the course of a few years fresh subsidies should be covered by research revenue. It would be necessary also to protect the interests of the research workers themselves and to provide against their disposing privately of information acquired during their investigations.

The danger particularly to be averted is that of relying too much on State organisation and aid, particularly at the present time, when technical education and research have still to be given really practical effect in this country. It cannot be emphasised too strongly that the main-spring of the movement is, and must be, the employer (particularly the manufacturer) himself. Manufacturers must abandon their policy of isolation, for there is no longer anything "splendid"—much less profitable—therein. Trade associations should be organised to secure suitable educational facilities for their employes (present and potential) and to make the best use of trained men supplied by trade schools and colleges. The question of the manual worker's education is one of extreme importance, and should be solved in detail by each employer, though his trade association could, and should, furnish much valuable assistance. The same trade associations should concern themselves with superintending the research work in which they are interested and in collecting and distributing information among their members. They should keep in close touch with the Advisory Council for Research, and should endeavour to frame their policy in conformity with arrangements made for industrial research as a whole, but, if State aid is not forthcoming promptly enough and in suitable manner and degree, it is the clear duty of trade associations to frame schemes for independent action. It is of the utmost importance that individual and concerted trade action be taken at the earliest possible moment, always, however, with a view to supplementing present and future central action on a national scale. It would be as foolish for trade associations to do otherwise than aid in building up a central national organisation, as it would be for the latter to take definitely effective measures without the co-operative help of individual trades. The intimate acquaintance of trade associations with the actual needs and conditions of the industries they represent is indispensable, and these mobile associations should set to work to define and supply their own needs as far as possible and to aid in building up an effective central organisation.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

FRENCH WEST AFRICA. New Customs Regulations have been established by a recent Presidential Decree. They are based on the Customs Legislation in force in France in so far as the latter can be adapted to the local necessities of the Colony, and deal in detail with the procedure to be followed in respect of the importation, exportation, transit, and warehousing of goods (including provisions as to the declaration of goods for Customs purposes), the procedure in cases of dispute as to the kind, quality, origin, or value of imported goods (*expertise*), &c. The complete text of the Regulations may be consulted at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

PERU.—A new Law, dated December 29th, makes provision for the increase of the Customs duties levied on certain goods imported into Peru.

The following goods, which have hitherto been on the free list, are to pay import duty at the rate of 10 per cent. *ad val.*:—Tin in bars and sheets; lead in bars or in unserviceable articles; steel cylindrical axes; liquid mercury; copper, brass, or bronze, in bars or sheets; asbestos or asbestos yarn, asbestos cement; steam boilers and feed pumps for same; passenger cars for railways or tramways, with any motor; locomobiles and locomotives with or without boilers; cranes.

Duty at the rate of 5 per cent. *ad val.* is payable on the undermentioned goods:—Steel bars; hoops of iron or steel; wire cables (hawseers); zinc in bars; iron sheets from 3 to 15 mm. thick; steel wire; round wire or wire resembling ribbon.

The following goods are to be subject to import duty at the specific rates shown:—

	Per kilo.
Machines of all kinds, hitherto free of duty, weighing up to 100 kilogs. (gross weight) ...	10 centavos.
Machines of all kinds, hitherto free of duty, weighing more than 100 up to 5,000 kilogs. (gross weight) ...	5 centavos.
Machines of all kinds, hitherto free of duty, weighing more than 5,000 kilogs. (gross weight) ...	2 centavos.

Among the goods that will continue to be admitted free of duty are irrigation pumps.

The Ministry of Hacienda is to fix, within 90 days from the promulgation of the Law, the specific rates of duty which are to be assessed as the equivalent of the 10 per cent. and 5 per cent. *ad val.* rates mentioned above. For the purpose of converting these *ad val.* duties into specific rates, the prices current before the outbreak of the war are to be taken as the basis.

The Law also provides for the following, among other, modifications of the tariff of fees charged by Peruvian Consular Offices:—

The fee for the certification of the four copies of each invoice of goods shipped to Peru is increased from 1 per cent. to 2 per cent. of the value of the goods.

The charge (under No. 46 of the Consular Fee Tariff) for certification of the copies of ships' manifests is suppressed, and in substitution therefor the fee for the legalisation of signatures (2 soles) is to be levied for the visa of such documents.

For the certification of manifests for cargo that has to be transhipped, the fee for the legalisation of signatures is to take the place of the fee prescribed in No. 47 of the Tariff.

No. 48 of the Consular Fee Tariff, which provides for a fee of 50 centavos for the certification of the two copies of the general manifest, or of each one of the various manifests that, according to Article 113 of the Consular Regulations, must be presented by the captain of the vessel to which the merchandise has been transhipped, is to remain in force.

The Law further provides that a special duty of 20 centavos per 100 kilogs. (gross weight) is to be levied on all goods (with the exception of bulky goods which are cleared without entering into warehouse) imported through the *Callao* and *Mollendo* Custom Houses.

[Note.—The Peruvian sol (100 centavos) is equivalent to 2s., but for Consular Tariff purposes it is taken as 48d. sterling.]

NEW PATENTS APPLIED FOR, 1916.

THE CONSERVATION OF NATIONAL RESOURCES.

THOSE of our readers who study the technical Press of the United States are familiar with the importance which in recent years has been attached to the subject which forms the title of this article by our Western cousins. Not only has the waste of material resources such as timber and coal been freely denounced in that great country, which possesses such enormous reserves of these priceless treasures, but also the punishments which Nature remorselessly inflicts upon those who misuse the riches which she has lavished upon them in prodigal profusion, have been the subject of discussion—such as, for instance, the denudation of the land by rainfall when it has been unwisely divested of the protecting mantle of forest growth; and the wealth of water-power which is running to waste, while coal, oil, and gas are consumed at low efficiency, has received the attention of the leaders of the industrial world and of the Government.

If, in a time of profound peace, a country so lavishly endowed with natural resources should be gravely concerned as to the abuse of those treasures by its inhabitants, how much more urgent is our obligation to scrutinise minutely the manner in which the natural resources of these islands are utilised, at a time when the heaviest financial burdens ever laid upon a nation have to be borne by us, to ensure the triumph of our cause, and when we have to face the certain prospect of industrial competition of unprecedented severity in the years that will follow that consummation of our aims. Surely it is our duty to examine in every phase the methods of production and utilisation, especially of the fuel which constitutes by far the most important store of natural wealth in our possession—the factor to which is primarily owed our evolution from an agricultural community to the leading industrial nation in the world.

The subject has many times been dealt with in our columns, but never before has its importance been so pressing or its urgency so obvious as it has now become; and we are glad to know that leaders in the scientific and industrial spheres, such as Professor Bone and Sir R. A. S. Redmayne, are endeavouring to direct public attention to the question. The work of the former in the development of more economical methods of heating with gas is well known to our readers; the latter, H.M. Chief Inspector of Mines, is more immediately concerned with the extraction of our black diamonds from their age-old matrix, but in his presidential address to the Institution of Mining and Metallurgy last month he broadly reviewed the mineral resources of this country, unrivalled in their number and variety, and insisted upon the imperative necessity of the conservation of coal by the prevention of waste both in getting and in using it. With each of these operations the electrical engineer is intimately concerned.

As regards the extraction of the coal, the progress of electrification of the coal mines in the recent past has been so satisfactory that we need not dwell long upon this phase of the subject; not only is the adoption of electric lighting and power

H. ALABASTER, GATEHOUSE & CO.,
4, Ludgate Hill, London, E.C.

for ordinary purposes proceeding apace on all progressive properties, but also the number of electric haulages and electric coal-cutting machines in use is steadily increasing, and the use of electric power for main winders has passed the stage of experiment—in spite of the efforts of some faint-hearted electrical engineers who upheld the superior advantages of steam—and has established itself on the basis of proved merit. Not only do these methods reduce the consumption of fuel, but also they enable thinner seams to be worked to commercial profit and diminish the amount of coal abandoned in the pit or cut to waste.

But it is in connection with the use of coal that by far the greater scope for economy is found. Even if we ignore the fact that only at most about one-fifth of the energy contained in the coal can be utilised in steam engines, or one-third in the more costly gas engine, it is estimated that two-thirds of the coal consumed in industrial works is wasted owing to the employment of obsolete and inefficient methods and plant. Sir R. A. S. Redmayne refers to the appointment by the British Association of a strong committee to consider the whole question from a national standpoint, but considers that the matter is of so great importance that it should be undertaken by a State Commission provided with adequate funds and the whole-time services of able chemists. No electrical man will be surprised to learn that he comes to the conclusion which is reached by every engineer who studies this problem—that the more economical consumption of fuel for the production of energy depends upon the more extended employment of electric motive power, distributed from large generating stations in which the fuel is used most economically under the direction of highly skilled experts. *The centralisation of production and transmission lies at the very foundation of progress towards the conservation of our national stores of fuel.* This is no new doctrine; it is that taught by Ferranti, its first and most enthusiastic champion, and supported by such men as Insull, Merz, Pearce, Chattock, and other leaders in the electrical world. Wherever it has been carried into full effect, the results have proved its truth beyond all doubt. In this country, most unfortunately, the generation and distribution of electrical energy, with rare but instructive exceptions, is subdivided amongst innumerable undertakings of comparatively small dimensions and limited scope for development, thanks mainly to the craze for municipal ownership which for over 30 years has crippled the progress of the industry in this country, by maintaining a high cost of production and thus hindering the general adoption of electrical energy for all purposes, by preventing our manufacturers from developing the design and production of electrical plant on the grand scale in vogue abroad, and consequently by restricting the inflow of capital into an industry in which we for a time led the world. These facts are fully appreciated by Sir R. A. S. Redmayne, who points to the necessity of financial outlay on a large scale, and of legislative assistance to facilitate, if it cannot compel, the co-operation of municipal and private enterprise to carry the policy into effect. His views are in accordance with those which we have so long upheld in these columns, and we trust that the attention which is now being directed to the subject will bear fruit in the speedy liberation of the electricity supply industry from the toils by which it has hitherto been harassed.

Rubber. RATHER more conservative views have been of late ventilated in some quarters as to market prospects in crude rubber for the near future, which has been quite in keeping with the downward tendency in values within the last few weeks. Current prices,

however, are still well above the lowest point reached at the end of January last, and the market looks like displaying more resisting power, while the demand throughout has continued on a fairly active scale. The price of spot fine plantation descriptions has dropped to a little under 3s. 4d. per lb., but the fact is worth noting that the fall has been accompanied by a decrease in the London stocks, thus indicating that the outlet has been stimulated at least to some extent at the lower level, while holders have evidently met the demand more freely. This policy has no doubt been prompted by the fact that very liberal quantities were already tendered against contracts maturing this month, which naturally tends to remove all apprehensions as to a renewal of tightness for some time to come. Not only are large quantities afloat, but consumers and importers on either side of the Atlantic undoubtedly hold fair stocks against urgent requirements that may arise in the course of this or next month. The remarkable strength of the position in the early part of this year was probably due in some degree to the rather oversold condition of the market at a time when the shipping situation was the subject of more particular uneasiness. There is now certainly less alacrity on the part of consumers to provide for their prospective needs pending further developments, but the postponement of orders in various directions means a slow accumulation of buying power later on. Recent heavy arrivals having synchronized with a reduction of the stocks and a fall in prices, precisely the reverse is liable to occur should anything happen to encourage the nursing of part of the future arrivals. While there is now a good supply of the commodity to meet all requirements in the home trade and for export, the outlook as regards shipping is not altogether free from anxiety. There have been delays to contend with in the arrivals, but no losses at sea lately with the exception of one boat last week, with only a limited quantity, however. The total shipped last month from the Federated Malay States amounted to 4,429 tons, this showing a reduction of about 800 tons against the previous month, and making an aggregate of 14,197 for the three months, which compares with 10,302 tons and 7,321 tons for the same period respectively in the previous two years. The fact deserves notice that the ratio of increase so far this year has been much greater than last year, thus testifying to the excellent progress of the plantation industry. The trade outlook across the Atlantic continues eminently satisfactory, and the continuance of a huge outlet there seems assured, which constitutes a big factor in the situation although the plantation output is steadily increasing.

Falling Trees and the Maintenance of Wires.

THE blizzard which swept the country in the early days of the present month did considerable damage to electric wires and poles. Questions have already arisen as to who is liable for the damage caused to persons using the highway; and difficult problems are sure to arise as to who is liable to make good the damage caused by falling wires and poles, whether used for telegraph, telephone, or electric power. One such problem has already been brought to our attention by a correspondent. An engineer had undertaken to maintain and keep in repair certain poles and wires for a power company, and had given an indemnity in respect of all liability which might be incurred by the company owing to failure to maintain. A pole fell during the recent blizzard and damaged a cottage. The pole was new, well set up, and well stayed. If a claim is made by the cottage owner, can the engineer be sued on his indemnity? In the first place one has to consider whether the cottage owner has any right of action. This question depends upon a well-known principle that anyone who brings on to his land something

which may in certain circumstances be a source of danger, cannot escape responsibility if it causes damage even as a result of the act of God. In the present instance the pole, bearing certain heavy wires, was presumably built on land of the company in such a position that if it fell it would injure the cottage. In such circumstances the company would be liable. On the contrary, if a tree growing on their land was blown down and did damage, they would not be liable, as to grow a tree is to make a natural use of land. But the fact that the company may be liable does not necessarily give them the right to sue on the indemnity. So far as appears from the facts stated by our correspondent the fall was not caused by the failure to maintain but by the blizzard—a very different matter. For all ordinary casualties resulting from the failure to maintain he would be liable, but not for the consequences of an unprecedented storm.

One Too Many.

THE British Manufacturers' Association, which was formed a year ago, held a meeting at Cannon Street Hotel last week. What struck us as one of the most singular features of the gathering was the complete silence observed by the speakers concerning other efforts which are on foot to establish a great organisation of British manufacturers. There may have been very good reason for running separate movements up to a point, but, as we stated last week, if the manufacturing interests of the British nation are to deal effectively with the unique position which confronts us all, and are to carry weight with the Government and the public, they should act in union, bringing their great combined influence to bear through one strong representative organisation. Some of the speeches must have terribly bored the majority of those present. The Association has issued a booklet, "Better Times for Working People," for the education of the workers, and it has very definite ideas as to what the Government ought to do to prevent a great German "after-the-war dump." Some of its spokesmen are votaries of co-partnership, which English masters have been so slow to adopt, and which working people through their unions have so often treated with suspicion. The idea of convincing the worker that the interests of Capital are the interests of Labour too, and that both parties should therefore pull hard together, is excellent at any time, but surely for that sort of propaganda one hardly requires a "British Manufacturers' Association." Nor does one want another association to petition the Government to set up a Ministry of Commerce. If the new association was intended to serve the purpose of a sectional body to represent some particular trade, or some particular object, and were to connect up to whatever main body may emerge from the deliberations referred to in our leader of last week, it would be more welcome than it is in setting itself up under so ambitious a title as though it were the only pebble on the beach. One of the speakers, who is connected with the electrical trade, referred to the need that exists for one manufacturers' organisation which should be sufficiently powerful to stand against all opposing forces. One could only imagine that those responsible for the gathering were unaware of the important movements which have been making such substantial progress in recent months. To anybody who has closely followed the course of affairs, the proceedings were not impressive, the speeches were long-winded and unbusinesslike, and certainly many of the audience showed their interest by an early retirement. To be perfectly frank, our own opinion concerning the movement was that it was one too many. While it might fill a useful object if it were to represent particular trades, including leather, it is not needed for the electrical or engineering industries of the country.

THE EFFECT OF THE PRESENCE OF MOISTURE IN GAS COKE FUEL.

BY PAKENHAM BEATTY, A.M.I.E.E., and A. F. SMITH.

THE figures given in the following notes are based upon the results obtained in every-day practice during the consumption of 10,000 tons of gas-works coke, in the boiler house of a tramway power station in Buenos Aires.

FIG. 1.

Owing to the large stocks of coal it is usual to carry in Argentina, it was not until perhaps February of 1915 that the rise in the price of Welsh coal, following on the declaration of war by England, made itself felt. During February and March of 1915 Welsh coal, the normal price of which

FIG. 2.

is about 33s. per ton c.i.f. Buenos Aires, rose to the unprecedented figure of 73s. per ton.

Only in June of 1915 were first-rate American coals such as Pocahontas, New River, and Georges Creek, obtainable

at 45s. per ton c.i.f. and, although petroleum is actually found in Argentina and a supply from Mexico has also been available since the commencement of the war, in the case of large installations where the capital required for the necessary modifications and additions to the plant represented a considerable sum of money, difficulty was experienced in making contracts at a convenient price for such a length of time as would warrant the expenditure involved.

Apart from the appreciable amount sold for domestic purposes in Buenos Aires, gas coke is also largely used in lime kilns, but the general trade depression caused by the state of affairs in Europe reduced the consumption of this fuel to such an extent that it was placed within the reach of the power-house engineer.

The generating station mentioned in these notes consists of two separate plants. The first and older section contains five slow-speed horizontal reciprocating engines, coupled to direct-current generators, giving a total output of 4,500 kw., and nine Babcock & Wilcox marine-type hand-fired boilers, varying in size from 49 to 105 sq. ft. of grate area. The total heating surface of the battery of boilers is 24,710 sq. ft., and the total grate area 651 sq. ft.

The annual production in units is about 16,800,000, and the average total steam consumption per unit generated,

FIG. 3.

including that required for all auxiliaries, works out at about 20.94 lb. A consumption per unit generated of 2.74 lb. of Welsh semi-anthracite coal, with a calorific value of about 14,000 B.T.U. per lb., gives an annual boiler efficiency of about 62.5 per cent. The above figure includes the fuel for banking fires at night, which amounts to approximately 3 per cent. of the total coal used. When coal is employed, a maximum of 22.37 lb. per sq. ft. of grate area per hour is burned, while the average during the 24 hours is 15 lb.

The annual feeder load factor works out to 49 per cent.

The second, or more modern section, of the plant contains two turbo-alternators, each of 1,500-kw. capacity, and four Babcock & Wilcox land-type boilers, each of 76 sq. ft. grate area and 4,020 sq. ft. heating surface, fitted with under-feed mechanical stokers. Economisers are not installed in either boiler house, but exhaust-steam feed-water heaters are used.

Approximately, 10,750,000 units per annum are generated by the turbo-generators, one of which is always running continuously at nearly its normal load. The coal consumption in this case is about 1.975 lb. per unit, the

steam consumption 17 lb., and the annual boiler efficiency 70 per cent.

An analysis of a representative sample of the gas coke used, made by Mr. A. Courtenay Luck, F.I.C.S., gives the following results:—

ELEMENTARY ANALYSIS.		OTHER DATA.	
(Sample dried completely at 110° C.)			
Carbon	88.15 per cent.	Sulphur	1.51 per cent.
Hydrogen	9.1	Volatile matter	lost on heating
Ash	9.81	away from air	2.96
Oxygen and nitrogen by difference	1.1	Calories per kilogram by Mahler bomb, dry fuel	7,589
		British thermal units	13,660
	100.00 per cent.		

The calorific value obtained by the Mahler bomb agrees fairly closely with the calorific value as calculated by formula from the elementary analysis.

The coke was burned under the marine-type hand-fired boilers, and the average results obtained during the consumption of 10,000 tons are set out below:—

Lb. per kw.-hour	3.675
Lb. of steam per lb. coke as fired	5.7
Lb. of steam per lb. coke from, and at, 212° F.	6.72
Boiler efficiency, per cent.	57.6
Ash, per cent.	13.5
Moisture, per cent.	13.0

The ash, on being weighed as taken out of the boiler house, after being quenched, was found to contain 20 per cent. of moisture. The best results obtained were with a large quantity of coke that contained 6 per cent. of moisture, when an average evaporation of 7.9 lb. of steam from, and at, 212° F. per lb. of fuel, was attained during trials extending over a month. After making the necessary deductions for the increased percentage of incombustible matter found in practice, and for the amount of water present, this evaporation corresponds to a boiler efficiency of 62 per cent.

Assuming it were possible to maintain a boiler efficiency of

FIG. 4.

FIG. 5.—PERCENTAGE CO₂ RECORD.

62 per cent., the curve in fig. 1 was drawn showing the evaporation from, and at, 212° F. to be expected, taking into account both the increased percentage of incombustible matter in comparison with that set out in the analysis and the moisture present in the coke. As a result of subsequent trials, all extending over several days, a second or lower curve was constructed, showing the evaporation obtained in practice with varying percentages of moisture.

The loss of boiler efficiency due to the presence of moisture is also plotted on Curve No. 1. It will be noted that with 20 per cent. of moisture, about 55.6 per cent. efficiency is the highest that could be reached.

The curves in figs. 2 and 3 were plotted in order to show the enormous increase in fuel consumption per kw. produced due to the combined effect of the drop in efficiency and the losses expected from the presence of moisture. From Curve No. 3 it is apparent that a 10 per cent. rise in moisture over the normal, which was taken at 6 per cent., meant a 24 per cent. increase in the fuel bill.

In the case of all the evaporation performances in practice given above, the amount of fuel employed for banking fires is included, or, say, 3.5 per cent. of the total amount used.

It should here be mentioned that the climatic conditions under which the fuel was burned were exceedingly unfavourable to such a hygroscopic substance as coke. The extremely high percentage of moisture was found during periods when heavy rains fell and the average relative humidity varied between 80 and 85 per cent. Six per cent. would, however, appear to be the minimum amount of moisture gas coke is likely to contain, even in dry weather. With this amount of moisture, 1 ton of coke occupied 2.45 cubic metres as against 1.1 cubic metres in the case of the Welsh coal usually burned. In other words, 1 ton of coke occupied about 2.25 times more space than Welsh coal, and the extra work entailed was the cause of some complaint from the stokers.

The highest rate at which coke containing 6 per cent. of moisture was burned reached 18 lb. per sq. ft. of grate area per hour, but when the moisture rose to 20 per cent., as much as 23 lb. per sq. ft. of grate area had to be consumed in order to keep pace with the load.

A sketch is given herewith of the type of fire-bar employed (fig. 4). As the ash-pits contain water-troughs, no difficulty was experienced at all in keeping the fire-bars cool. The ash formed was exceedingly troublesome to remove, forming a layer some $1\frac{1}{2}$ in. thick over the fire-bars, that greatly hindered the passage of air through the fire.

In fig. 5 is given a CO₂ record that represents an average diagram. Frequent and careful tests made with an Orest set only served to confirm the high percentage of CO₂, and failed to detect the slightest trace of CO.

As it was possible to keep the amount of coke burned per sq. ft. of grate area per hour down to about 15 lb., except during the short peak load in the evenings, it was not considered necessary to go to the expense of fitting forced draught apparatus. All attempts to use coke in the automatic stokers ended in failure, owing to the burning of the bars and other parts of the stokers.

Extended trials made with coke breeze gave the following mediocre results, chiefly due to the extremely high percentage of ash that necessitated frequent supplementary cleaning of the fires by hand, on account of the impossibility of dealing, by means of the usual mechanical cleaning devices fitted, with this unusual quantity of incombustible material.

Lb. breeze per KW-hour	3196
Lb. steam per lb. breeze as fired	5319
Lb. steam per lb. of breeze from, and at, 212° F.	6282
Boiler efficiency, per cent.	55
Ash, per cent.	17
Moisture, per cent.	13

An analysis of the coke breeze is given below:—

ELEMENTARY ANALYSIS.		Sulphur ... 1.15 per cent.	
(Sample dried completely at 110° C.)		Volatile matter lost on heating away from air 2.60 "	
Carbon	83.1 per cent.	Calories per kilogram by	
Hydrogen	1.02 "	Mahler bomb	7,318
Ash	15.2 "	R.T.U.C. per lb.	13,170
Oxygen and nitrogen by differences	0.68 "		

100.00 per cent.

The endless difficulties experienced in attempting to obtain the efficient combustion of substances containing as much as 33 per cent. by weight of ash and moisture have not, as indeed might be expected, caused the authors' opinion of coke and coke breeze to be unprintable.

The few pleasant moments spent during the trials, even with the coke breeze, which on one occasion gave as high a boiler efficiency as 58 per cent., when things went well, were sufficient to show what excellent fuels both coke and coke breeze might be under happier conditions.

Spain.—La Sociedad Espanola de Industria Electricas is the name of a new undertaking which has lately been started in Madrid (Plaza de Carlos Cambronero), to carry on an electrical engineering business.

Fire.—On Friday morning last, damage to the tune of £2,000 was done by fire at the premises of the Yorkshire Cable Co., Ltd., Old Park Works, Bradford. The testing department and insulating shed were saved, and there will be no stoppage of work as temporary premises will be secured to replace those destroyed.

PRESSURE CURVES OF LARGE HIGH-TENSION NETWORKS.

It is now generally realised that, under suitable conditions, the distributed inductance and capacity of overhead lines may lead to serious pressure rise at the end remote from the charging station. Ordinarily, these phenomena are not apparent at commercial supply frequencies, but they may be set up by the higher harmonics of an impure pressure curve. Modern turbo-generators, with cylindrical rotor and distributed winding, give a practically pure pressure curve, which retains its sinusoidal character at all symmetrical loads; but, even so, quite impure curves may be obtained on long overhead lines fed from turbo-generators. Inductive loads reduce the tendency to such results, but capacity loads increase the tendency, and the use of transformers between generator and line also favours distortion of the pressure curve.

Small though the harmonics be in the pressure curve of a modern turbo-alternator, they are magnified by overhead lines and by step-up transformers feeding the latter. The impurities in the wave are more noticeable on the secondary than on the primary side of the transformers, and increase in amplitude, the greater the length of line to the observation point. As their amplitude increases, the harmonics are apt to cause disturbances on telephone lines, converter flash-over, and other troubles. From an analytical consideration of pressure and current distribution on an open line, it may be shown that the harmonics in the generator pressure

wave are not all magnified by an equal amount in the line. One harmonic is magnified more than the others, and which it is depends on the electrical constants of the line and on its length. The various waves are distributed (in space) along the line according to a cosine function. Full mathematical proof of this and subsequent statements, involving simple, but very cumbersome, equations, is to be found in a recent issue of the *E.T.Z.*, whence these notes are derived.

Suppose that a 50-cycle turbo-alternator is connected to a line which has (per 100 km.) an inductance of 0.15 henry, a capacity of 0.75 mfd, and a resistance of 20 ohms. Calculated curves plotted as above, show marked pressure-wave distortion, despite the purity of the generator wave. The latter is shown at A; and B, C, D, respectively, show the form of the pressure curve at the end of a 135-km., 215-km., and 300-km. line of the above characteristics. In cases B, C, and D respectively, the 11th, 7th and 5th harmonics are especially magnified. The conditions assumed may be considered somewhat exaggerated, but, on the other hand, the generator wave assumed is of exceptional purity and symmetry, and the resultant distortion depicted does give a fair idea of practical occurrences.

The effective resistance of an A.C. line increases as the frequency becomes higher. This effect is not pronounced for lower harmonics than the 11th in waves of commercial frequency (say, 50 cycles), but it prevents higher harmonics from resonating to any marked degree. It can be shown mathematically that an inductive load connected at the end of an overhead line tends to suppress resonance, and hence prevents individual harmonics from attaining excessive amplitude. On the other hand, a load of high capacity or leading power factor favours resonance of the higher harmonics in the generator wave to an extent dependent on the ratio of the load and line capacities. By combining capacity and inductance in series at the end of the line, to form an oscillating circuit tuned to any particular harmonic, the latter is almost entirely suppressed.

In almost every case in practice, overhead lines are fed through step-up transformers, and the precise effect of the latter as regards pressure distortion depends on their construction and characteristics, but by assuming the simplest possible type of transformer, and making perfectly general assumptions as to electrical characteristics, it is possible to demonstrate mathematically that, even on light load, large transformers may cause pronounced magnification of harmonics in the secondary pressure wave, the natural frequency of such transformers being sometimes as low as 500 cycles per second.

INDUSTRIAL RESEARCH IN THE U.S.A.

UNDER the auspices of the Council for the Organisation of British Engineering Industry a lecture on "Industrial Research" was given in the Manchester School of Technology on Tuesday, April 4th, by Mr. A. P. M. FLEMING, M.I.E.E. There was an attendance of about 300. The chair was taken by Mr. CHAS. DAY (Messrs. Mirreles, Bickerton & Day), who mentioned that at the works in which he was interested a small laboratory was provided in which new ideas were tried and developed before being finally adopted on engines supplied. The laboratory certainly cost something to run and maintain, but it paid for itself in many ways. He thought it a mistake to embody new ideas without first having given them a thorough trial, and he considered the last person to experiment on was a customer.

At the close of the lecture, a vote of thanks was accorded to Mr. Fleming, on the motion of Principal GARNETT, of the Manchester School of Technology, who gave an outline of the research work carried on in the School in conjunction with the Manchester Association of Engineers.

The following is an abstract of the lecture:—

An industry depends for progress on a continual influx of new knowledge, and it may be conceived that industrial research embraces all means whereby this new knowledge having application in industry can be obtained.

Industrial research in the United States is mainly accomplished by individual firms, although a good deal is done in the universities and national institutions.

As regards the work of individual firms, during the past ten years there have been very considerable sums spent by the leading manufacturing corporations to provide facilities for scientific investigation. Annual expenditures for this purpose of £25,000, £50,000, and even £100,000 are not uncommon.

Among the important features of the work of many of these private laboratories is the equipment of full-scale manufacturing plant, which enables discoveries in the laboratory to be fully tried out and manufacturing methods perfected, relieving the manufacturing departments from the hampering effects of new developments. Many of the laboratories also are equipped for the manufacture on a commercial scale of some of the commodities developed from their discoveries which are not of a character adapted to production in the manufacturing departments. The laboratory production in such cases is continued until it reaches such dimensions as justify the starting of a separate works. There is a growing tendency in many of the research laboratories to devote more and more attention to investigations in pure science having no immediate commercial object in view, with an appreciation of the fact that almost invariably such investigations result in some industrial application, sometimes resulting in the development of entirely new industries. Prominent examples of this kind are represented by the work of the General Electric Co.'s laboratory, at Schenectady, and the National Electric Lamp Association. In connection with such work, a very broad-minded policy is shown by the publication of the scientific investigations carried out.

It is also noteworthy that these research laboratories serve as very effective advertising means, by inspiring confidence in the minds of purchasers as a result of such visible evidence of scientific working.

There appears to be no doubt that these laboratories have proved financially successful, not only in that they afford the greatest possible assistance to the works with which they are connected in solving manufacturing troubles, developing new materials, methods, tools, and making discoveries which result in new industrial developments, but also in the direct manufacture and sale in many cases of valuable products straight from the laboratory.

A great deal of the research work of the universities is devoted to purely scientific investigations arising in connection with the preparation of degree theses by students, and from work done by the staff in their spare time. Apart from this, however, many investigations directed to the solution of particular manufacturing problems are carried out for private firms, and in a number of cases experiment stations have been arranged, the staffs of which devote all their time, or most of it, to research investigations.

In connection with Columbia University, it is proposed to erect a laboratory specifically devoted to research, the cost of which it is estimated will be of the order of £130,000 for buildings and equipment, and it is expected that an endowment fund, for extension and maintenance, of from £400,000 to £1,000,000 will be required. This proposal appears to be inspired to some extent by the success of the research laboratories associated with the large industrial corporations already referred to, and it is realised that there are many smaller manufacturers who are unable to support individually the burden of such laboratories, but who would be glad to avail themselves of the opportunities which this university research laboratory would afford.

An important feature of the proposal is the intention of devoting means to the collection of all possible information bearing on the industrial problems that are likely to be considered.

The most striking feature of the research work of the universities is this provision of research facilities and the use of a staff of highly-trained scientific men who can devote their

whole efforts to scientific investigation without the handicap of a great deal of teaching work as well as of financial anxiety. It is also noticeable that increasing numbers of young men who have taken their bachelor's degree proceed to a doctor's degree, possibly on account of the extended opportunities for employment now presented by the increasing number of research laboratories for men of the highest scientific training.

While there is as yet no national plan of industrial research, there are tendencies in that direction, some of which are directed to linking up the efforts of the universities, the extension of the experiment station scheme to a number of universities and colleges, and the co-ordination of the work of some of the existing laboratories connected with industrial concerns.

The work done in the United States is of considerable value to us in this country in enabling us to shape our own schemes with reference to research. The distinguishing feature of work done in America is that it is mainly in the hands of private companies, and is carried out in order than one company may more effectively compete with another. The development of the internal resources of the country has occupied most attention, and little work has been done with a view to encouraging export trade. In this country our export trade is of the first importance, and it is here that the country most feels the pinch of German competition. The opportunity, therefore, arises to take the greatest possible advantage of laxity in the past and, at the same time, to take steps to conserve our overseas trade.

This can only effectively be done by co-operating and pooling our scientific resources, which have hitherto lacked organisation. Doubtless each manufacturer will in future provide himself with a small laboratory where manufacturing difficulties peculiar to his own works can be solved, but the big advances in the future can only come by concentrating advanced research in a large central institution. The materials, tools, and processes which are common to any industry would be considered in such an institution and efforts devoted to improving them for the common benefit of the industry. Processes which are the monopoly of any individual firm would have to be left out of such a scheme. Differences of factory organisation and management and methods of distribution would still enable manufacturers to compete amongst themselves, but the whole industry would be lifted to a higher plane through discoveries arising from work done at a research institution, which would enable foreign competition to be met most successfully.

Such an institution would comprise a laboratory for each of the great industries housed in a large central building. Much of the work done would be along lines of pure science investigation so as to ensure priority of new applications in industry. Patents would be taken out on behalf of the Government, and manufacturers in this country or the colonies would be licensed to manufacture at a nominal charge. Work would be done without the overlapping which inevitably occurs among a number of different institutions, and which results in great lack of economy, and administrative expenses would be kept to a minimum.

The above scheme presents advantages over any proposal to distribute the research work among the universities.

English people seem to possess a certain industrial genius which assured them priority in the industrial world in the past, and the records of our inventors and discoverers lead to the belief that what has happened in the past may with suitable organisation be repeated in the future.

RÖNTGEN SOCIETY.

At the meeting of the Röntgen Society, on April 14th, Mr. B. H. MORPHY and Mr. S. R. MULLARD read a paper on the subject of the enclosed tungsten arc as a source of ultra-violet light. They have adapted the new "Pointolite" lamp of the Ediswan laboratories to a therapeutic purpose by enclosing it in a quartz bulb, so that the ultra-violet output is very largely increased. The open tungsten arc had a spectrum which extended further into the shorter wave lengths than did the enclosed arc, but even if these very short wave lengths were of therapeutic value, the authors contended that the sputtering of the open arc and its constant need of attention militated against its value in hospital work. The enclosed arc gave off a large quantity of ozone, owing to the ultra-violet radiation, thereby showing that its value in this direction must be considerable. If the lamp was over-run, the rays obtained extended much further into the ultra-violet, but this practice, of course, diminished the life of the lamp.

Major WILSON, of the Canadian Medical Service, said that ultra-violet light was proving of great use in the treatment of wounds at the base hospitals, and the French were using it extensively. He had himself made some experiments with a view to obtaining ultra-violet light of much shorter wave-length than hitherto by striking an arc in tungsten vapour, or using a tungsten base as one electrode, and a carbon as the other.

Mr. E. SCHALL, B.Sc., read a paper on some experiments he had been conducting with a Coolidge tube. He said that he thought it possible that X-rays might be discovered having a quality so "hard" as to be capable of passing through sub-

stances, whether photographic emulsions or the tissues of the human body, while producing a very small effect indeed. He believed that the explanation of some curious phenomena he had observed in the case of the Coolidge tube was that the radiation from this tube was heterogeneous, and that the more current that was passed through it, the greater was the proportion of exceedingly hard radiation which could not be detected, and which approximated to the gamma radiation of radium in hardness.

Mr. P. J. NEATE, one of the Governors of the Cancer Hospital, demonstrated a chronograph which he had constructed to work with the electroscope, in response to a suggestion by the hospital physicist that a chronograph substitute for measuring the duration of the electroscope readings would be very useful. The prime mover was a rotating gramophone cylinder, and by means of opposing magnets, armatures were oscillated in such a manner that a pen in connection with them was made to record a line of jerks corresponding to brief intervals of time.

At the same meeting the Society passed a resolution expressing concern at the present conditions of X-ray examination in naval and military hospitals, in view of the number of installations, some of which were believed to be defective in their means of protection, in the hands of inexperienced X-ray workers. The suggestion was made to the authorities that every installation, both at home and abroad, should be inspected by experienced radiologists.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The Engineer, in the Tropics.

I have to thank "Koie-Hai" in your issue of March 31st for his criticism of my article of March 17th.

His severe strictures upon my suggestion that corrosive sublimate should be carried seem to be the result of a misapprehension on his part. I thought I was quite clear in stating that corrosive sublimate was a *first-aid* remedy. It is not intended for a regular dressing.

During the time I spent up the Amazon River I was responsible for about 500 men; amongst such a number, accidents were of daily occurrence. When a man was brought into the First-Aid Station his wounds were completely washed out with a 5 per cent. solution of corrosive sublimate, thereby rendering the wounds completely aseptic, after which the usual dressings were applied.

Hundreds of cases were treated by this method, and, so far as I can recollect, we never had a case of septic poison in any wound so treated.

In view of this experience, I am still convinced that corrosive sublimate should be carried amongst the *first-aid* remedies in a tropical country.

Geo. R. Archdeacon.

Blackpool, April 4th, 1916.

Australia and the Metric System.

In my country, Australia, we have on our Statute Book a law which only requires a Royal Proclamation to banish all weights and measures outside of the metric. We have held our hands till now, because we feared to damage the trade which we bring to the Mother Country. If we despaired of your adopting the metric system, we should put our law into operation, for we cannot wait for ever. In the near future, we hope to see every young man studying science and, necessarily, learning and using the metric system. Shall we, in deference to your inertia, condemn those young men to learn, in addition, every remnant inherited from bygone attempts to establish a perfect system of weights and measures? Let us give credit to the more mathematical ancients for trying homogeneous systems, such as the Chaldean, with a basis of 60; but why take thence our time and angle divisions, from another our binary divisions of the gallon and the inch, from elsewhere a duodecimal division of the shilling, and of one breed of ounces?

One cannot help feeling that the greatest enemy of progress is the one who, like "Cantuck," has had a scientific training and advocates metric reform, but points with trembling finger to the dangers lurking in every change. Even the misfit of the ounce with the Canadian cent worries him, although it would (at 16 to the lb.) fit no better with the 12 pennies in the shilling.

Edward C. Barton,
Secretary, Queensland Decimal Association.

London, S.W., April 10th, 1916.

[We hope the Commonwealth will continue to exercise pressure upon the Imperial Government, with a view to hastening the advent of the reform which is so long overdue.—Eds. *ELEC. REV.*]

Cause of Flicker.

There seems little doubt that bad valve setting is the cause of flicker in many cases of relatively small steam direct-driven sets.

I am familiar with the very small sets which, placed beside the driver on his seat, provide the electric lighting on the steam omnibuses of the National Steam Car Co., running on the London streets.

It was the practice in setting the valves of these little engines to adjust till flicker disappeared, and the method was found simple and satisfactory, being much simpler than setting to measurements.

Charles H. Wright.

Glasgow, April 4th, 1916.

I have been interested in the correspondence on the above subject, as a very remarkable case of lights flickering came under my notice some years ago. The firm I was with supplied a generating set to a central station for town lighting, the set being the largest in the station at that time, and consisting of a high-speed steam engine direct coupled to two direct-current generators in line, one generator being connected across the middle and one outer, and the other across the middle and the other outer. The set thus formed a balancing generator set. Whenever this set was put on the bus-bars the lights flickered all over the town, which was of fair size. Although having previously had nothing to do with the design or manufacture of the set, I was eventually sent down to endeavour to locate the trouble. I went very carefully into the whole matter, and found that every part of the shaft and armature ran perfectly true, and all electrical details appeared to be quite all right on both machines. Now, there was a bearing between the two generators, and, of course, another bearing on the end spindle of the generator remote from the engine; there was a coupling between the two generator armatures, a spare armature had to be supplied, and all armatures had to be interchangeable. Thus, the outer bearing and the bearing between the two machines had to be the same size. Unfortunately, both bearings were made to the standard of the outer bearing for that size of armature. After my tests, I came to the conclusion that the journal of the shaft in the bearing between the two machines was too small in diameter, and was causing a whip. As this meant three new shafts, two new bearings, and altogether an expense of some hundreds of pounds, it was not accepted at once. However, eventually the alteration was carried out, and no further trouble was experienced. Thus, I would suggest that your correspondent should see if his shaft is not small somewhere between his engine and his generator armature.

Richard C. Dieppe.

London, S.E., April 7th, 1916.

The Council of the I.E.E.

I am pleased to see that your journal has taken exception to the nominations of what is, to all intents, a self-elected Council of the Institution, and rightly, when one considers that the country is passing through the most critical period in its history, and as far as the electrical industry is concerned, a crisis which, if not faced now, will mean after the war that English electrical houses will have to face competition seriously handicapped by the inroads which war has made. At such a time it is necessary that the Council of the Institution should have included on its men of *strong British* sentiments, whose one intention should be *Britain* for the *British* and a closed door to the enemy, with all his wares and hidden interests. It may be said that the Council of the Institution is not concerned with the commercial future of the electrical industry any more than it was in respect of excluding members of alien enemy origin, but it has been by popular demands very reluctantly forced to take steps towards dealing with such members, and there is no reason but to believe that equally dilatory action would be taken in regard to English commercial interests. It, therefore, behoves all members to see that this election is not as in previous years, but that other members are nominated against the Council's nominations and every endeavour made to elect them.

P. M. A.

WAR ITEMS.

Sports Outfits Wanted for the Front.—We have had a call from Corporal Watts, whose letter on "Wireless Wiring at the Front" appeared in our issue of March 3rd, page 271. He asks us to appeal to any of our readers who may not be using their sports outfits, or parts thereof, this year to send them to the Mechanical Transport Section at the Front. Cricket bats, stumps, and anything suitable for outdoor sport will be most welcome to aid in whiling away the half-holidays while waiting for the Huns. They should be addressed thus: Corpl. A. E. Watts, 5th A.S.P., B.E.F.

Glasgow and Enemy Aliens.—The "Times" says that a petition has been extensively signed in Glasgow calling on the Lord Provost to convene a meeting to consider the whole question of alien enemies being allowed to reside and trade in the city and whether alien professors and teachers should be allowed to occupy positions of profit.

Exemption Applications.—At Ilkley the engineer of the Ilkley Electricity Works (Mr. Sidney Bell) applied for a month's postponement in respect of his switchboard attendant. He said that the attendant was really engaged in a reserved occupation and would have been in order in applying for total exemption, but he only desired a month's postponement. The application was granted.

At Burnley Tribunal, last week, an electrician made application for his motor repairer and armature winder. The Mayor: It will be easy to have this work sent away?—Not at present. We are doing work for firms doing Government work.—Not assented to.

At Berwick-on-Tweed, on April 5th, the local electric light company appealed for Mr. R. Hamilton, accountant, of Tweedmouth, whose services were deemed indispensable. It was stated that he had been with the company for 16 years, and it was claimed that he would be of more use to the country if he was allowed to remain. Capt. Nicholls (Military representative): He receives two months' clear notice before joining. He comes under the group known as "Britain's last hope," and he is kept at work till everybody is called up. Six months' exemption was allowed on condition that he remains in his present employment.

At Southend-on-Sea, on April 3rd, exemption until June 1st was allowed Mr. W. C. Smith, chief electrical engineer to the Kursaal Estates, Ltd.

At Guildford, Sergt.-Major E. J. Nunn, electrical engineer, who is in the 5th Queen's Regiment, appealed for Mr. C. G. Howard, works manager, and Mr. H. O'Connor, electrician. He said that seven employees had enlisted, leaving only the two applied for. If the request was refused he would have to take his own discharge at the end of the month in order to look after the business. On Mr. Nunn undertaking to re-engage for general service, Mr. Howard was granted absolute exemption, and Mr. O'Connor was given three months, with leave to appeal again.

At Walton-on-Thames, Mr. Scott, electrical engineer with Mr. W. H. Davies, of Cobham, was granted two months' exemption on the recommendation of the military representative.

Mr. S. Terry, electrical engineer, Canterbury, appealed to the tribunal, on April 3rd, for exemption on the ground that he was at present best serving the national interests. He said it had taken him eight years to build up the business, and he was carrying out important electrical work in connection with two local munition works. If he was called up the business would have to be closed. He was allowed three months.

Dudley tribunal has granted two months' exemption to an electrical engineer responsible for the maintenance and repair of electrical plants at six works, all engaged on Government work.

Clacton-on-Sea tribunal has granted conditional exemption, acquiesced in by the military representative, to the electrical engineer of the U.D.C.

Before the Surrey County Appeal Court, Mr. J. H. Batchelor, accountant to Edmundson's Electricity Corporation, of Dorking, appealed against the decision of the local tribunal refusing exemption, but the appeal was dismissed.

The Rochdale Tribunal last week granted conditional exemption to Harry Spry, an electric wireman employed by Mr. G. L. Adamson.

At Hurst (Lanes.), an appeal under the Military Service Act was heard, the appellant, J. H. Brownson (20), electrical fitter, stating that he had tried to join the Colours, on three occasions, but had been refused because he was wearing a munitions badge. He had this badge on when he appeared before the Tribunal, and the latter decided that he was exempt, and need not have appealed.

Middleton Tribunal granted conditional exemption to a pavior and platelayer employed by the Middleton Electric Traction Co., and appealed for by them on the ground that he was solely engaged in the maintenance of tramway track and was "reserved."

At Salford, last week, an electric wireman engaged on installations at controlled factories received exemption until June 7th, and he told the Tribunal that if the country was badly placed he would be in the Army by then.—Also at Salford, an electrical engineer appealed for exemption and stated that his firm were engaged on making fittings for sea mines. The members of the firm had invested all their savings in the business and in getting the machinery together. Exemption was granted conditional on his continuing in his present employment.

Exemption to the end of May was granted at Warrington to an electrician at a local theatre.

At Stretford a foreman electrician employed by a local engineering firm stated that he had been passed for home service, but he had stiff hands. The appeal was disallowed.

At the Lincoln Tribunal application was made for an electrician who is working at a flour mill. He was only 23 years of age, however, and the chairman said he could not think the man was indispensable.—Claim disallowed.

At the Oxford Tribunal, the City of Oxford Electric Tramway Co. applied for absolute exemption for its chief engineer, electrician, a fitter's mate and a unit adjuster, and a number of motor bus drivers, on the grounds that their present employment was in the national interests, and that the men were in a certified occupation. The Court granted

conditional exemption for the four cases named, theirs being certified occupations, but the 13 other cases were adjourned for two months.

Before the Berks Appeal Court, on April 4th, the Military appealed against six months' exemption allowed by the local tribunal to six employees at the Maidenhead Corporation Electricity Works. The exemption was reduced until June 1st, with leave to renew the appeal.

At Old Hill, a Brierley Hill firm of electrical engineers applied for exemption for an electrical engineer on their staff. For the firm it was stated that they were employed at several munition works, and if the man appealed for went they could not assist these works in case of breakdown. The tribunal granted a month for the firm to get the appellant badged.

At Farnham, on April 4th, Mr. H. J. Reed, electrical engineer, in charge of the mains of the Farnham Electricity Co., applied for exemption. He said that he was in partnership with Mr. Kimber, and they were under contract to repair, lay, and renew the mains of the company, and had been asked to do similar work for the Farnborough Electrical Works. Three months were allowed, with leave to appeal again.

Mr. W. Jackson, chief assistant engineer at the Llandudno Electricity Works, has been exempted so long as he remains in his present employment.

French Works in Enemy Occupation.—A year ago it was impossible for the Société d'Electricité et Gaz du Nord to submit full accounts for the year ended with June, 1914, owing to the company's electricity and gas works being situated in the districts invaded by the enemy and the inability to obtain the figures for the final three months of the financial year. The same state of affairs still prevails for that year and also for the succeeding twelve months. Nevertheless the directors have endeavoured to secure information relating to the condition of the works during the period of enemy occupation, but it has not been possible to correspond advantageously with those members of the staff who remained in the invaded territory. Information derived from Government sources, however, shows that the works and installations have not suffered serious damage since the non-military personnel is engaged on the supply of current to consumers under the control of the Germans. The conditions under which the supply of coal and other materials is effected, as well as the regulations in regard to the collection of accounts, are quite unknown to the company. The situation in respect of the interest possessed in the Société de Gaz et d'Electricité du Hainaut, Belgium, and the Société d'Electricité, of the district of Valenciennes-Anzin, has also undergone no change. These companies are circumstanced similarly to the Electricité et Gaz du Nord, as the war has interrupted normal working, but there is reason for assuming that the German occupation has not stopped the operation of the works.

The Supply of Tramway Rails.—In the March issue of the "Journal" of the Tramways and Light Railways Association it is stated that negotiations are taking place between the special committee of the Association and the rail manufacturers with a view to securing a supply of rails during the next twelve months. "Members have been asked to supply the secretary with the minimum quantity of rails and fishplates required by them for repairs which are absolutely necessary for keeping their undertakings going. The manufacturers have now been asked to quote prices at which they would be able to deliver these, and members will in due course be advised thereof. It will then be necessary to apply to the Minister of Munitions for permission to roll these rails, and to grant facilities for their delivery to the various tramways requiring them." It is hoped that a satisfactory result may be obtained." According to the arrangement made with the manufacturers last November, the price of steel tires for the quarter ending July next will be the same as for the past quarter.

Warsaw Telephones.—With the occupation of Warsaw by the Germans, the authorities forbade private persons to use the telephone system. An exception was made in favour only of members of the Citizens' Committee and magistrates. But considerable losses resulted from this order, not only to the Polish citizens, but to the private companies of neutral powers operating in Warsaw. Amongst those that suffered considerably may be mentioned the Swedish Sederger Company, the director of which is the Swedish Consul. This company applied to the authorities to have the prohibition removed. The result of this application was, says the "Gazeta Polska," that the authorities authorised the use of telephone lines to stores, trading and commercial firms, and to a small number of reliable people. The remaining subscribers had to continue without the use of the telephones, which had to be retained in the control of the military authorities.

To be Wound Up.—Orders have been made by the Board of Trade requiring a number of other companies to be wound up (the total is now 100), including the following:—Berkefeld Filter Co., Ltd., 121, Oxford Street, London, W., filter and pump manufacturers; controller, G. M. Robinson, 3, Raymond Buildings, Gray's Inn, London, W.C. Maschinenfabrik Augsburg-Nürnberg A.G., Caxton House, S.W., manufacturers of gas engines, &c.; controller, B. E. Mayhew, Alderman's House, London, E.C.

French Economic Expansion.—The Paris correspondent of the "Daily Telegraph" states that a Commission was appointed recently by the National Association for Economic Expansion to examine the question of cartels and commercial "ententes." This body was composed of well-known politicians, economists, manufacturers, merchants, and agriculturists. The other day the chairman of the first meeting of the Commission, M. Guisthau, formerly Minister of Commerce, pointed out the difficult position in which French manufacturers are placed in respect of foreign competition by existing legislation, notably a clause of the penal code, which places French manufacturers at great disadvantage by depriving them of facilities enjoyed by foreign competitors in the liberty of making "ententes." The Commission is divided into two sections, economic and judicial, and these sections are now studying the question with a view to making considered proposals to be submitted to Parliament.

The Petrograd Lighting Co. of 1886.—A communication reported to have been forwarded by the Russian Prime Minister to the Moscow City Council states that the question of the liquidation of the Petrograd Electric Lighting Co. of 1886 is not yet ripe for discussion. The chairman of the company, Lieut.-General Svontorschitzky, is of the same opinion. During the war the company has merely remitted 166,409 roubles abroad, exclusively to allied and neutral countries, of which 53,000 roubles refer to England. The dividend declared for 1914 has not been paid. The assets of the company amount to about 60,000,000 roubles. If the Moscow City Council desire to take over the company's local works, the town must first ascertain whether it has now at disposal the necessary capital of 2,800,000 roubles.

St. Helens Corporation and its Contracts.—Considerable discussion took place at a meeting of the St. Helens T.C. on April 5th respecting the position of a firm manufacturing accumulators, from whom it was proposed to purchase plates. It was stated that the works were "controlled," and that contracts were being executed for the Government. A member of the Council objected to the firm having the order until the Electricity Committee had definitely ascertained that no British firm could deal with it. Sir Joseph Beecham said the committee had already ascertained this, and if the present offer was not accepted they would have to pay £600 extra. The Council rejected a proposal to refer the minute back to the committee.

Manchester Corporation Contracts.—At the meeting of the Manchester City Council on April 5th attention was called by Mr. McLachlan to tenders which the Tramways Committee had accepted for certain electric lamps, and it was asked whether the standing orders were complied with requiring that two-thirds of the capital of the companies tendering must be British controlled. He submitted that parts of the lamps in the tenders were monopolised by an article with a German influence, and he pleaded for fair play for the British manufacturer. Alderman Bowes assured the members that so far as they were aware the firms whose tenders had been accepted were British. If there was any doubt about it he would take back the minute. It was resolved that the minute relating to the tenders be referred back.

Lighting Prosecutions.—In a prosecution at Bolton, on April 6th, under the Lighting Order, one of the magistrates said he had every sympathy with the defendant because the Corporation should apply the law to itself before proceeding against ratepayers. The tramcars were setting a bad example in regard to lights, and these should be dealt with before the law was applied to citizens.

At Bury County Police Court on April 6th, the Lancashire E.P. Co., of Ainsworth, were summoned for a breach of the place restriction regulations. It was stated that the place complained of was a sub-station. A fine of 20s. was imposed.

Air-Raid Fatality.—At an inquest in a North-East Coast town upon the body of a local electrician it was stated that he had escorted a young lady home and was returning when the Zeppelin bombardment commenced. He was blown through a plate-glass window, and was found in the shop some hours later by a policeman. He was terribly injured and succumbed in the Infirmary. The jury returned a verdict of death from peritonitis, set up by injuries sustained through the explosion of a bomb thrown from a hostile air-ship.

Trading with the Enemy.—The "London Gazette" for April 7th contains additional lists of persons or bodies of persons with whom dealings are prohibited, in the Netherlands, Netherland, East Indies, Portuguese East Africa, Morocco and Portuguese East Africa; also some amendments to earlier lists.

Not for War Service.—The Ministry of Munitions has declined to allow Dick, Kerr and Co., Ltd., to deliver to the Reading Town Council six motors for tramcars, on the ground that the motors are not needed for cars used exclusively for carrying munition workers. The cars were ordered last August.

Exports to China.—The "London Gazette" for April 11th contains a further list of persons and bodies of persons to whom articles to be exported to China may be assigned.

Municipal Corporations and Enemy Firms.—Other municipal bodies which have decided to give support to the action of the Manchester Corporation in adopting standing orders prohibiting trading with persons or firms of Austrian or German nationality or composition, include Crewe and Southport. The Nelson Corporation has decided to leave the matter alone. The Bury Town Council, after a lengthy discussion on April 6th, decided to take a similar course, an amendment that they should support the Manchester resolution being defeated by 17 votes to 15, two members of the Council remaining neutral.

NEW ELECTRICAL DEVICES, FITTINGS, AND PLANT.

Simplex Lanters.

We illustrate herewith two of the latest patterns of Simplex fittings for industrial lighting with "half-watt" lamps. In these designs the aesthetic as well as the utilitarian aspects of the question have been studied, the glassware has been specially chosen, and provision has been made for using lamps of a wide range of wattage.

FIG. 1.—SIMPLEX SEMI-INDIRECT FITTING.

Fig. 1 shows a fitting for semi-indirect lighting, 20 in. in diameter x 30 in. high, for lighting large areas such as public halls, railway stations, &c., with lamps up to 1,000 watts.

FIG. 2.—SIMPLEX CONCENTRATING REFLECTOR.

Fig. 2 shows a reflector for workshop and office lighting, taking ordinary tungsten lamps up to 60 watts, and half-watt lamps up to 100 watts. A variety of other designs is available, including a number of anti-Zeppelin reflectors.

Safety Device for Electric Motor Vehicles.

Particular interest attaches to a safety device for electric motor vehicles, which has recently been worked out in the mechanical engineering department of the Eastman Kodak Co., the well-known photographic apparatus concern, of Rochester, N.Y., U.S.A., in that no patent has been taken out for it, the designers having commendably decided not only to make it known as widely as possible, but to couple with any publicity regarding it, the announcement that any user or builder of electric motor vehicles is at liberty to adopt the idea.

Like many other concerns in the United States, the Kodak Co. is a large user of electric delivery vehicles; it has also, in the interests of its many employees, a Department of Safety and Welfare, of which Mr. H. E. Akery is the engineer. It has been found that despite the care exercised by trained drivers, it occasionally happens that when the vehicles are stopped by switching off the current, the speed control lever is not always at the same time brought back to the neutral position, with the result that, overlooking this fact, the car bounds away unexpectedly when the current is again switched on, with the risk of causing both physical injury and material damage, and even giving rise to fatal accident. It was occasional experiences of this kind that led the Department of Safety and Welfare to introduce on all the Kodak Co.'s fleet of electromobiles the safety device illus-

Northfield, Birmingham, have constructed in large numbers for supplying current for X ray apparatus in travelling operating theatres while this week we are able to illustrate a plant they have recently designed for the special purpose of generating current for electric lighting and power purposes for field workshops.

The set consists of one of the standard-type Austin engines, with four separate cylinders coupled direct to an 18-KW. generator. The engine, which is provided with a governor in order to secure a constant speed, is fitted with magneto ignition, and is adapted to work with either petrol or paraffin; the former is used on starting up, and paraffin when the engine becomes warm, the heat of the exhaust manifold being utilised by means of a "muff" in conjunction with the gas admission pipe, to assist in the vaporization

FIG. 3.—CONTROLLER IN NEUTRAL AND CURRENT SWITCH IN OFF POSITION.

FIG. 4.—CONTROLLER IN A SPEED POSITION; CURRENT SWITCH BLOCKED.

FIG. 5.—SWITCH PROPERLY CLOSED; CONTROLLER MOVED INTO SPEED POSITION.

trated herewith, and by means of which it has been rendered impossible for a driver to close the main switch when the controller is off the neutral position.

Figs. 3, 4 and 5 show, in different positions, one of the devices mounted in a box similar to a driver's seat in the rough, the photographs being taken from the front. The driver sits at the left side of the box—that is, at the right of the picture—and operates the controller B, with his left hand. The rheostat selector shaft A, to which the controller B is attached, also carries

of the heavy oil. An interesting feature of the plant is the method of cooling the cylinders; in place of the large tank of water usually employed for this purpose in stationary engines, an ordinary motor-car type radiator is employed, this being mounted on a separate bedplate and fitted with an enclosed fan driven by a small electric motor in order to maintain a strong current of cool air through the tubes of the radiator; flexible armoured hose is used to conduct the water from the engine cylinder to the radiator and *vice versa*, the circulation being assisted by means of a small

FIG. 6.—AUSTIN FIELD-WORKSHOP ELECTRIC GENERATING PLANT.

a secto. c, which prevents the main switch being closed except when the controller and all the selectors are at the neutral point. The switch handle, which is connected with a lever D, is also provided with a pawl E, which, to fully close the switch, must first pass through the slot in the sector. Should the controller be in any other position than neutral, the pawl and slot no longer coincide, so preventing the switch being closed. The arrangement does not prevent the current from being switched off at any position, as, the pawl being held forward by a pressure spring, the switch lever can be dropped at any moment, and independently of the controller.

The arrangement, which is quite simple and inexpensive, should be the means of preventing many an accident, especially having regard to the fact, mentioned above, that it can be freely adopted by any user or maker of electric motor vehicles.

Austin Field-Workshop Electric Generating Plant.

In a recent issue we briefly described the compact little electricity generating set which the AUSTIN MOTOR CO., LTD., of

pump. As will be seen in fig. 6, the set practically comprises four units—the engine and dynamo, the radiator and fan, and the paraffin and petrol tanks, the latter being mounted on stands in order to give the necessary flow of the liquid fuel to the carburettor, an arrangement which enables the plant to be quickly set up in any desired position.

Rochdale.—Having regard to the abnormal conditions of working and the rapid increase of the requirements of existing consumers, the Electricity Committee has decided that it cannot recommend the connection of any further large consumers at present. Mr. S. L. Pearce is to report upon the provision at the existing works to meet the increasing demand for energy, and to advise as to the charges for the supply of electricity for power purposes.

LEGAL

KRUPP'S PATENTS FOR MAGNETIC SEPARATORS.

In the Patents Court, on Friday last, before the Controller, Mr. Temple Franks, and the Deputy Controller, Sir Cornelius Dalton, the Rapid Magnetising Machine Co., Ltd., applied for a licence to use three of Krupp's patents for a magnetic separator for treating ores. The patents are Nos. 14,082, of 1908, and 29,230, of 1911, in the name of Georg Ullrich, and 4,595, of 1913, in the name of the Fried. Krupp Aktiengesellschaft Grusonwerk.

The patents cover a device for extracting from amid the material in which it is found wolfram, the ore from which tungsten is derived. Wolfram is mined largely in the Cornish mines in combination with tin, and was at one time regarded merely as an impurity presenting considerable trouble to tin smelters. The material being feebly magnetic is susceptible of high intensity magnetic treatment through an apparatus to which the patents apply.

Mr. Hunter Gray appeared for the applicants; Sir George Croydon Marks, M.P., for Messrs. Edgar Allen & Co., Sheffield, who opposed the application, and Mr. Rusben, of the firm of Messrs. Haseltine, Lake & Co., for the patentees.

MR. HUNTER GRAY said he enquired Messrs. Edgar Allen & Co. also proposed applying for these patents.

SIR GEORGE intimated that he intended applying for a dozen patents in connection with this machine at a future date, and he did not know how the Rapid Magnetising Machine Co. thought they could get on with only three. They were already manufacturing to the order of the Government.

MR. GRAY went on to say that the applicants were incorporated in 1903, a British company with British capital, and were the only firm in the British Empire that specialised in magnetic separators. The principle of the machine applied for was that of a number of magnet poles placed in a ring over which rotated a disk-shaped magnetisable body. The electromagnets below, with attached pole-pieces, were excited by coils, and a rotating shaft, to which the upper ring or disk shaped armature was attached, ran through the centre of the circular iron body which carried the magnets. Between the magnets and the armature rotating above them, the material, from which the metal was to be drawn, was fed in from a hopper. Round the under side of the revolving piece went concentric magnetisable, axially-adjustable rings, wedge-shaped below, at graduated distances from the magnets. The outermost ring-edge was the furthest away from the horizontal pole surfaces, and therefore produced the weakest zone in the magnetic field. This attracted particles of the highest permeability, whereas the inner ring-edge was nearest the pole surfaces, produced the strongest zone, and consequently attracted substances of lower permeability. Thus the material was graded. Midway between the magnets, the attracted particles fell off the rings; the place of minimum magnetic intensity having been reached, and were carried away in different directions in their separated and graded form.

In the 1911 patent the armature-rings, as they were called, were fixed and the field below was fixed, and there was a curious zig-zag-shaped trough running from the centre, through which the ore travelled. It was this trough now that revolved. The result was that the ore did not "stick," but it was carried away equally in graded sizes. It was an adjustment of the same principle and an improvement, and it was called the dry treatment. There was a further modification, known as the wet treatment, where water was played upon the points of the wedge-shaped rings, to drive off the ore as it got out of the field.

SIR GEORGE: Mr. Thompson, who will give evidence directly, has written a letter, which has appeared in the technical journals, casting doubt on the special value of this machine; why, then, does he come here and ask you to give him a licence to make it?

MR. GRAY: Because the public want it—misguidedly and foolishly they want it—and his firm have more experience than any other for making and selling it. They suggest the usual royalty of 5 per cent. on the selling price, and will give an undertaking that the price at which they sell shall be, at most, not more than the price charged by the patentees before the war.

MR. H. HUBAND THOMPSON, the applicants' managing director, giving evidence, said magnetic separators had been the exclusive business of the Rapid Magnetising Machine Co., Ltd. Sir George Marks was wrong if he suggested that he ridiculed the German machine.

SIR GEORGE MARKS: If Messrs. Edgar Allen & Co. may have a licence for a 5 per cent. royalty, too, that will simplify matters considerably. We are prepared to develop the sale.

THE CONTROLLER said that as far as he was concerned both applicant firms should have a licence.

MR. THOMPSON said that it was an extraordinary thing that the Government had not a British magnetic separator at the Imperial College of Science at South Kensington.

THE CONTROLLER: The old story one hears here from time to time—no trouble taken by the British manufacturers to push their inventions.

MR. RUSHEN, on behalf of the patentees, desired an adjournment to bring into the Court Mr. Walter Sally, whose wife's daughter was the inventor Ullrich's wife, to say he had practically concluded arrangements, when the war broke out, for erecting a manufactory for the supply of these machines in this country. He was to have paid a royalty of 30 per cent.

THE CONTROLLER said he thought the application satisfactory. The only question was the royalty, and he should hear more about that next week. In the public interest he thought it advisable that the machines should be made in this country, and clients'

letters which he had seen showed the estimation in which it was held. The applicants desired to say: "We can supply an efficient British designed machine, but if any customer is unpatriotic enough to require another type we can give him it." Their position was quite intelligible. The machine must be made in this country to meet the demands, and that being the position, he thought the Rapid Magnetising Machine Co., Ltd., should have their licence.

MUNITIONS APPEAL CASE.

In the King's Bench Division, on April 7th, Mr. Justice Atkin heard an appeal by a firm of mica and insulator makers from the decision of a Munitions Tribunal that they were not an engineering firm within the meaning of the Munitions of War Act, and therefore it was unnecessary for an employer to have a certificate on leaving their employ.

MR. ALEX. NIELSON, appearing on behalf of the appellants, said that they were the makers of insulators and insulating materials for dynamos, &c., and much of their work was for Government contracts. During the last day or two workers in that trade had been put in the exempted list, and skilled men in the Army had been fetched back. The appellants' works were the only works of any substance to make mica in this country, and he argued that this brought them under the definition of munition works.

MR. COMYNS CARR appeared for the Ministry of Munitions. Evidence was called.

In his judgment, his Lordship said the finding of the Tribunal was that the appellants' business did not consist wholly or mainly of engineering, and therefore a leaving certificate was not necessary. But the appellants had tendered evidence to indicate that their business was of a wide and different kind, and he was satisfied from that that they were engaged exclusively in making by means of machinery, articles which were the necessary parts of dynamos and other machines which were used for war purposes and for the production of power. Under those circumstances the question arose whether it was right or wrong to find that they were not engaged in engineering. The meaning of the word "engineering" had to be read in connection with the definition of munitions works in the Act. That definition applied to a factory or workshop engaged in manufacturing arms, and explosives, the repair of arms, naval and military buildings, and the supply of light, heat, water and power to such buildings. Having regard to this he came to the conclusion that the finding of the Tribunal was incorrect, and that their decision must be set aside. The appeal was brought purely for the purpose of obtaining a decision as to their actual position, and was, therefore, a test case.

COAL MINES ACT: PROSECUTION.

AT Merthyr, last Friday, the hearing was resumed of the summonses against Mr. W. W. Green, agent, and Mr. H. Thomas, manager, of H.D.'s Plymouth Co.'s Collieries, for offences under the Coal Mines Regulation Act, namely, failing to keep the plant in proper condition. After evidence had been heard respecting a length of bare cable, Mr. Vachell, for the Home Office, dealt with the charges of failing to earth a switch, instrument cover, and lampholder. He said that they were simply types of a number of offences of a similar character. Mr. H. Thomas, the manager, said he was under the impression all the parts mentioned had been earthed. It was the electrician's work to see that the earthing was done. He did not think Mr. W. J. Charlton, one of the inspectors, pointed out 170 unearthed pieces of apparatus, though he might have pointed out 90 unearthed lampholders.

According to the *Western Mail*, the next summons was that "the switchgear and all terminals, cable ends, cable joints, and connections of apparatus, had not been constructed and installed so that all live parts should be so protected or enclosed as to prevent accidental contact by persons and danger from arcs or short circuits, fire, or water."

Evidence was given by Mr. Charlton that there was a place in the colliery where there was no switch, and also no automatic means for cutting off the electrical pressure. At this place there were five lamps, and Rees Thomas, electrician, who was called for the defence, said these were only temporary lights, and the matter had been overlooked.

Giving evidence in support of the summons, "Cables not protected by metallic covering where pressure exceeds low pressure," Mr. Charlton said that at the No. 2 Pit he found a space of 4½ ft. where there was no metallic protection for the cable, and evidence was also given in support of the summons that unarmoured cables were not hung on proper insulators.

The hearing was adjourned.

Patents and Alien Enemies.—Application has been made to the Board of Trade by Messrs. Edgar Allen & Co., Ltd., Sheffield, for the avoidance or suspension of Patents No. 14,082/08, granted to Ullrich; and Nos. 17,459/09, 29,201/11, 29,224/11, 29,230/11, 4,595/13, 14,426/-3, 14,427/13, and 24,355/13, granted to Fried. Krupp, A.G. Grusonwerk.

Japanese Electric Wire Exports.—One result of the war is seen in the development of the Japanese export trade in insulated electric wire; a return was recently issued showing that the shipments from that country during the 11 months ending with November last attained a value of £80,500, as compared with only £31,600 in the corresponding period of 1914.

BUSINESS NOTES.

Catalogues and Lists.—**MESSRS. SIMPLEX CONDUITS, LTD.**, Garrison Lane, Birmingham.—Sixteen-page pamphlet containing illustrated particulars and prices of lanterns and reflectors suitable for industrial lighting. The types shown include enclosed lanterns for half-watt lamps, semi-indirect half-watt fittings for offices and public interiors where glare would be objectionable. Several types of anti-Zenoplium reflectors, of which many thousands have been sold during the last few weeks, are shown, as well as a new concentrating reflector specially designed for workshop and office local lighting, and large reflectors for the larger types of half-watt lamps specially made for positions where it is proposed to replace arc lamps.

REASON MANUFACTURING CO., LTD., Lewes Road, Brighton.—New catalogue, complete, with the exception of the street lighting fittings section, which will be ready shortly. The five sections now before us consist of a number of well illustrated leaflets filed in an expanding binder case. They deal respectively with electrolytic meters, maximum demand indicators, hand and electrically-wound time switches, fuse-boxes, current limiters, &c. In a number of cases dimensioned diagrams appear, and all prices are very boldly printed. Complete prices of the instruments are stated; as extras only such devices as are not necessary to the successful working of the various instruments are given.

THE BRITISH THOMSON-HOUSTON CO., LTD., Rugby.—Descriptive list No. 7,201 giving particulars and dimensions of small-power motors for A.C. and D.C.

SWEDISH GENERAL ELECTRIC, LTD., London, W.C.—Three illustrated catalogues dealing respectively with split-phase motors, single-phase motors and A.C. fans of Century U.S.A. types.

Book Notices.—"Journal of the Institution of Electrical Engineers." Vol. LIV, April 1st, 1916, No. 258.—This issue contains the following papers:—"Continuous-current Railway Motors," by Mr. E. V. Pannell; "Application of Telephone Transmission Formule to Skin Effect Problems," by Prof. G. W. Howe; "Magnetic Behaviour of Iron at very High Frequencies," by Mr. N. W. McLachlan; "Duplex Balances on Long Submarine Cables," by Mr. W. Judd; "Notes on Electrical Work in Australasia," by Mr. C. J. Calman; and a Report on Insulating Oils.

"On the Relation of Imports to Exports." By Mr. J. Taylor Peddie. London: Longmans, Green & Co. Price 5s. net.

"Technological Papers of the Bureau of Standards." No. 62. "Modern Practice in the Construction and Maintenance of Rail Joints and Bonds in Electric Railways." Washington: Government Printing Office.

"Quarantining Germany: A Common-sense Precaution." By P. J. Ford. Glasgow: J. Maclehoose & Sons. Price 1d.

"Continuous-Current Engineering." By A. Hay. London: Constable & Co. Price 6s. 6d. net.

"The Dynamical Theory of Gases." (2nd edition). By J. H. Jeans. London: Cambridge University Press. Price 16s.

"Alternating Currents." By H. R. Kempe. London: Crosby Lockwood & Co. Price 3s. 6d. net.

Russian Trade Possibilities.—The *Electrical World* states that Mr. Marcus Stowe Hill, who recently returned from a seven months' stay in Europe as the representative of 18 large Middle West manufacturers, reports excellent trade possibilities for electrical goods in Russia. "The markets of the country, he said, are absolutely bare. The merchants are hungry for American goods, and American Consuls are flooded with inquiries as to where all kinds of manufactured articles can be purchased. Orders for great quantities of telephone and telegraph apparatus and for tons of wire are awaiting American manufacturers. There is an exceptionally strong demand for small motors from ½ H.P. to 4 H.P. Electrical equipment for demonstrating purposes in schools, X-ray apparatus, batteries and absolutely all kinds of electrical supplies are wanted in large quantities. Mr. Hill said that when he left Petrograd there was not a dry cell in the city to be purchased, and he repeats that the market shelves are practically bare of everything. Between 125,000 and 150,000 resident German merchants and manufacturers have been sent to Siberia, and the Russians are anxious that Americans should take their place. They are offering to provide three-fifths of the required capital investment if Americans will furnish the other two-fifths and the brains to establish American manufacturing plants in Russia. Mr. Hill has been working in Russia on a basis of sales direct from manufacturers to dealers, eliminating the commission system under which Russia has been greatly handicapped. In the purchase of manufactured articles at the present time it is not so much a matter of price as it is one of getting the goods, for the prices being quoted by American manufacturers, while very substantial, are nevertheless considerably under what the German merchants, acting as jobbers in Russia, have heretofore charged for the same articles. The Russian credit, Mr. Hill said, is not only unquestionable but there is a great abundance of ready cash in the country, more so at this time than ever before. This is on account of the fact that the use of vodka has been abolished.

American manufacturers have, he stated, a great advantage over British manufacturers in shipping goods to Russia in that the latter must make application to the War Office for permission to export. At the least, it is three months before they get a decision, and permission may then not be granted. American manufacturers thus receive a tremendous advantage on time of delivery, which is one of the very important considerations under present conditions. The Russians are prepared to pay the price

because of the shipping difficulties, and they will furnish bankers' irrevocable confirmed credits with each order. Any firm contemplating granting a sole agency to a Russian is warned by Mr. Hill to investigate the standing of the individual very closely before so doing, to determine whether he intends to use this agency or to sell it. He says that a great many sole agencies are passed around from one man to another, none of whom knows anything about the business involved or cares to do so, since he only intends to sell the agency for \$2,000 or \$3,000 to the next man. Mr. Hill urges that no agency be granted until the reliability of the proposed agent has been positively established."

Machine Tool Association.—The annual report of the Machine Tool and Engineering Association shows a membership of 134. The matter of date of the next exhibition being dependent upon the coming of peace, cannot yet be settled definitely. "In view of the fact that the existing classifications of machine tools for Customs purposes is very imperfect, in consequence of which the Board of Trade returns are very misleading, representations have been made to the Board of Trade, and a promise has been given that the matter shall receive attention after the war, during which no alterations are being made to the classifications." "Negotiations have been opened with the British Electrical and Allied Manufacturers' Association with a view to the re-adjustment of certain trading practices as between machine tool makers and electrical manufacturers. While it is not possible to continue usefully the negotiations at present, it is proposed to resume them after the war. A recommendation was made to the members as to the attitude to be adopted to firms having connections, direct or indirect, with alien enemies."

Russian Trade Exhibitions.—A Renter dispatch from Petrograd states that the Odessa branch of the Anglo-Russian Chamber of Commerce, with a view to the improvement of economic relations between Great Britain and Russia, has decided to open an exhibition of Russian goods in London, and an exhibition of British goods in Odessa.

LIGHTING AND POWER NOTES.

Accrington.—**PROPOSED EXTENSIONS.**—At the Council meeting, last week, Mr. Ashworth moved that certain alterations and additions at the electricity works be referred back. He thought they ought to extend on a new site, and not spend money on the present works; he also urged the calling in of an expert. Ald. Higham explained that in going in for steam turbo-generators they were reverting to lines adopted by all the Councils in the country; they departed from orthodox lines when they went in for gas engines. With steam turbo-generators and the present lodge and a water tower, they would have sufficient capacity to deal with 4,000 kw. of plant. The amendment was lost.

Argentina.—A public electric light service has been inaugurated at Diamante (Entre Rios).

The Ministry of Finance has authorised the Direccion-General of the Port of Buenos Aires to arrange with the Compania Italo-Argentina de Electricidad for the suspension of the work of renewal of lighting material for a period of three years. This decision represents a saving of \$23,000 gold per annum, so long as the arrangement subsists.

Bacup.—**BULK SUPPLY.**—The Rawtenstall Corporation has offered to continue the supply of energy to Bacup from the end of the first period of five years (August 2nd next), on existing terms, and the matter has been referred to a Sub-Committee. The Rawtenstall T.C. has also given notice that from the 1st inst. the basis price of coal for the purpose of charging large power consumers has been further advanced 1s. per ton.

Beckenham.—The Council has decided that in future the charge for electricity used at the various hospitals and homes in the district shall be at the rate of 3d. per unit.

Birkenhead.—**LOAN SANCTION REFUSED.**—The L.G.B. has refused to sanction the borrowing of a loan of £6,400 for high-tension plant, mains, &c., on the ground that the extensions cannot be regarded as complying with the official stipulations.

Bolton.—**LOAN SANCTION.**—The L.G.B. has sanctioned the borrowing of £2,281 for purposes of the electricity undertaking.

Bradford.—**PLANT EXTENSIONS, &c.**—The Electricity Committee has come to an agreement with Messrs. Jeremiah Ambler & Sons, with reference to a bulk supply of electricity. The electrical engineer's estimate of the cost of extensions to the boiler house and cooling plant at Valley Road electricity works now on order or in contemplation, amounts to £53,113. The L.G.B. has given formal sanctions to the borrowing of two sums of £20,102 and £6,814 respectively, parts of the above-mentioned sum of £53,113, and the Committee has decided to adopt the estimate, and to make application to the L.G.B. for sanction to the borrowing of £26,196, the balance of the sum of £53,113.

Carnarvon.—**PROPOSED LOAN.**—Application has been made by the T.C. for sanction to a loan of £2,780 for a 100-kw. Diesel engine set, with fuel storage tanks, switchboard, &c., for the electricity works.

Continental.—**RUSSIA.**—It is stated that, notwithstanding the war, the Russian Government is making preparations for an extensive utilisation of the watercourses of Finland for the generation of electricity for lighting and power purposes.

ITALY.—In connection with the destruction of the Conti electricity works in the Val Brembana, it is reported in the *Revista Tec. d'Electricità*, that in consequence of the heavy snowfall an attempt was made to shut down the supply, but a short circuit occurred which resulted in the entire destruction of the plant, the loss being about a million lire.

Dartford.—**LOAN APPLICATION.**—The U.D.C. has applied to the L.G.B. for sanction to borrow a loan of £1,000 excess expenditure on extensions to the E.L. station and plant, and to cancel £75 not spent in connection with an overhead cable.

Doncaster.—**ELECTRIC PUMPING PLANT.**—The Water Committee of the Council has had under consideration a report of the engineer regarding the existing plant in use for pumping river water, and at the last meeting it was proposed to abandon the present pumps and boiler, and to install electrical pumping plant capable of delivering water under pressure of 120 ft. head, at an estimated first cost of £300, and an annual cost of £340.

Dungannon.—**HOSPITAL LIGHTING.**—The Co. Tyrone Tuberculosis Committee has decided to recommend the installation of an electric plant in the new sanatorium.

East Cowes.—**STREET LIGHTING.**—The U.D.C. has accepted an offer by the Isle of Wight E.L. and Power Co. of a further allowance of 30s. per lamp for the lights to be dispensed with from April 1st to September 30th. The company had already reduced the charges for public lighting by one-half to 31s. 9d. per lamp per quarter.

India.—**STREET LIGHTING.**—The Calcutta Electric Supply Corporation is pushing forward energetically the preparations for lighting Chowringhee with 900-c.p. half-watt lamps.

The electrification of the Bombay cotton mills is now nearly completed; motors of approximately 36,000 H.P. have been installed, divided amongst 26 mills, in addition to complete sub-station equipments for 30 cotton mills and two flour mills.—*Indian Textile Journal*.

Indian Engineering states that the Ootacamund Municipal Council has decided that the question of electrically lighting the town by suction-gas engine plant must stand over in consequence of the high price of the plant, and the probability that it might not be obtainable at all at present.

London.—**WESTMINSTER.**—The St. James's and Pall Mall Electric Light Co. has advised the City Council that it will be compelled from June 24th next, to charge for electricity for lighting purposes at 4d. per unit net. It is not proposed to increase the charge for power supply. The Contracts Committee has instructed the city engineer to report as to the practicability of substituting and using gas lighting, and the cost thereof, at those buildings now lighted by current supplied by the St. James's Co.

BATTERSEA.—The Electricity Committee has been in negotiation with the Fulham B.C. with reference to the supply of electricity in bulk under the terms of the linking-up agreement. The electrical engineer reports that the test supply given by Fulham during January to March has been satisfactory, and the Committee is arranging for a continuance of this supply during the year ending March, 1917.

Manchester.—**LOAN SANCTIONS.**—The L.G.B. has sanctioned the borrowing of £30,000, repayable within 15 years, for equipment of sub-stations, and £10,000, repayable within 10 years, for the provision of motors for hire.

The Education Committee has accepted an offer by the Electricity Committee with regard to the electric lighting of the Municipal School of Art extension.

Nelson.—**NEW PLANT.**—The electrical engineer has been instructed to obtain estimates for a complete turbo-generator set.

Nuneaton.—Subject to satisfactory terms being arranged, the T.C. has decided to extend the mains to Weddington Hall Hospital. It is anticipated that other consumers will be secured en route.

Rathmines.—**STREET LIGHTING.**—The Urban Council has decided that every alternate public electric lamp shall be left unlighted during the present financial year with a view to saving expense.

Rotherham.—**NEW PLANT.**—The Electric Light Committee proposes to purchase an additional rotary converter to meet the demand from Timeley, and has accepted an offer for the supply of such plant for £690, the money to be defrayed out of the renewals fund.

Scarborough.—**STREET LIGHTING.**—The T.C. has instructed the Lighting Sub-Committee to consider the question of electric lighting in certain main streets after the war; the public gardens have been electrically lighted for some time, but the streets are entirely gas lighted.

South Africa.—A domestic water scheme and electric lighting installation has been completed at Pietersburg, and Mr. Curtis, late town engineer of Wimbarg (O.F.S.), has been appointed engineer. Mr. H. Hancock, of Klerksdorp, acted as consulting engineer, and Mr. R. Turnbull Mawdesley acted as his representative on the construction works.

Stockton-on-Tees.—**YEAR'S WORKING.**—The loss on the Corporation electricity undertaking for the past year amounted to £1,008, against £651, as estimated. Sales of current produced only £9,120, being about £680 short of the estimate, due to lighting restrictions, while for public lighting only £62 was received against the estimated £300. The total income was £9,509, instead of the estimated £10,325, the actual expenditure being £10,517, or £459 less than anticipated. For the current year a loss of £1,998 is estimated for; expenditure is estimated at £11,580, the large increase in the item being due to the purchase of electricity in bulk. The revenue is estimated at £80 more than that received last year.

Teignmouth.—The U.D.C. has decided not to object to the whole of the proposed electrical mains in Shaldon being overhead, subject to steel poles being used in certain streets, and to the proposed Shaldon Electric Lighting Co-operative Society entering into an agreement with the Council on similar terms to the agreement with Messrs. Purves, subject to such modifications as may be necessary.

Torquay.—During the past month 158,490 units were generated at the electricity works, an increase of 29,675 units as compared with the corresponding month last year. For the year 1915 the electricity undertaking shows a net profit of £1,200, which has been expended on services.

Wakefield.—**PRICE INCREASE.**—In view of the increased cost of generating electricity, the charges to power consumers are to be increased by 12½ per cent. and cash discounts are to be abolished.

U.S.A.—The Great Western Power Co. has carried out an extensive investigation into the possibilities of electro-chemical development in the Californian area which it serves, and a company has now been organised, to be known as the Great Western Electro-Chemical Co., which is to erect an initial installation on a 15-acre site at Pittsburg, Cal., to produce caustic soda and bleaching powder. The plant will be the first of the kind west of Detroit.

Walsall.—The Committee has decided to place certain sums received on the sale of superseded plant to a special account, to be utilised in repayment of the outstanding debt on plant.

Wigan.—In connection with the proposed supply of current to the premises of the Northern Coarse Spinners, Ltd., the Electricity Committee has decided to apply for permission to borrow £781 for cable, switchgear and a transformer. The motors and the electric lighting installation at the mill of the Coarse Spinners, Ltd., are being supplied by the Corlett Electrical Engineering Co., Ltd., Wigan. Mr. H. Dickinson, city electrical engineer of Liverpool, is to report on the electricity undertaking for the fee of 150 guineas.

Wolverhampton.—**PLANT EXTENSIONS, LOANS, &c.**—The Electricity Committee reports that the continual demand for energy renders it necessary to make extensions to the generating station plant, in order to cope with the load during the winter of 1917. Having considered reports of the electrical engineer (Mr. S. T. Allen) upon the question, the Committee recommends the extending of the boiler house, at a cost of £17,160, made up as follows:—Building, £1,000; steel work, bunkers, &c., £2,200; two water-tube boilers (40,000 lb.), complete with mechanical stokers, £8,000; feed, steam and blow-off piping for boilers, £500; forced draught plant, £500; feed pump plant, £400; coal and ash-conveying plants, including ash-bunker, £2,500; erecting a steel chimney on foundations already provided, £500; contingencies, £1,560. The Committee further recommends that application be made for sanction to borrow the above-mentioned sum, and that it be authorised to invite and accept tenders for all necessary works. It is also proposed to make application for permission to borrow £6,600 for defraying expenditure to be incurred in connection with extensions to mains, foreshadowed in the report.

TRAMWAY AND RAILWAY NOTES.

Bacup.—Consideration has been given to proposals from the Rawtenstall Corporation for alterations in the tramway fares, but the Electricity and Tramways Committee is unable to agree to the proposals, holding that the increases would be paid entirely by Bacup.

Burnley.—The Tramways Committee has considered the question of the financial position of the undertaking, and has decided that the charges for all privileged tickets shall be increased by 7½ per cent.

Bradford.—**YEAR'S WORKING.**—The tramway manager has submitted a report showing the approximate result of the past year's work of the tramway undertaking. The estimated total receipts were £334,315, an increase of £14,921 as compared with the previous year; the total number of passengers carried was 74,000,000, an increase of 4,000,000 on the previous year's figures; wages £129,313, show an increase of £9,182, whilst the department had paid a sum of £7,102 in war bonus and £7,352 to dependents of employees who had joined the Forces. There had been an increased consumption of electricity in connection with the tramways, notwithstanding the fact that the car mileage was less than a year ago—this being attributed to the larger loads, the severe weather conditions, and the absence of many old and skilled drivers. This increased consumption will involve an amount of something like £1,000 being charged against the undertaking. Last year's car mileage was 6,199,601, a decrease of 172,109 miles.

The Traffic and Fares Sub-Committee of the Tramways Committee of the Corporation has authorised the general manager (Mr. C. J. Spencer), to engage additional women conductors whenever male labour for the purpose is not obtainable. The tramway manager has received authority to equip an electric lorry, or to place an order for a suitable petrol chassis. In response to an instruction of the City Council for the Tramways Committee to report at the April meeting as to what it can do to deal equitably with all tramway fare stages in the city (including Great Horton), the Committee states that it will not be in a position to submit the desired report until the balance sheet has been prepared.

Continental.—**SPAIN.**—The Sociedad de Tranvia Urbano de Bilbao has applied for a concession to construct and work an extension to the existing tramway system in the town of Bilbao to the Barrio de Itzai Barri.

Croydon.—**STRIKE.**—A strike occurred on Saturday morning last among the drivers and conductors on the South Metropolitan Tramway Co.'s system running to Sutton, Tooting, Penge, &c., owing to two women receiving instruction in driving for test purposes. A restricted service was maintained over the week-end, the Tooting route being closed.

Later information shows that the strike has spread to the employees of the Croydon Corporation tramways—who demand concessions in regard to wages and hours—and a reduced service is being given on the Corporation lines. The Croydon authorities state that the increase in wages, and other concessions in their case, would cost £10,000 a year, and would equal a 2½d. rate on the town. The B. of T. intervened in the dispute on Tuesday, without result, and there appears to be a prospect of the strike spreading.

Doncaster.—At a meeting of the T.C. last week, at which the local rates were reduced by 4d., satisfaction was expressed at the success of the new Woodlands tramway route. In five weeks 23 006 passengers have been carried, and it was stated that a reduction of fares on the route was under consideration.

Edinburgh.—The Tramways Committee has reported against any immediate decision to adopt electric traction on the tramways when taken over; the burgh engineer is to report on the matter at a later date. Councillor Allan has a motion before the Council urging the adoption of some form of electric traction when the company's lease expires.

Gateshead-on-Tyne.—The Town Improvement Committee has received a letter which has been sent to the Gateshead and District Tramways Co. by the B. of T., with reference to the accident on Bensham Bank, in which Lieut. Colonel Von Dnopp, R.E., calls attention to the fact that a slight change in the position of Ravensworth loop would provide a better gradient for cars to stand on, and, further, recommends that motormen should not leave their cars during the journey. The Committee has written to the company, inquiring what action it was proposed to take, and the company has intimated its willingness to carry out the suggestions. The matter was left in the hands of the Town Improvement Committee with full power to act.

Halifax.—**YEAR'S WORKING.**—The financial statement of the borough treasurer shows that the total income of the Corporation tramways during the past year has been £113,492 (£12,404, per car-mile), whilst the expenditure has totalled £95,186 (£10,363, per car-mile), leaving a profit of £18,006, as compared with £17,052 for the preceding year. The number of passengers carried showed an increase of 1,316,932 at 21,024,003.

Leeds.—From a statement which has been issued by the tramway department it appears that the receipts for the year ending March 31st last (£3475,661) show an increase of £11,150, as compared with those of a year ago. There has been a decrease in the car-mileage (9,405,121) of 117,616 miles, due to inability to use the full stock of cars owing to enlistment of employees. The number of passengers carried showed an increase of 7,814,553 at 103,453,801. The receipts per car-mile (12'183d.) increased by 1'187d.

London.—**KENSINGTON.**—The B.C. has been recommended to raise no objection to the proposal of the M.E.T., Ltd., to use trailer cars, on the understanding that such consent is for the period of the war only.

Oldham.—**YEAR'S WORKING.**—The returns of the tramway department up to March 25th show, subject to audit, a profit of £3,985. On the Hollinwood extension £1,000 has been expended, and allowances to employees with the Colours have amounted to £5,225. Ald. Isherwood told his Committee, on April 6th, that the result was as good as the Committee had ever had.

Rochdale.—**TRAMWAY LEASE.**—The Tramways Committee has intimated that it cannot accept the draft lease of the Milnrow tramways as returned and altered by the Milnrow D.C., and further suggests that the matter might be postponed until after the war.

During the last year the total receipts of the tramway department amounted to £82,836, an increase of £4,477. The passengers carried numbered 13,705,871, an increase of 298,553.

Rotherham.—**ROLLING STOCK PURCHASE.**—The Tramways Committee has recommended the Corporation to exercise its option to purchase the additional 11 bogie trams from the Oldham Corporation. Repairs are to be carried out during the month to various parts of the tramway track.

Stockport.—The Tramways Committee has decided to accept the offer of £600, made by the General Electric Construction Co., Ltd., for one of the Corporation's railless trolley-buses.

Swansea.—**OVERHEAD BREAKDOWNS.**—The electrical engineer has reported on the number of breakdowns of overhead equipment on the Morriston section of the Corporation tramways during the past three months. He stated that practically all breakdowns were due to falling of guard wires. The tramway engineer reported that the steel guard wires originally installed had corroded to such an extent that the Tramway Co. had decided to replace them on a section of about six miles with bronze wire.

Swinton and Pendlebury.—**TRAMWAY LEASE.**—The U.D.C. has, subject to the approval of the B. of T., decided to lease the tramways to the Salford Town Council for 21 years from January 1st, 1905.

Warrington.—The free use of the tramway cars and municipal omnibuses by soldiers, other than wounded soldiers in hospital dress, is to be withdrawn, because the privilege has been abused.

TELEGRAPH AND TELEPHONE NOTES.

France.—The French Government has drawn up a Bill to be presented to Parliament, providing for an outlay of over 120,000,000 fr. for the improvement and extension of the telephone system of Paris. A technical Commission has been appointed, and has handed in its report. The chief provisions of the proposed scheme are as follows:—The construction and equipment of six large new telephone exchanges in Paris; the enlargement of three existing telephone exchanges; the introduction of new multiple switchboards for 12,600 lines; the installation of automatic meters in the Paris exchanges; and the laying down of long-distance subterranean lines.

The Telephone System.—Last month the laying of an underground cable between London and Liverpool was completed. Considerable progress has been made in restoring the overhead telephone lines brought down in the storm. Of 600 lines going out of London which were down, 370 had already been repaired by last week-end. Just after the storm there were from 40 to 60 important places in the country to which it was impossible to get through from London; on Saturday the number had been reduced to four.—*The Times*.

CONTRACTS OPEN and CLOSED.

OPEN.

Aberdare.—April 19th. U.D.C. Twelve months' supply of lubricating and other oils, for the Electricity and Tramways Department. See "Official Notices" to-day.

Australia.—**SYDNEY.**—May 24th. N.S.W. Government Railways and Tramways. 16/600-volt D.C. motors for tramway stores, Randwick.

April 26th. Victorian Government Railways. Car-lighting material—cables, switches, fuses, &c.

May 1st. City Council. Meters and maximum-demand indicators. See "Official Notices" April 7th.

May 10th. Victorian Government Railways. Motor-generator set and accessories for battery-charging of baggage trucks.

May 17th. Victorian Government Railways. One 2-ton electrically-operated goods elevator for Jolimont car-shed.

Manchester.—April 17th. B. of G. Electrical materials for Withington Institution in connection with the additional electric lighting of the main side of the establishment. Particulars from the acting master at the Institution, Neil Lane, West Didsbury, Manchester.

New Zealand.—June 23rd. Oamaru Borough Council. Overhead mains and street-lighting equipment (Contract No. 2); power-station equipment (Pelton wheels, alternators, &c.) (Contract No. 3); service meters (Contract No. 4); line transformers and accessories (Contract No. 5).*

North Africa.—May 30th. Sixty years' electric tramway concession for Melilla: work to be completed in two years. Tenders to Direccion General de Obras Publicas, Ministerio de Fomento, Madrid. The *Board of Trade Journal* contains some further particulars.

Salford.—April 17th. Electricity Committee. Switchgear for 5,000-kw. sub-station equipment. See "Official Notices" April 7th.

Walthamstow.—April 26th. U.D.C. Water-softening plant for the Electricity Department. See "Official Notices" April 7th.

Warrington.—April 26th. Electricity and Tramways Committee. Boiler plant and economiser. See "Official Notices" April 7th.

West Hartlepool.—April 28th. Electricity Department. Two water-tube boilers with superheaters and mechanical stokers. See "Official Notices" to-day.

Specifications for the items marked * can be seen at the Board of Trade Commercial Intelligence Branch in London.

CLOSED.

Belfast.—Messrs. Vanner Time Switches, Ltd., have received a contract from Belfast Corporation for automatic time switches for a year.

Bradford.—The Electricity Committee has accepted the tender of Messrs. Haywards, Ltd., for glass flooring, and that of Messrs. Redpath, Brown & Co., Ltd., for constructional steelwork required at the Valley Road electricity works; also offers for plant for the Valley Road works as follows:—

Mugrave & Co., Ltd.—Induced-draught plant and two steel chimneys. Electromotors, Ltd.—Three 50-h.p. pipe-ventilated fan motors. Ferranti, Ltd.—Two 250-k.v.a. transformers.

Burton-on-Trent.—T.C. Jonathan Longbotham and Sons are to supply 4,000 tons of coal to the Lighting Department.

Gillingham (Kent).—T.C. Coal for the electricity works:—

Household screenings, Gillingham Co-operative Society, 20s. per ton; ditto, Anderson, Cornelius & Snow, Ltd., 30s. 6d. per ton; 300 tons Baddeley 14 in. nutty slack, Clewes & Co., 26s. 5d. per ton; Welsh coal, J. Gill & Son, 30s. 9d. per ton.

Gloucester.—T.C. Tramway points and crossings: Edgar Allen & Co., Ltd., £2,500.

London.—HAMMERSMITH.—The Electricity Committee recommends the acceptance of the offer by Messrs. Cory Bros. to supply 100 tons weekly for six months of Abercwyd coal, at 23s. 6d. per ton.

Meter Contracts.—Messrs. Chamberlain & Hookham, Ltd., have received contracts for electricity meters for the ensuing 12 months from Pembroke, Walthamstow and Bermondsey.

The Electrical Apparatus Co., Ltd., has received a contract for a year's supply of electricity meters for the borough of Basingstoke.

Nuneaton.—T.C. Coal for the electricity works for a year:—

Haunchwood smudge (1,070 tons), Wm. Jeffcoat, Ltd., 9s. 6d. per ton; Ansley Hall smudge (1,500 tons), Mr. Geo. Smith, 9s. 6d. per ton.

Sheffield.—City Council. The following tenders are recommended for acceptance:—

W. Marlow & Sons, Ltd.—Erection of electricity sub-stations: Sidney Street, £1,011; Stanley Street, £1,216. Mortimore, Lyon & Co.—Increasing efficiency of the six-cell unit at Lumley Street destructor by 75 per cent., £1,029. Edison Accumulators, Ltd.—Three-ton wagon, £1,200; two-ton wagon, £1,000.

Sunderland.—The T.C. on Wednesday accepted the following tenders:—

Babecock & Wilcox.—Superheater tubes. G. & J. Weir.—Impellers for boiler feed pumps. I.R., G.P. & Telegraph Works, Ltd.—Insulating tape. Dussek Bitumen Co.—Box compound. W. Simpson.—Hand-carts.

Swansea.—Council. Ferranti, Ltd., at £66, for a three-phase transformer for supplying a new school.

Wimbledon.—The Electricity Committee considers it undesirable to enter into contracts for supplies during the ensuing year. The borough electrical engineer has obtained offers from certain firms for the supply of various goods and materials, which the Committee recommends for acceptance, and also that the remainder of the supplies required should be purchased as and when required at the lowest prices obtainable.

Wolverhampton.—The Electricity Committee recommends the T.C. to accept the following tenders:—

Brush Electrical Engineering Co.—Two 800-kw. transformers, £399 10s. Reyrolle & Co.—Switchgear, £796. Stirling Boiler Co.—Two Stirling boilers, two super-heaters, and two sets of mechanical stokers, £8,292.

FORTHCOMING EVENTS.

Institution of Mechanical Engineers.—Friday, April 14th. At 6 p.m. At Great George Street, S.W. Paper on "Theory and Practice in the Filtration of Water," by Mr. W. Clemence.

Physical Society of London.—Friday, April 14th. At 6 p.m. At the Imperial College of Science, South Kensington, S.W. Papers on "The Variation of Resistance with Voltage at a Rectifying Contact of two solid conductors with applications to the Electric Wave Detector," by Mr. D. Owen; and "The Electrical Capacity of a Gold-leaf Electroscope," by Mr. T. Barratt.

Chief Technical Assistants' Association.—Saturday, April 15th. At 3 p.m. At the Tavistock Hotel. Discussion on "The Advantages and Disadvantages of Various Systems of Laying Mains."

Royal Institution of Great Britain.—Friday, April 14th. At 5.30 p.m. At Albemarle Street, W. Lecture on "The Genesis and Absorption of X-rays," by Prof. Sir J. J. Thomson. Saturday, April 15th. At 3 p.m. At Albemarle Street, W. Lecture (VI) on "Radiation from Atoms and Electrons," by Prof. Sir J. J. Thomson.

Institution of Civil Engineers.—Tuesday, April 18th. At 5.30 p.m. At Great George Street, S.W. Annual general meeting.

Post Office Telephone and Telegraph Society of London.—Tuesday, April 18th. At 6.30 p.m. At the I.E.E., Victoria Embankment. Paper on "Telegraph Tariffs and Economic Needs," by Mr. J. Lee.

NOTES.

Easter Holidays.—Owing to the Easter Holidays, the *ELECTRICAL REVIEW* for Friday, April 21st, will be published on Wednesday, April 19th. All matter for both the editorial and advertisement pages for that issue should be in our hands at the earliest possible moment. A notice regarding the latest times for advertisements to be received, appears in our advertisement pages to-day.

Foreign Trade.—THE MARCH FIGURES.—The following are the electrical and machinery figures given in the official returns for March:—

IMPORTS.

Electrical goods and apparatus, excluding machinery and un-insulated wire...	Month of March.	Inc. dec.	Inc. or dec. to date compared with 1915.
...	£115,409	+ £47,783	+ £137,236
Machinery ...	685,507	+ 103,419	+ 225,891

EXPORTS.

Electrical goods and apparatus, excluding machinery and un-insulated wire...	Month of March.	Inc. dec.	Inc. or dec. to date compared with 1915.
...	328,173	+ 51,203	+ 186,011
Machinery ...	1,424,140	- 166,294	- 110,860

Gas v. Electricity.—An Indian contemporary quotes a recent article in the *American Gas Age*, which sums up the results of an investigation as follows:—"It can be said that there is no question but that gas lighting stands before electric lighting in every respect, for the latter causes no vitiation of the air, develops no humidity and moisture and produces little heat." It appears from the results of experiments that the claims for superior ventilating effect of gas are unfounded. The tests made were various, one of these being the cooking of sauerkraut in the room, and then observing how long the odour could be detected in the room. There was no difference in the room lighted by gas or electricity. Tests for CO₂ showed a higher percentage for gas, and two curves illustrating the decrease of bacteria in the air, when subjected for a definite time to gas or electric lighting, showed little difference.

Vacuum-Fused Silicon Iron.—In the *Bulletin* of the American Institute of Mining Engineers, Mr. T. D. Yensen, of the University of Illinois, has given the results of his experiments on vacuum-fused iron containing varying percentages of silicon. The experiments were made in an attempt to improve the iron used in dynamo-electrical machinery. The qualities desired were low hysteresis loss, high electrical resistivity (to reduce eddy-current loss), and high permeability. Previous experiments by the author had shown that pure electrolytic iron, melted and cooled in vacuum, possessed desirable properties in respect of high permeability (about twice that of the best commercial iron) and low hysteresis loss. If the electrical resistivity of this iron, which in the pure state is very low, could be increased without impairing its magnetic properties, an excellent iron for electromagnet purposes would be produced. Previous experiments by Prof. C. F. Burgess, at the University of Wisconsin, had shown that when melted in an atmosphere of carbon monoxide at ordinary pressures, pure iron absorbed about 0.1 per cent. carbon, and probably some oxygen, as the electric resistance increased more than would be expected from the carbon alone. The iron used in the present experiments was doubly refined electrolytic iron deposited from Swedish charcoal iron, according to the methods of Burgess. The refined iron had the following composition:—Carbon, 0.006 to 0.01 per cent; silicon, 0.01 per cent; sulphur, trace; iron (by difference), 99.98 per cent. Previous experiments by the author had shown that carbon and boron, when alloyed with this vacuum-fused iron, lowered the magnetic quality, and they were thus undesirable where high permeability and low hysteresis were needed. The present experiments with silicon gave opposite results, and seem to have produced

an iron which possesses very remarkable properties, highly desirable in iron for electrical machinery.

The maximum tensile strength of 105,000 lb. per sq. in. (73.5 kg. per sq. mm.) occurs with a silicon content of 4.5 per cent.

With regard to the magnetic properties, the best alloys are obtained with about 0.15 per cent. and 3.40 per cent. silicon after annealing at 1,100° C. The maximum permeability for both of these alloys is above 50,000, and the hysteresis loss for $B_{max} = 10,000$ and 15,000 is about 300 and 1,000 ergs per cb. cm. per cycle respectively. This hysteresis loss is $\frac{1}{4}$ and $\frac{1}{2}$ of the corresponding loss for commercial silicon steel. The most favourable annealing temperature is in every case 1,100° C.

The specific electrical resistance increases about 13 microhms for the first per cent. silicon added. For each additional per cent. added the increase is about 11 microhms. Consequently, the 3.40 per cent. alloy mentioned above has a resistance more than four times that of the 0.15 per cent. alloy.

By the vacuum process two silicon alloys have thus been produced that have very valuable characteristics: one low in silicon, not very strong, but extremely ductile, of high permeability, low hysteresis loss, and low electrical resistance; the other high in silicon, very strong, moderately tough, of high permeability, low hysteresis loss, and high electrical resistance. The properties of these alloys are summarised in the table below. The first is evidently suitable for use in places where high permeability and low hysteresis loss are the chief requirements, while the second alloy is suitable for electromagnetic machinery, principally transformers, where a low eddy-current loss is an additional requirement.

PROPERTIES OF THE TWO BEST IRON-SILICON VACUUM ALLOYS.

Silicon content per cent.	Stress at yield point, lb. per sq. in.	Ultimate strength, lb. per sq. in.	Elongation, per cent.	Reduction of area, per cent.	Maximum permeability.	Density at max. permeability, lb. per cu. ft.	Hysteresis loss, ergs per cycle.	For $B_{max} = 10,000$	For $B_{max} = 15,000$	Specific electric resistance, microhms.
0.15	18,500	37,000	55	99.0	Above 50,000	6.503	285*	916†	11.8	11.8

—Met. and Chem. Eng.

Institution and Lecture Notes.—**Institution of Electrical Engineers.**—The annual general meeting of the Institution will be held on Thursday, May 11th, at 8 p.m., to receive and consider the accounts for the year ended December 31st, 1915, and the annual report of the Council, and to elect two auditors.

In view of the Government restrictions with regard to the supply of paper, and also owing to the great increase in its cost, the Council has decided to reduce the amount of matter in the *Journal*, and to publish it monthly, instead of fortnightly, until conditions are again normal.

At the meeting of the YORKSHIRE LOCAL SECTION on Wednesday last, a paper was read by Mr. G. George Wilkinson on "Electric Heating: Its Present Position and Future Development."

Iron and Steel Institute.—The annual meeting will be held on May 14th and 5th, at the Institution of Civil Engineers. After the presentation of the Bessemer Gold Medal to Mr. F. W. Harbord, F.I.C., and the delivery of the inaugural address of the President, Sir W. Beardmore, a number of papers will be read, including one by C. Benedicks, Ph.D., on "A New Thermo-Electric Method of Studying Allotropic Changes in Iron or other Metals." The following new by-laws, as already proposed and amended, will be formally moved and voted upon during the proceedings:—

1. In the event of a state of war existing between the United Kingdom and any other country or State, all members, honorary members, and honorary vice-presidents who shall be subjects of such enemy country, or State, shall forthwith cease to be members, honorary members, or honorary vice-presidents of the Institute, but they shall be eligible for re-election after the war in the usual manner.

2. The Council shall have absolute power to remove from the list of members of the Institute the name of any member, whether ordinary or honorary, for wilful contravention of the by-laws or for any other reason which seems to them sufficient, and such ordinary or honorary member shall thereupon cease to be a member of the Institute.

The autumn meeting will take place in the same building on September 21st and 22nd.

Electrical Association of Australia.—Recently in a paper read before the N.S.W. Section, Mr. Wm. Corin, chief electrical engineer of the N.S.W. Public Works Department, read a paper on the "Power Requirements and Resources of N.S.W.," attention being particularly given to the applications of electricity. The H.P. of various types of stationary industrial prime movers in use in 1913: was steam, 67,045; gas, 12,294; water, 77; oil, 1,142 (total non-electric, 80,568 H.P.); electric, 35,885 H.P.; excluding electrical power stations. At the beginning of the century the H.P. supplied by other forms of prime mover was 112 times that supplied by electric motors, in 1913 the ratio had been reduced to 24 times; the electric motor curve shows an accelerating upward tendency, while the non-electric curve indicates retardation in the rate of increase. He anticipates that in the next 16 years stationary industrial purposes will require 381,000 H.P. additional to 1913, i.e., a total of 497,000 H.P., of which 416,000 H.P. may be anticipated to be electrical. He further estimates that this will require 300,000 kw. of plant and represent the use of 600 million units a

year, and points out that anything up to half this amount may be required for electrochemical and electrothermic processes alone and the total may be largely increased. In 1913 there were in N.S.W. 113 townships of 1,000 inhabitants and upwards, with a total population of 350,000, and by 1930 he anticipates that there will be 170 such townships with half a million population. Assuming that these will demand an electric supply for lighting and small power uses, he estimates a further demand of 15,000,000 units a year and a maximum load of 15,000 kw. If power were available on a comprehensive scale, a great impetus would be given to the use of power-using contrivances for all agricultural purposes. Mr. Corin considers that railways and tramways will require 185,000 kw. additional, and suggests a total demand in 1930 for 700,000 kw. or 1,850,000,000 units. He further deals with the coal and water-power resources of the State, mentioning that he is carrying out a systematic preliminary examination of the whole of the water-power resources.

The Chemical Society.—An extraordinary meeting of the Fellows is to be held on May 11th, to consider the question of removing from the list of members the names of nine alien enemies. In the annual report of the Council, presented to the Fellows on March 30th, it was stated that the Council, by a large majority, had decided that no steps should be taken in this direction until after the cessation of hostilities; but the meeting, by a large majority, repudiated this view, with the result above mentioned. The Fellows have not forgotten that the use of poisonous gas originated in Germany, and will for ever remain a foul stain on the fair fame of chemical science.

In an address to the HALIFAX, N.S., COMMERCIAL CLUB recently, a scheme to harness the Bay of Fundy tides for the development of hydro-electric power was outlined. The proposal is to install tidal motors in Minas Channel, where the flow is between 9 and 11 miles an hour, by means of which sea-water would be pumped up into reservoirs on the cliff top, subsequently being used to develop a steady output of electricity in a power house at sea level. A suitable type of tide motor has already been developed experimentally. The most suitable power site is at Cape Split, which is within 125 miles' distance of most of Prince Edward Island, and about 85 miles from Halifax. It is estimated that the scheme would render 2 million H.P. available.

Decimal Coinage and the Metric System.—The report of the DECIMAL ASSOCIATION for the past year, which was issued recently, draws attention to a distinct advance during the year in public (as differentiated from scientific) opinion in favour of the adoption of the decimal system of coinage and the metric system of weights and measures, especially in commercial circles. The severity of the handicap imposed upon our manufacturers by the use of two systems in the works and offices and by the complicated nature of the British system is emphasised, but it is pointed out as a hopeful feature of the situation that the war has familiarised our armies with the metric system, and after the violent changes which the nation has already experienced it is more ready than formerly to entertain proposals of reform. In November last the Association circulated the Chambers of Commerce of the United Kingdom, inviting them to induce their members to introduce the metric system into their own works, and received a favourable response, all the replies expressing complete agreement with the work of the Association. The use of metric equivalents of all British standards in parentheses in recent specifications issued by the Engineering Standards Committee is welcomed, and resolutions urging the general and immediate adoption of the metric system which were passed by the Council of the British Horological Institute and the Committee of the London Wholesale Jewellers' and Allied Trades' Association are recorded. The fact that last year no fewer than 38,373 metric weights and measures were submitted for testing in the City of London, as compared with 1,741 in 1914, to which we have already drawn attention, is quoted as a proof that the metric system is being more widely employed. The report further states that "the ELECTRICAL REVIEW has been conducting an extremely useful canvass among electrical engineering firms in regard to the desirability of adopting the metric system in this country," and reproducing the series of questions which we addressed to manufacturers, expresses gratification at the fact that there was a majority of four to one in favour of the general adoption of decimal coinage and the metric system. A similar canvass instituted by Messrs. Richard Klinger & Co. amongst engineering and kindred trades produced a like result.

The diversity of the systems of weights and measures in use in Egypt has led the British Chamber of Commerce of Egypt to recommend the adoption of the metric system (which is already used in all Government Departments, public works, post offices, and railways). The coinage is already decimal, the Egyptian pound being divided into 100 piastres of 10 millimes each (practically the system which we have recommended), and it is proposed by a very slight alteration to make the £E identical in value with the pound sterling. In January last the Second Pan-American Scientific Congress, sitting in Washington, U.S.A., passed a resolution urging the American Republics to adopt the metric system for all purposes. All the South American Republics already use it, and our trade with them is gravely prejudiced by our neglect to quote in the terms which their peoples understand. The income of the Association has suffered through the effect of the war, though a number of new supporters have joined it, and further support is urgently needed; the address of the Association is Finsbury Court, Finsbury Pavement, E.C.

With the report is issued a leaflet showing how decimal coinage can be adopted without altering the value of any of the gold and silver coins now in use in this country. The unit proposed is the

florin, the sovereign being the 10-florin piece; the florin would be divided into 100 cents, and new nickel coins, of the values of 10 cents (2½) and 5 cents (1½), would be introduced together with bronze coins denominated 4 cents, 2 cents and 1 cent, practically equal in value to the penny, halfpenny and farthing. In essence, the system is identical with that which we have recommended, for it retains the sovereign absolutely unchanged in value; whether the sovereign or its tenth part be regarded as the unit is purely a question of convenience.

At the spring meeting of the Lancashire, Cheshire, Cumberland, and Westmorland Division of the Incorporated Association of Head Masters, a resolution was passed urging head masters to emphasise the importance of the metric system, especially among boys who are leaving this year, and that special attention be devoted to practice in converting British into metric weights, measures, and coinage. A Sub-Committee was appointed to suggest ways of discovering and overcoming existing objections to the introduction of the metric system.

The *Indian Textile Journal* states that the Karachi Chamber of Commerce, in reply to Government, which invited its opinion on the reports of the Weights and Measures Committee, has replied that it is of opinion that any changes made should be in the direction of the decimal system.

The Electrification of Fibres.—The research which is about to be undertaken by the Leeds University into the causes of the electrification of fibres and fabrics during manufacturing processes will cover various classes of fibre, commencing with silk, as the phenomena are most readily produced with this material. Great interest is taken in the scheme by manufacturers, many of whom have offered their assistance. Hitherto the endeavour has been to cure the trouble; in the present research the fundamental causes will be sought with a view to preventing its occurrence. Wool, silk, cotton, and linen, says the *Yorkshire Observer*, all become electrified in the process of manufacture. The electrification of wool means that spinning from newly-made tops cannot be done satisfactorily. Sometimes tops have to be laid aside for at least a month before they are spun, and yarn is allowed to wait from 10 to 14 days before it is used. The tops of the yarn have to be put aside to allow the fibres to lose the electricity set up by the friction incidental to their manufacture.

Assuming a spinner to be producing 50,000 lb. of yarn per week, and the price to be 3s. a lb., the amount involved is £7,500. In the event of the reduction by a week of the time the yarn has to be allowed to lie to get rid of the electrification of the fibres, the saving to the spinner in interest alone would be about £30 a week. What this would mean throughout the textile industry cannot be comprehended except by the imagination of an exceedingly large sum of money. The importance of the forthcoming investigation will therefore be apparent. Attempts have been made, and with a considerable amount of success, to overcome the difficulty by the humidification of mills, and many mills are fitted with plant to humidify the atmosphere for this purpose. Humidification, however, is but a remedial measure after the electrification has taken place. The object of the research to be undertaken by Dr. Shorter is radical—an attempt is to be made to eliminate the electrification. Success in this direction will mean not only the saving in the direction already mentioned, but also the abolition of the expensive apparatus required by the humidification process, which has to be maintained and constantly kept in order.

The investigation to be undertaken is to be traced to two lectures delivered to the British Association of Mill Managers some years ago by Prof. W. B. Bragg, formerly of Leeds University.

Visits will be paid to works to investigate the electrification of silk, wool, cotton, and linen, and evidence will be gathered with respect to the effect on the electrification of fibres of the following conditions:—(a) Dry and wet weather; (b) east wind or south wind; (c) frost; (d) Monday morning—the effect of week-end rest, and the cooling and the drying of air. Steps will be taken to solve one fundamental point—namely, the question whether the difference between electrifiable and non-electrifiable specimens of the same species of fibre is a matter of electrical conductivity or surface structure. To settle this question it will be necessary to devise a method of measuring the conductivity of fibres. As in any case the conductivity will be very small, none of the ordinary methods will be applicable, and the deciding of this question will have an important bearing on the future course of the research. Thus the question of the effect of the nature and the quantity of the oil used for wool will depend largely on the solution of this problem. The research will have two main branches—the study of the means of getting rid of electrification, and the study of the process of "ageing" wool, with a view to shortening the time required.

Crystal Palace School of Engineering.—The Crystal Palace school has given up the premises at the foot of the South Tower, which it has occupied since it started some 40 years ago, and next term will be at a new home on Anerley Hill, close by. Mr. J. W. Wilson, the principal, recently stated that something like 2,000 students had passed through the school; more than 200 were on the roll of honour, and four had gained the Military Cross.

Appointments Vacant.—Electrical engineer and fitter (£35 +), for the Abbridge Union; telegraph foreman (£250), for the Government of the Gold Coast; junior shift engineer (£104), for the Birmingham Corporation electricity department; assistant (£58), for the motor and meter department of the Heywood Corporation electricity department; temporary chief clerk (£140), for the Aberdare U.D.C. electricity and tramways department. See advertisement pages to-day.

Volunteer Notes.—ENGINEERING INSTITUTIONS' V.E.C.
—Orders for week commencing April 17th, 1916.—By Lieut.-Col. Clay, V.D., Commanding.

Drills, 6.25 to 7.25; 7.25 to 8.25 p.m.

Monday, April 17th.—Sections 1 and 2, Technical; Sections 3 and 4, Squad and Platoon, Signalling Class.

Tuesday, April 18th.—6 to 7 p.m., School of Arms; 7.15 to 8.15 p.m., Recruit Drill.

Friday }
Saturday } Easter Training.
Sunday }
Monday }

E. G. FLEMING,

Company Commander and Acting Adjutant.

3RD BATT. (OLD BORDS) CENTRAL LONDON VOLUNTEER REGIMENT.—Battalion Orders by Capt. R. J. C. Eastwood (Commandant), Thursday, April 13th, 1916.—

Battalion Parade—Saturday.—Field Day. The Battalion will Parade outside Baker Street Station at 2.15 p.m., and proceed by train to Wembley Park, for Field Operations with the Corps of Citizens Battalion and other units. Operations will cease about 6.30 p.m.

Sunday.—The Battalion will Parade at Liverpool Street Station (low level entrance, G.E.R.), at 9.30 a.m., and proceed by train for Entrenching duties. The Battalion will return to town about 6 p.m.

Easter Holidays.—The Battalion will proceed for Entrenching duties on Saturday and Easter Monday.

Musketry.—The Ranges at Bisleigh and Acton will not be open on Saturday and Sunday next, the 15th and 16th inst.

A. G. JOINER, Major and Adjutant, O.B.C.

For Sale.—The Port Talbot Railway and Docks Co. has for disposal two sets of 44-kw. Belliss engines and Crompton dynamo, and two sets of 36-kw. Scott & Mountain engines and dynamos. See advertisement pages to-day.

Electrometallurgy in Spain.—The engineer Domingo de Ornetá, who is the discoverer of valuable deposits of chrome, nickel, and ferric ores in the Serranía de Ronda, gave an exposition recently before the Sociedad Malagueña de Ciencias of the measures he proposes to adopt for the electric smelting of the ores. Water power for the generation of electrical energy is available, and there are suitable sites for ironworks in the neighbourhood of the deposits. King Alfonso, in an interview granted in November last, conferred on Señor Ornetá a concession for a complete scheme for the manufacture of ferro-chrome and ferro-nickel. Platinum obtained from these deposits is likewise the subject of present investigations.

An Electrician's Default.—At the Belfast Munitions Court, Wm. J. Barnes, electrician, pleaded guilty to absence from work in a local engineering establishment without satisfactory reasons, and was fined 20s. The firm's representative stated that employment throughout the entire establishment was retarded by bad timekeeping in the electricity department.

Fatality.—ROTHERHAM.—While A. Nicholls (40) was employed at the works of Messrs. Steel, Peech & Tozer, Ltd., cutting off lengths of steel with an electrically-driven saw, the saw broke, fracturing his skull and killing him. Verdict: Accidental death.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station and Tramway Officials.—A long discussion on the resignation of the Oldham tramway manager (Mr. J. W. DUGDALE) took place at the T.C. last week. The resignation was accepted at a private sitting, the minute recording it added: "That Mr. Dugdale be paid his salary for a period of four months from date, and be relieved of all further duties in connection with the department."

The Walsall Electricity Committee has agreed to pay Mr. J. D. SPARK, mains engineer, a bonus of £15 in respect of extra work performed by him up to the time the new station is working.

The Bury Corporation has increased the salary of Mr. J. G. POTTS, electricity works superintendent, from £150 to £200 per annum, and the following other increases have been granted:—Mr. E. B. PAUSEY, chief shift engineer and assistant works superintendent, from £2 15s. to £3 per week; Messrs. J. HARRIDANCE, J. W. A. RENSCHAW, and V. WALKER, shift engineers, from 50s. to 55s. per week; and Messrs. W. R. BLAND, J. STEPHEN, and H. STRONG, shift engineers, from 45s. to 50s. per week.

The Newport (Mon.) electrical engineer proposes to appoint Mr. W. H. S. CLARE, now distribution assistant, to the position of installations assistant, at £140 per annum. This fills the vacancy caused by the death of Mr. C. E. CORVELL.

The Rotherham Tramways Committee proposes increases in salaries to Mr. C. WEBSTER, chief traffic clerk, and Mr. H. JAGGER, traffic superintendent.

The Fulham Electricity Committee recommends that Mr. C. HICKS, assistant mains superintendent, be appointed assistant mains superintendent and supervisor of meters. His salary is to be increased to £160, with a maximum of £200.

General.—Mr. CLAUDE W. HILL has removed his offices to 19, Old Queen Street, Westminster, S.W.

Mr. W. C. MERCER, of the electrical department of Messrs. Vickers, Ltd., Sheffield, and later electrician-in-charge at Messrs. J. & G. Wells, Ltd., Holbrook Colliery, has been appointed electrician-in-charge to the group of collieries owned by the Nunnery Colliery Co., Ltd., Sheffield, and he desires to receive lists, &c., of cables, mining switchgear, &c., at the Nunnery Pit, Sheffield.

Sir WILLIAM CROOKES, O.M., and Lady Crookes celebrated their diamond wedding on April 10th.

Dr. EDWARD HOPKINSON is one of the members selected to go to India in connection with the inquiry of the Indian Commission on Industrial Development.

Anticipating the calling-up of his "Group," Mr. G. W. P. PAGE, A.C.G.I., A.M.I.E.E., who, for the past two years, has been chiefly engaged on publication and other technical work in the publication department of the General Electric Co., Ltd., has enlisted in the London Electrical Engineers.

Mr. H. B. ROWELL has been elected president of the North-East Coast Institution of Engineers and Shipbuilders for the 1916-1917 session.

On April 4th, at Glasgow, Lieutenant G. S. HELME, A.M.I.E.E., R.F.A., of Messrs. Kelsall & Parsons, engineers, Glasgow, was married to Miss A. C. Morton, of Barhead, Glasgow.

Roll of Honour.—Second-Lieutenant H. P. BRAMWELL, R.F.C., reported wounded with shrapnel while doing photographic work over the lines, is shortly being sent home. At the outbreak of the war he was with the B.T.H. Co.

Private FRED WORSMAN, who was formerly employed at the Bradford Corporation electricity works, has been killed whilst on active service.

Private JAMES WILKINSON, of the Manchester Regiment, who has died of wounds, was formerly with the British Westinghouse Co., at Trafford Park.

Private ERNEST BEDDING, aged 19, formerly employed by Messrs. Ferranti, Ltd., was killed during a Zeppelin raid.

Nelson Electricity and Tramways Committee has decided to place on record its appreciation of the gallantry of Corporal J. W. SMITH, a tram conductor in the employ of the department, who has been awarded the D.C.M.

Obituary.—Mr. BARNET WEATHERLEY.—The death has occurred, in his 78th year, of Mr. Barnet Weatherley, of High Street, Lewisham, S.E., for many years in business as an electrical engineer in the Borough.

NEW COMPANIES REGISTERED.

E. Powell, Ltd. (143,534).—This company was registered on April 7th, with a capital of £4,000 in £1 shares, to take over the business of an electrical engineer, motor and cable agent, and engine and gunsmith, carried on by E. Powell, the elder, at 41, High Street, Tunbridge Wells. The subscribers (with 200 shares each) are: E. Powell, sen., 41, High Street, Tunbridge Wells, engineer; P. Powell, 41, High Street, Tunbridge Wells, engineer. Private company. The number of directors is not to be less than two or more than five; the first are E. Powell, sen. (permanent), E. Powell, jun., and P. Powell. Qualification, £200. Solicitor: E. C. Frend, Tunbridge Wells. Registered by Jordan & Sons, Ltd., 116-17, Chancery Lane, W.C.

H. G. Cooper, Ltd. (143,526).—This company was registered on April 6th, with a capital of £1,000 in £1 shares, to take over the business of an electrical engineer and general office furnisher carried on by H. G. Cooper at 6, Fen Court, E.C. The subscribers (with one share each) are: H. G. Cooper, 6, Fen Court, E.C., electrical engineer and general office fitter; G. S. Edwards, 29, Plashet Road, Upton Manor, Essex. Private company. The number of directors is not to be less than two or more than five; the first are H. G. Cooper, G. S. Edwards, and Alice H. Cooper. Qualification five shares. Registered office: 6, Fen Court, E.C.

Selective Signal Co., Ltd. (143,330).—This company was registered in Dublin on April 4th, with a capital of £5,000 in £1 shares, to acquire any interests in patent rights, licences, &c. The subscribers (with one share each) are: W. J. Lyons, Royal College of Science, Dublin; G. M. Meares, Fernhill, Dundrum, Co. Dublin, solicitor; J. Lindsay, 17, Westland Row, Dublin, engineer; W. Conan, 44, Kildare Street, Dublin, merchant; F. P. Griffith, Temple Gardens, Rathmines, Dublin, engineer. Private company. The first directors are W. J. Lyons, W. Conan, F. P. Griffith, and G. M. Meares. Qualification, £50. Registered office: 17, Westland Row, Dublin.

Innovation Light Co., Ltd. (143,505).—This company was registered on April 3rd, with a capital of £2,000 in £1 shares, to carry on the business of makers and vendors of gas mantles, manufacturers of and dealers in lamps, brackets, globes, films, shades, glasses, burners, meters, galvanometers, ammeters, voltmeters, carbons, cut-outs, switches, motors, batteries, stocks, railhines, pipes, wires, and appliances used in connection with gas, electricity, &c. The subscribers (with one share each) are: J. O. Street, 2, Norfolk Street, Strand, W.C., solicitor; J. M. Avery, 2, Bridge Road, St. Margaret's, Tavistockham, clerk. Private company. The number of directors is not to be less than two or more than five; the subscribers are to appoint the first. Registered office: 146, Bishopsgate, E.C.

Baxendale Bros., Ltd. (143,544).—This company was registered on April 8th, with a capital of £5,000 in £1 shares, to take over the business of a dealer in electrical supplies carried on by W. I. Baxendale at 29, Harrington Street, Liverpool. Baxendale Bros. to carry on the same and the business of electricians, electrical and mechanical engineers, manufacturers of, dealers in, agents and contractors for electrical, mechanical,

telegraphic, telephonic, photographic, optical, and other appliances, rubber, rubber hose, tires, motor cars, motor cycles, and accessories. The company may not carry on any electrical business within 12 miles of the Manchester Town Hall, note, prior to July 8th, 1921, carry on any business competing with the plumbers' material business of Baxendale & Co., Ltd., provided that this is not to restrict the company's loan dealing in plumbers' material in a minor way as an adjunct only to its electrical business. The subscribers (with one share each) are: W. I. Baxendale, 5, Lingfield Road, West Kirby, Cheshire, dealer in electrical supplies; W. Walker, 81, Queen's Drive, Walton, Liverpool, manager (retired engineer). Private company. The number of directors is not to be less than two or more than five; the first are W. I. Baxendale (permanent managing director, with £500 per annum) and W. Walker. Solicitor: J. T. Simpson, 42, Kennedy Street, Manchester. Registered office: 29, Harrington Street, Liverpool.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Isle of Thanet Electric Tramways & Lighting Co., Ltd.—Agreement to issue debenture stock, dated March 16th, 1916, to secure £25,000, and any sums which the mortgagee may have to pay under a joint and several promissory note for £3,000; also agreement to issue debenture stock of even date to secure any sums which the mortgagee may have to pay under a joint and several promissory note for £3,000; also agreement to issue debenture stock of even date, to secure £2,500, and any sums which the mortgagee may have to pay under a joint and several promissory note for £3,000. Property charged: The company's undertaking and property, present and future. Holders: W. M. Murphy, 39, Dame Street, Dublin; A. K. Monks, 129, Cannon Street, E.C.; H. Brown, The Red House, Parkside, Wimbledon Common; and J. B. Glenn, Moorgate Station Chambers, Moorfields, E.C.

Bright's Light & Power Co., Ltd. (58,290).—Capital, £200,000 in £1 shares (100,000 paid). Return dated December 31st, 1915 (filed April 6th, 1916). All shares taken up; £1 per share called up on 66.667; £66.668 5s. paid, leaving £177 15s. in arrears; £33,333 considered as paid on the remainder. Mortgages and charges: £16,000.

City of Buenos Aires Tramways Co. (1904), Ltd. (82,214).—Capital, £1,240,000 in £1 shares. Return dated February 29th, 1916. All shares taken up and considered as fully paid. Mortgages and charges: £174,000.

United Flexible Metallic Tubing Co., Ltd.—A memorandum of satisfaction in full on March 29th, 1916, of debentures dated January 1st, 1907, securing £5,000, has been filed.

Woodbridge & District Electric Light Co., Ltd.—Issues on various dates from October 27th, 1913, to March 31st, 1916, of £1,000 debentures, parts of a series of which particulars have already been filed.

H. J. Cash & Co., Ltd. (79,701).—Capital, £10,000 in £1 shares. Return dated February 29th, 1916. All shares taken up; 17s. 6d. per share called up; £8,750 paid. Mortgages and charges: Nil.

Cambridge Electric Supply Co., Ltd. (36,457).—Capital, £100,000 in £10 shares. Return dated March 8th, 1916. 9,911 shares taken up; £9 per share called up; £89,199 paid. Mortgages and charges: £30,000 first debentures; also one debenture with bankers, to cover £15,000.

Atlas Carbon & Battery Co., Ltd. (34,857).—Capital, £2,000 in £1 shares. Return dated December 29th, 1915 (filed March 7th, 1916). All shares taken up; £8 paid; £1,992 considered as paid. Mortgages and charges: £3,000.

Electric Train Lighting Syndicate, Ltd. (112,932).—Capital, £5,200 in £1 shares. Return dated March 30th, 1916. All shares taken up; 5s. per share called up on 900; £225 paid; £4,300 considered as paid on 4,300 shares. Mortgages and charges: Nil.

Crossley Bros., Ltd. (51,970).—Capital, £973,700 in 9,339 pref. and 57,031 ord. shares of £10 each. Return dated March 9th, 1916. All shares taken up; £278,200 paid on 27,820 shares; £695,500 considered as paid on 12,519 pref. and 57,031 ord. shares. Mortgages and charges: Nil.

CITY NOTES.

British Westinghouse Electric and Manufacturing Co., Ltd.

MR. J. ANNAN BRYCE, M.P., presided on April 6th, at Hamilton House, over the annual meeting of this company. He said that sundry creditors stood at £409,000, as compared with £265,000, the increase being due to the larger scale of the business. There was an increase of £5,000 in the reserve for employer's liability, which the board considered advisable in view of the abnormal conditions existing at the works, arising out of the extra pressure at which they were operated, the large amount of female labour employed, and the inexperience of the fresh labour from which they had had to recruit their forces. The balance of £44,632 carried forward was an increase of £26,511 over last year, and it was necessary in view of the legislation of last session. As the nature of the excess profit tax was not even now generally understood, he referred to this at some length. It was imposed largely in deference to the demand of workmen that their labour should not be exploited by manufacturers making exceptional profits through war conditions. If the tax had been imposed solely on profits due to the war no exception could have been taken, but it speedily appeared that it would have been difficult, if not impossible, to distinguish profits arising from the war from profits made during the war. Naturally, the Treasury chose the course which not only was simpler, but brought a great deal more grist to its mill, and, accordingly, the tax was imposed on all businesses which had made more

profit during the war than before it. But it was unfair in all cases where a business was in a state of development, and where the larger profits in the year 1914 had no necessary connection with the war, and where, indeed, in many cases they would have been still larger but for the war. This was pre-eminently their own case. The war began on August 4th, 1914, and their accounts were closed on December 31st, 1914. They had, therefore, in their accounts only five months of the war, during the first of which business was almost paralysed, and during the last four of which it was exceedingly difficult to conduct owing to the loss of much of their skilled labour, partly by recruiting and partly from the sudden demands of the Government factories which, by enormous wages, tempted away many of their best men. Moreover, during the last four months of 1914, not only labour, but materials advanced in price, so that their costs were higher than estimated. Furthermore, in a business like theirs, the profits were not realised till long after the order was taken, and it might be said that none of their profits in the year 1914 were due to orders taken during the war months of that year, or even to orders taken in the pre-war months of that year. From all the above considerations they would see that not only were their larger profits of 1914, as compared with previous years, not due in any sense to the war, but were actually smaller than they would have been had there been no war. Yet they were called upon to pay to the Government half of the excess profits of 1914 over those of two out of the three pre-war years, 1911, 1912, and 1913, merely because, as the result of hard thought and hard work, their profits happened to be on an ascending scale, while other concerns which had reached their development sooner, were, though making far larger profits than themselves, entirely exempt from the tax. Surely, nothing more unfair could be imagined; yet the Chancellor turned a deaf ear to every argument, and in the Budget introduced two days ago he proposed to increase the injustice still further by raising the tax from 50 per cent. to 60 per cent. In August, 1915, they became a "controlled establishment" under the Munitions of War Act, 1915, and were consequently, as regarded the accounts for the year 1915, liable to a levy of 80 per cent. of their excess profits. How the taxing provisions of these two Acts would work out in practice had not yet been ascertained, as the basis of calculation was not quite the same, but the Chancellor of the Exchequer had announced in his Budget speech that he was determined to make the best of both worlds, and would levy the taxation under whichever Act gave the best return to the Treasury. The ordinary income-tax had within the last two days been raised from 3s. 6d. to 5s., and how much further it would go would depend on the duration of the war. Had the report been delayed until after the Budget, he was by no means sure that the directors would not have decided on a still greater provision. On the credit side of the balance sheet, stock and material on hand £1,098,000, showed a large increase on last year's figures of £759,000, but that and the increase of £128,000 in "sundry debtors" was accounted for mainly by the increased scale of the business, and partly by their having to work as a controlled establishment. Shares and debentures in other companies stood at about the same figure, but there had been an exchange of shares with their American friends who had parted with their holding in the French Co. in return for shares in the Traction & Power Securities and Clyde Valley Companies. In the profit and loss account, the net profit was £176,752, against £151,627, an increase of £25,125. It was not so large an increase as was shown in 1914 over 1913, but, under the circumstances, could be considered satisfactory. With regard to the business generally during 1915, their total orders received compared with those of 1914 showed an increase over the latter year of about 73 per cent., but this included one large single order for the electrification of an important railway amounting to about £500,000, to which there was no corresponding order in 1914, and certain war munitions work. After eliminating these two items, the general orders still showed an increase over 1914 of some 30 per cent. A considerable part of this increase was probably due to the absence of German competition, from which they had suffered so much in the past. They must hope that when peace was come, this competition would be scotched for some time to come. Mr. Lloyd George was doubtless actuated by Christian principles when, in a speech the other day, he deprecated the introduction of revenge into the business, but, with human nature as it was, it would be surprising if the nations who had suffered from German barbarism were content to kiss and be friends, receiving Germany back into the comity of nations as if nothing had happened. And revenge apart, did not the policy of "kiss and be friends" simply mean that they would again lay themselves open to that unscrupulous penetration, as a step to domination, from which all the world has so long been suffering? The Commonwealth of Australia, under the bold leadership of Mr. Hughes, had already shown that she did not mean to run any such risk, and perhaps Mr. Asquith, during his journeyings, might have learned something of the intentions of their Southern Allies. Those who knew what was going on to-day in France were aware that she, at least, was determined in the future to allow no penetration, however peaceful. Both their domestic and Continental orders showed a good increase, but, as was only natural, having regard to prevailing conditions, their export sales showed some falling off. It was interesting to

note that, notwithstanding the changed conditions at their works, they had had the minimum of friction with their workpeople, and, generally speaking, the most wholehearted assistance; and much credit was due to the tactful manner in which those in charge had dealt with the many difficult problems presented by present conditions. At the outbreak of the war they had on their hourly pay rolls 4,720 men and 513 women, = 5,233 total, while at the present time they had 5,504 men and 1,344 women, = 6,848 total. The Chairman next dealt with the war relief fund inaugurated by the staff to assist the dependents of men called to the Colours, and said the employes had raised £13,643, to which the board added £6,231. The number of men who had joined the Forces was approximately 2,000, and of these 70 had been killed in action and many grievously wounded. In addition to this, some 3,500 men had attested under Lord Derby's scheme. Their school for the instruction of apprentices had grown considerably. Whereas on January 1st, 1914, they had 100 apprentices, of whom 30 attended school, on January 1st, 1916, they had 330 apprentices, of whom the whole number attended school, in addition to which 120 had joined the Colours; and they were particularly pleased to state that the class of boy now attracted to the works was greatly superior to that in former years. Twenty-three of their foremen were giving lectures, numbering in all nearly 100 in the course of the year, and the co-operation between school and shops was improving all the time. They had also inaugurated classes for girls engaged in the drawing offices, and were preparing a class for girl meter testers. The work of the school was attracting great interest on account of its novel nature. Four of the chief inspectors of the Board of Education had visited the school and discussed very fully the lines on which it was conducted, and Mr. Fleming had had several conferences with leading officials of the Board on the system pursued. Inquiries with regard to their methods had been received from many public bodies, companies, and private firms, and the fame of their system having spread, numerous applications for apprenticeships were coming from all parts of the country. Altogether, the school seemed to be doing a valuable pioneer work, and the greatest credit was due to Mr. Fleming, the superintendent of the transformer department, who had initiated and developed the scheme, and to those who had co-operated with him. Let them pay the devil his due. The efficiency of Germany, everyone must admit, was mainly due to the development of such methods of technical training, in which, unhappily, England had till now lagged behind. He did not believe in being too optimistic, neither did he desire to go to the other extreme, but they must all appreciate the trying times through which they were now passing, and, while their accounts showed that they had still further progressed over those of last year, there were indications that they might be still further taxed in order to help towards the heavy expenditure due to this devastating war, and further difficulties might be placed in the way of carrying on their normal business. Orders were still coming in well, and at the moment were slightly in excess of those at the corresponding period of last year, but it must be remembered that the large railway order in 1915, to which he had alluded above, was an exceptional one. Last year he discussed the destruction of capital likely to be caused by the war, and hazarded an estimate of 5,000 million pounds. That estimate to-day appeared absurdly moderate. Certainly they must look to a diminished purchasing power in the world, and a consequent depression in industry, but that depression would probably not show itself immediately after the war ended, and he still held to the view that even when it did come it might not affect, at least at first, industries such as theirs, which were necessary for the purposes of reconstruction and the economical working of other industries, especially as in their particular business the pressure of German competition was not likely to be so severe. It was partly due to their anticipation of post-war conditions that, with a view to broadening the basis of their business, they acquired the controlling interest in the French company. In France, as in England, German competition was before the war exceedingly keen, while after the war it was even less likely to be felt than here. The Italian company, in which they held through the French company a controlling interest, was also fully employed, mainly on munitions work, but here, also, the post-war prospects were good. The use of electrical apparatus, both for railway and other purposes, appeared likely to increase largely, while in Italy also a diminution of German competition appeared probable, though perhaps not to so great an extent as in France.

Mr. N. B. DICKSON seconded the motion.

Mr. TOMKINSON did not think Mr. Lloyd George intended they should kiss and be friends, and thought that it would be detrimental for such a statement to go out from that meeting.

Mr. ACLAND emphasised the injustice done to shareholders in the company, who had received no return for years, by the imposition of the excess profits tax. He suggested that they might protest to the Government, and say they would close their factory against Government orders.

Mr. BIRKS thought the shareholders would have something to say with regard to closing the factory. He saw no reason for the Chairman speaking in a minor key.

The CHAIRMAN said the interpretation put on Mr. Lloyd George's speech was not his, but that put on it by the Press. He had been a Free Trader all his life, and went into Parlia-

ment ten years ago to defend Free Trade. In a proper ideal state of affairs he was still a Free Trader, but could anyone go and sack hands with a man who had been robbing and violating and slaughtering all over the world? He did not feel he could do that, and, after all, nations were made up of individuals. He did not feel that this country, and still more France, Belgium, and Russia, would "kiss and be friends" with Germany after the war. If the Germans in the course of years became civilised, if they became entirely regenerated and changed their whole view of life, it might be possible to be friends with them. He had already urged the injustice of the excess profits tax in the case of a company like theirs, but he had not the slightest hope of convincing the Chancellor of the Exchequer.

The report was then adopted. A hearty vote of thanks to the staff was carried.

German Electrical Companies.

The Voigt & Haefliger A.G., of Frankfurt-on-Main, proposes to distribute 12 per cent. for 1915, as contrasted with 8 per cent. in the preceding year.

The Dr. Paul Meyer A.G., of Berlin, which company makes switch apparatus, and closed the year 1914 with a deficit of £10,000, intends to pay a dividend of 7½ per cent. for 1915.

The report of the *Norddeutsche Kabelwerke A.G., of Neu-kolln*, which company was formed about a year and a half ago under the heading of the *Mix & Genest Co.* to acquire an undertaking having the same title, states that the results achieved in the year ended with September 30th, 1915, corresponded to expectations. The gross profits total £12,700, and the net profits £6,500, and a dividend at the rate of 8 per cent. has been declared.

The report of the *Deutsche Kabelwerke, of Berlin-Lichten-berg*, states that the company was satisfactorily occupied during 1915. Including the balance brought forward, the gross profits amounted to £73,000, as against £98,000 in 1914, but on this occasion the profits have been arrived at after making reserve provision for outstanding debts, investments, &c. After deducting general expenses, &c., and appropriating £1,500 for depreciation—all other accounts are already written off—the accounts exhibit net profits of £55,000, as compared with £32,000 in 1914. The dividend proposed is 6 per cent., as in the preceding year.

The Sachsenwerk Licht und Kraft A.G., of Niedersiedlitz—the former Kummer works—reports that ordinary requirements in electrical manufactures existed in 1915, principally for various authorities and large industrial works. The change over for the production of war material which was begun in 1914 was continued last year, and the total turnover exceeded £1,500,000. As gross profits, the accounts show the sum of £209,000, as compared with £66,000, and net profits of £184,000 and £47,000 in the two years respectively. The directors propose a dividend of 18 per cent. on the ordinary capital of £225,000, as compared with 8 per cent. in 1914.

Swiss Electrical Companies.

The accounts of the *Aluminium Industrie A.G., of Neuchâten*, show net profits, including £14,000 brought forward, amounting to £379,000 for 1915, as compared with £280,000 in the preceding year. After allocating £140,000 to the fund for the gradual payment in full of the share capital, which at present is paid up to the extent of 60 per cent., it is proposed to distribute 20 per cent. on the paid share capital, being the same rate as in 1914.

The Société d'Exploitation des Câbles Electriques, of Cor-tailloil, reports gross profits of £10,000 for 1915, as contrasted with £6,900 in 1914. The amount set aside for depreciation is £3,500, as against £2,900, and the net profits and balance forward are returned at £10,900, as compared with £9,500 in the preceding year. It is intended to pay a dividend of 30 per cent. on the share capital of £20,000, the rate in 1914 having been 25 per cent.

The Schweiz. Gesellschaft für Elektrische Industrie, of Basle, which is an investment company associated with the Basle Handelsbank and the Siemens & Halske group, records gross profits of £173,000 for 1915, as against £193,000 in the previous year. After meeting interest on the loans totalling £2,000,000, and making various appropriations, the accounts indicate net profits of £49,000, as compared with £69,000, and the directors recommend a dividend of 5 per cent. on the share capital of £800,000, this contrasting with 7 per cent. in 1914. The undertakings in which the company is interested continued favourably to develop, with few exceptions, in the past year, but no new transactions were embarked upon.

Folkestone Electricity Supply Co., Ltd.

The annual meeting was held on March 31st. **MR. G. SPURGEN** said that, considering the abnormal circumstances under which the company had been working during the past year, the financial results were in every way satisfactory. The restricted lighting orders had necessarily affected to some extent the revenue receipts from private users and for public lighting. Substantial allowances had been made to the municipal authorities concerned. Capital expenditure during the year was £2,689. The all-round advances in the prices of materials and other costs were responsible for increased costs

of production. Coal was the principal item, and their contract having expired they were obliged to enter into a fresh one at prices very considerably advanced. The gross profits amounted to £16,758, and although these figures were less than the corresponding amount of 1914, they were consoled by the fact that they had a larger amount to deal with as brought forward, and much less provision to make for the special items of depreciation. After payment of the usual debenture interest and preference dividend, they were able to maintain the same dividend on the ordinary shares (7 per cent.) as last year, to place £5,000 to the depreciation fund, £500 to the reserve, and to carry forward £2,092. During the year 233,115 units were generated, and 1,754,370 were sold. There were 116 new consumers, with an equivalent of 7,508 s.c.p. lamps. So far 22 men had joined the Imperial Forces, and half wages, amounting to £735, had been paid.

Cleveland, Portishead and District Electric Supply Co., Ltd.

The directors report a very satisfactory growth of the undertaking, the gross revenue for 1915 being almost exactly double that of 1914. The consumers connected to the mains in Portishead had increased from 130 to 179, and the new sub-station at Bower Ashton, now complete, had been supplying the South Liberty Colliery since Michaelmas. Further motors were now being put down at that colliery. The total revenue was £1,737, as against £887, and the gross profit was £696, against £444. The net profit was £487 (against £343), plus £72 brought forward. After paying 6 per cent. on the preference and 2½ per cent. on the ordinary shares, £150 was put to depreciation fund, £100 was put to writing down preliminary expenses, and £37 was carried forward. Units sold were 209,524, as against 56,096 in 1914. A further issue of 6 per cent. preference shares is being offered to holders, for extension purposes. The board thanks Messrs. Christy Bros., Ltd. for advancing (at 5 per cent. and without any security) the sums necessary to complete several very lucrative extensions. The Board of Trade is considering the company's application for leave to extend the mains through the village of Long Ashton.

Urban Electric Supply Co., Ltd.

For 1915 the gross profit was £68,513, as against £68,962, and after deducting expenses the balance was £65,512. Interest and debenture stock redemption absorb £43,423, leaving £21,889, which is applied thus:—5 per cent. dividend on preference shares, £12,500; to reserve for depreciation, £9,389. Annual meeting: Yesterday. The following comparative table shows the equivalent in 33-watt lamps connected, also the profits:—

	Lamps.			Profits.

Altrincham Electric Supply, Ltd.

During 1915, 76 new installations were connected to the mains, and the number of consumers is now 1,632. £1,059 new capital was expended. After providing for debenture interest, premium on debenture redemption policy, legal expenses, &c., the profit was £5,578, plus £1,567 brought forward, making £7,145. The dividend on the preference shares is paid, £500 is transferred to general reserve, and £1,500 to reserve for depreciation of plant, leaving £4,016 to be carried forward, out of which a dividend of 7s. 6d. per share is to be paid on the deferred shares, absorbing £2,625. The units sold were 1,676,081; units generated 2,059,855.

Brush Electrical Engineering Co., Ltd.

The report for the year 1915 states that the volume of output has been maintained, but high wages, the shortage of skilled labour, and heavy increases in the cost of fuel and materials have all tended to offset the improvement that would otherwise have been apparent in the net earnings. After providing for general charges, maintenance of plant and buildings, and interest on debenture stocks and loans, there remains £17,300, and £7,065 was brought in, making £24,365. The directors recommend that £8,000 be applied for depreciation of property, patents, and goodwill, £2,044 in payment of the further 4 per cent. interest to which holders of the 6 per cent. prior lien participating second debenture stock are entitled out of the first net profits available for dividend in any year, and £5,000 placed to reserve, carrying forward £9,321. £31,963 has been expended on capital account during the year, and the directors have not yet issued the balance of the 6 per cent. prior lien participating second debenture stock referred to in the last report, for the issue of which consent of the Treasury has been obtained.—*Financial News*.

Cork Electric Tramways and Lighting Co., Ltd.

The revenue for 1915 was £63,905, and the expenses were £12,415, leaving £21,490, plus £2,480 brought forward. Interest on debentures requires £1,600; 5 per cent. preference dividend £6,163; there is added to reserve for depreciation and renewals £6,500; £1,776 is to be written off wiring consumers' premises, repair shop equipment, plants on loan, &c.; £890 written off investments; and £4,041 is to be carried forward. Lighting and power business continues to show satisfactory progress, agreements for 147 connections being made, the additional connections amounting to 405 k.w., as against 467 k.w. in 1914. The revenue increased by £2,301, and the expenses by £4,457, due to high price of coal, war bonuses and allowances. The net revenue shows a material reduction in consequence, and no dividend on the ordinary shares is possible, as it is necessary to carry forward a larger sum than usual to provide against further increases in coal and other materials. Owing to the increase in expenses, the lighting and power tariff was raised from July 1st last, but the additional charges to the consumers represents a very small percentage of the increased cost of operating: £1,663 was spent on capital account, mainly for house services and cables, during the year. The 1,250-k.w. Curtis turbine will be delivered shortly. Annual meeting: April 19th.

Passengers carried 5,899,003, as against 5,858,904 in 1914; car mileage 670,004, as against 632,227; lighting and power customers 2,973, as against 2,826; S.C.P. lamps, 200,030, as against 186,477.

Woking Electric Supply Co., Ltd.—Mr. J. Ashby presided at the annual meeting, and, in referring to the large amount set aside to depreciation and renewals fund and to reserve account, he said that the company was not affected to any material extent by the war, but they could not say what might happen. The cost of coal had increased by £205 (6 per cent.), but they had sold 31,841 more units. It was largely due to the efforts of Mr. Bowden that they had reduced the coal consumption per unit. The increase in sales was largely due to the extra number of cookers sold during the year, there having been a great demand for cookers and heating apparatus.

Wycombe (Borough) Electric Light and Power Co., Ltd.—The connections increased during 1915 by 137 kw. to 3,392 kw. Including £184 brought forward, there is a net profit of £7,066, and after paying interest on debentures and outstanding accounts amounting to £3,263, £3,802 is available. A dividend of 2½ per cent. absorbs £1,000, £2,000 is to be placed to the reserve fund for renewal account, leaving £802 to be carried forward.

Lynton Electric Light & Power Co., Ltd.—Including £697 brought forward, there is a net profit of £2,447, and after paying debenture interest £450, and income-tax £112, £800 is placed to reserve, 5 per cent. dividend is paid on the preference shares, and £764 is to be carried forward. During the year £1,512 was invested in Colonial Government stock and War Loan.

Western Union Telegraph Co.—The *Times* New York correspondent states that this company reports for 1915 gross operating revenues of \$51,171,795; operating expenses and taxes, \$10,199,254; income from investments, \$1,303,926. Interest charges amounted to \$1,835,589, and the balance available for dividends is \$18,531,921. The surplus, after providing for dividends, is \$8,545,557. The total accumulated surplus is \$18,882,969.

Yorkshire (Woollen District) Electric Tramways, Ltd.—A dividend of 4½ per cent. on the ordinary shares is to be paid for 1915, and £2,943 is to be carried forward. The revenue increased from £65,385 to £71,513.

Western Telegraph Co., Ltd.—Should the present net revenue be maintained, the directors will recommend at the general meeting a bonus of 2 per cent., which, together with the ordinary dividend of 6 per cent., will make a total of 8 per cent., free of income-tax, for the year.

Eastern Telegraph Co., Ltd.—A final dividend of £2 5s. per cent., and a bonus of 2 per cent., both free of tax, making a total of 8 per cent. for the year on the ordinary stock, are announced.

Eastern Extension, Australasia and China Telegraph Co., Ltd.—A final dividend of 4s. 6d. per share is announced, together with a bonus of 4s. 6d. per share, both free of tax, making a total of 8 per cent. for the year.

Lancashire Dynamo & Motor Co., Ltd.—The *Financial Times* says that from various causes the balance sheet cannot be issued until some weeks later than usual, and the directors have, therefore, decided to pay a further interim dividend of 4½ per cent., free of tax.

Direct United States Cable Co., Ltd.—A final dividend of 2s. per share, less income-tax at 3s. 2d. in the £, making the total for the year 4 per cent., is announced.

Kalgoorlie Electric Power & Lighting Corporation, Ltd.—A dividend at the rate of 4 per cent. per annum for the past half-year has been declared.

Bombay Telephone Co., Ltd.—An Indian exchange states that this company proposes to increase its capital to Rs. 20,00,000 by the creation of 41,000 new shares of Rs. 25 each.

Sao Paulo Tramways, Light & Power Co.—A dividend of 2½ per cent. on the issued common stock is announced.

Rio de Janeiro Tramway, Light & Power Co.—A dividend of 1½ per cent. on the issued capital stock is announced.

STOCKS AND SHARES.

TUESDAY EVENING.

The effects of the Budget are beginning to be felt in the Stock Exchange markets, and certain of the purely investment sections show some slight heaviness in tone. On the other hand, the imposition of heavier income-tax is making investors eager for such stocks and shares as those upon which the dividends are paid free of tax. In our lists there are various examples to be found in the telegraph market; while, in the Home Railway list, Underground Electric income bonds fall into the same category.

Generally speaking, business throughout the House is not at all bad, and the way in which the attractions of Exchequer Bonds are being re-advertised suggests that the Treasury may postpone, for some time to come yet, the issue of another War Loan. This consideration counteracts in no small degree the full effect of the 5s. income-tax; and investment has been resumed on behalf of the people in the Midlands and the North who are making money out of the various industries connected with the war.

Underground Electric incomes have risen 3 points to 86, and the shares are better at 1½, while, sympathetically, the shilling shares improved to 6s. Another dramatic feature is a rise, also of 3 points, in Districts, this taking the price to 19½. Dealers in the market are at a loss to account for the buying, but the surmise is that some American group has taken the stocks in hand—or, rather, has tried to do so. Perhaps a more natural explanation lies in the limited character of the market. A demand for £5,000 District stock—which, after all, would involve less than £1,000 money—is quite sufficient nowadays to move the price a couple of points or more. Metropolitan went up 1½, and there has been rather more demand for South Western deferred, upon renewal of the statement that the company is doing well with its electrified system.

The Telegraph market shows the principal movements. As we have pointed out on several previous occasions, there is not much floating stock, beyond that which became available through deceased accounts; and the greater part of this was taken towards the end of last week. Good rises have occurred in Eastern Telegraph ordinary stock, Eastern Extension, and Western Telegraph shares. Globe ordinary gained 7s. 6d. That it is the matter of income-tax which is the principal attraction is obvious from the fact that the stocks of the Anglo-American and other companies which pay their dividends less tax have hardly participated—at any rate, up to the present—in the strength of the lists. The only exception is Great Northern Telegraphs, which are 4½ higher.

Manufacturing shares are good. British Insulated are up 2s. 6d., Telegraph Constructions 4½, Henleys 5½, British Westinghouse preference 1s. 3d., and Electric Constructions 6d. Several of the others which exhibit no quotable change are difficult to buy at anything like the nominal prices. General Electric preference fell 5s. to 9½, and this is the only exception to the firmness of the market as a whole.

Electricity Supply prices keep somewhat irregular. The market is certainly getting into a healthier condition, and buyers are on the *qui vive* for cheap shares. The attention of these purchasers turns this week to the ordinary shares of the City, the County, and Westminster Companies. Cheesmans have eased off, with Brompton and Kensington. All the companies in this department pay their dividends less tax.

More favourable attention is being directed to Mexico. The stocks of the railway companies operating in the country are in some request, and there has been a little inquiry for the bonds of the utility concerns. Mexican Light & Power bonds are better, but Mexican Tramways are not quotably altered, though it is more difficult to get the offer of them than it was a week or a fortnight ago. The unexpected reappearance of Felix Diaz, the son of the old President, has reinforced the wavering hope that order will ever be restored in Mexico, although it is far from clear as to what recognition he will receive from the United States, committed, as they apparently were, to uphold the claims of Carranza.

Brazilian securities are also a little more popular, though Brazilian Tractions, after being 5½, reacted to 5¼. The Argentine descriptions remain tolerably steady, but investors are a little cautious about the Argentine Republic at the present time, having regard to the unfavourable news with reference to the maize crop and the distinctly unpleasant nature of the traffic receipts on the various railways.

Canadian and American utilities are mostly good. The sensational rise in City Services common shares took the price up to within a point or so of 200, from which it fell back to 190 on sales by those who had got in early, when the rumours were first circulated as to the company's having discovered oil on its property. British Columbia Electric preferred and deferred stocks are both a point down, although the 4½ per cent. debenture hardened to 62.

Interest in Marconi stands arrested for the time being, awaiting a more definite statement from the Government as to what the company will receive for the use of its system. The United States has bought a few American Marconis, but the price has not improved to any noticeable extent; and Canadians loiter in the neighbourhood of 7s. 6d.

Armament shares are mostly better, thanks to the declaration by Armstrongs of a good dividend. The rubber market, too, is good, although business has fallen off fairly substan-

tially from what it was a fortnight ago. The shrinkage of business, however, has not brought about profit-taking to the extent that it usually does in such cases.

Telegraph Works Co., Ltd.	r W. F. Dennis & Co.

Holsworthy Gas & Electric Supply Co., Ltd.—Mr. J. Mc T. DICKSON, presiding at the annual meeting, said that the stand-by plant for the electricity undertaking, which had been contemplated ever since the inauguration of the company, was about to be installed at a cost of between £400 and £500, which would be raised by 5 per cent. second debenture stock shares. The receipts from sale of electricity amounted to £296 during 1915, and from gas £1,086.

Isle of Wight Electric Light & Power Co., Ltd.—The accounts for 1915 show a profit, including £2,741 brought in, of £12,867. After providing for interest and sinking fund on debentures and the 5 per cent. preference dividend, the directors transferred £3,500 to the renewal fund and carried £1,367 forward.—*Financial News*.

International Lighting Association.—For 1915 the net profit was £1,505. After paying the preference dividend, 5 1/2 per cent. for the year, £451 is to be carried forward.

Cambridge Electric Supply Co., Ltd.—The profit for 1915, including £2,647 brought forward, was £12,006. After placing £2,000 to depreciation account, and paying 5 per cent. dividend, £2,753 is to be carried forward.

Winnipeg Electric Railway Co.—The *Financial Times* states that the net earnings for 1915 were £1,331,737, as compared with £1,685,093 for the previous year. After providing for fixed charges and dividends amounting to 9 1/2 per cent., the net result was a deficiency of £388,898, reducing the credit balance brought forward to £782,598.

Oriental Telephone & Electric Co., Ltd.—A dividend on the preference shares at the rate of 6 per cent. per annum for the last half of 1915, less income-tax, is announced, also a final dividend of 6 per cent. on the ordinary shares, free of income-tax, making a total of 10 per cent. for the year.

City of Oxford Electric Co., Ltd.—After paying a dividend of 4 1/2 per cent., £355 is transferred to reserve and £1,563 is carried forward.

Monte Video Telephone Co., Ltd.—An interim dividend at the rate of 6 per cent. per annum for the half-year, less tax, is announced.

Leamington and Warwick Electrical Co., Ltd.—After paying 5 per cent. dividend, £1,833 is to be carried forward.

SWITCHBOARDS IN THE MAKING.

ALTHOUGH the standardisation of electrical apparatus and plant has made considerable progress in late years, yet in certain directions considerable variation in arrangement or design is still practically a necessary feature.

THE NEW DRAWING OFFICE.

The average switch-board is a typical example, in which the numerous combinations of measuring instruments, protective devices and controlling apparatus for plant of varying type and size almost always entails a special design to suit the particular conditions.

In fact, such are the peculiarities of this class of work, that large firms may find it desirable to leave the unstandardised portion to smaller organisations, while they concentrate their attention on the standard switches, instruments, &c., used in the construction of such boards. Another factor bearing on this arrangement is the frequency with which engineers specify particular makes of apparatus to be mounted on the boards, with the result that one firm's standard products cannot always be adopted.

The conditions referred to above led Messrs. Ferguson, Pailin & Co., Ltd., about 2½ years ago, to commence a specialist business in switchboard building at Higher Openshaw, Manchester, the principals having already had extensive experience in this class of work with well-known firms. The firm confines itself to the assembly and connecting up of proven apparatus made by reputable firms, and such has been the demand for its switchboards, that the firm has recently been compelled to extend its premises to cope with it. Our views show a new erecting shop and extended drawing office at the works; the former shop allows for three rows of switchboards being in progress at the same time, and, the building being lofty, enables one board, when complete, to

be lifted over the others for removal for packing, &c. Each board is erected on channel bases fixed in the floor, while wall stays are provided attached to adjustable brackets. Every switchboard is assembled complete to ensure accuracy of finish, and for packing as little as possible of the gear is dismantled.

A special machine has been developed for bending the heavy copper interconnections required between pieces of apparatus.

The design of switchboards is a very considerable factor in the manufacture; each board is set out in detail, the general disposition of interconnections being determined, and complete records are kept in view of possible extensions being required.

The range of manufactures dealt with comprises all classes of flat-back boards for alternating and direct-current work, mechanically and electrically remote controlled boards for heavy plants, high tension cubicles, interlocked, and non-interlocked for sub stations, neutral point earthing resistances, &c.; heavy-power switchboards have been manufactured for plant of 30,000 volts and 15,000 amperes, and it is of some interest to record that the average yearly output of switchboards will control some 81,000 H.P. of plant, the apparatus having been supplied to 23 municipal electrical departments and many industrial firms, both at home and abroad.

EXTENSION TO THE SWITCHBOARD ERECTING SHOP, MESSRS. FERGUSON, PAILIN'S WORKS

Chemistry at University College.

—A series of new chemical laboratories and research rooms has been erected at University College, Gower Street, which is said to be the finest in the kingdom, and unsurpassed upon the Continent. A sum of £20,000 is required to complete the equipment, of which £14,000 is urgently needed, and the treasurer, Capt. the Hon. Rupert Guinness, M.P., will be glad to receive contributions for this purpose at the College. In view of the immense importance of chemical research to this country, we cordially commend this appeal to our readers.

SWITCHBOARD SUPPLIED BY MESSRS. FERGUSON, PAILIN & CO. FOR A GLASGOW SUB-STATION.

THE HIRE AND MAINTENANCE OF CONTINUOUS-CURRENT MOTORS.

ON APRIL 3rd the WESTERN LOCAL SECTION of the INSTITUTION of ELECTRICAL ENGINEERS discussed Mr. H. JOSEPH's paper on this subject, of which an abstract appeared in our last issue.

Mr. H. FARADAY PROCTOR said he noticed that the cost of maintenance had increased from 2 per cent. in 1903 to 6.2 per cent. in 1915, and that the author expressed his opinion that it had now just about found its level. He thought the cost of maintenance of large motors would prove to be less than the maintenance of small machines, and would depend on the class of parts supplied, and the number of breakdowns, rather than on the cost of repairing the breakdown. The author said he never disputed liability in the event of a breakdown; this was a point they considered very carefully when they were contemplating the hiring of motors in Bristol. They were afraid that if they undertook the maintenance of the motors it might lead to carelessness on the part of customers' employees. In Bristol, they only let motors out on simple hire, but a customer might take over the motor at an agreed depreciation at any time he pleased. He had often noticed that a man would hire a motor in the first instance, and directly he had proved that the equipment was to his satisfaction he would buy it.

Mr. E. G. ORELL asked whether the author placed any limit on the size of the motor, and the character of the maintenance that was most expensive.

Mr. P. F. CRINKS thought that a totally-enclosed motor would make a more satisfactory—and probably a cheaper—arrangement for a damp situation than placing the motor outside the building.

Mr. A. C. McWHIRTER, referring to the equipment of the workshop, considered that a stove with which to dry out the machines was a very essential item. Regarding soldered connections, he entirely disagreed with the author, as his firm did a great deal of soldering, and never got any trouble, unless it was due to careless workmanship. He thought many people under-cut the mica to too great an extent. Regarding the rewinding of armatures, his experience was that a tremendous amount of labour was wasted in using old material, which probably broke down immediately the motor was put to work. In certain cases, he considered ball-bearings very desirable, especially at the commutator end, although he agreed that a roller bearing constituted the best arrangement in most instances. He thought periodical and systematic inspection the best arrangement for maintenance jobs.

Dr. D. ROBERTSON agreed with the author regarding the want of a really good starter. Recently he ordered a starter from a firm of good repute, and, although the resistance coils were very nicely built up, the frame on which they were mounted was much too light, and after a little time a number of short-circuits were caused owing to vibration. His experience was that, not infrequently, the starting gear was just as expensive as the motor itself.

Mr. JOSEPH, in replying, said that the arrangement he had adopted was to keep the cost of materials for motor repairs in a "motor repairs account," and not in a separate account of the repairs to each different size of motor. The smaller motors did cost more, in proportion, to repair than the larger ones. With regard to the question of liability in the event of a breakdown, they knew there was a certain amount of risk that a man might badly treat the motor, but they were prepared to take this risk in the same way as an insurance company had to take risks. He found that the motors were as well cared for since they had done the maintenance in the days when they only did the simple hire. They endeavoured to get the owner to appoint one man to look after the motors in a particular department, and to make that man responsible for them. The man knew that if the motor broke down, the mill, or the section of the mill, would be stopped, and his desire to prevent such a thing happening was usually sufficient inducement to make him endeavour to prevent a breakdown occurring, either by neglect or carelessness. The maintenance factor that was most expensive was the labour involved. One man spent nearly all his time on repair work, and, when necessary, others were called off other jobs to give assistance, and the cost of their time was properly allocated to the work they actually did. He thought labour represented 75 per cent. of the cost of maintenance, especially now that they were doing their own rewinding. Referring to damp situations, he said that in a Scotch milling house the atmosphere contained a large amount of moisture and of nitrous oxide, which would be destructive of anything that could be used to make a motor. In these circumstances, and as they did not wish to supply special motors for special jobs, they preferred to install an ordinary motor outside the house rather than to supply a totally-enclosed motor and run the risk of its getting corroded. They did not use a stove, but heat was obtained from steam supplied by the boiler house. He agreed as to the danger of under-cutting the mica to too great an extent. If a motor had been running very well, they would not cut the mica at all, but he had frequently found in the case of a motor described by the customer as a bad motor, that there was nothing really amiss beyond the mica being a bit high, and when this had been skimmed on the motor ran excellently. His remarks about ball bearings had been somewhat misunderstood. He did not mean to suggest that there was anything

wrong with ball bearings; his objection to them was purely a local one, due to the time required for effecting a repair. For instance, it would probably take about three hours to take the armature of a 50-h.p. motor out, as they would have to take the end shields off, which would be a lengthy matter. He had some motors in use with ball bearings, and the proportion of troubles had been quite as great as with the other type. About four years ago he set to work to have all the motors inspected, as he thought this was the proper thing to do. His experience, however, proved most unfortunate, as he often found that probably a fortnight after the man had called a motor broke down, although the machine appeared to have been running satisfactorily when inspected. They were now getting the customers to let them know when they thought anything was amiss, as it was more likely that the customers would notice anything going wrong than a man who called and only saw the machine running for a short time. In Leeds, where there were about five times as many motors installed, he believed they had men going round who did nothing else but inspect motors. If they had this system in Hawick, the cost would probably be about double what it was; in other words, it would cost as much, or more, to inspect the motors as to repair them. With regard to the framework of starters frequently being too light, he had experienced this trouble himself, and he believed it was now quite a standard practice in most towns, where this business was carried on, to have iron fixing boards drilled with standard holes. This was an ideal arrangement, but he did not think it could be adopted in small towns like Hawick until there was some form of recognised standard starter; at present there were all sorts and sizes of starters.

HIGH-TEMPERATURE WORK.

THE March meeting of the FARADAY SOCIETY was devoted to what was called an informal discussion on "Methods and Appliances for the Attainment of High Temperatures in the Laboratory." Sir ROBERT HADFIELD, F.R.S., President, was in the chair, and the discussion was opened by Dr. J. A. HARKER, F.R.S., whose important work at the National Physical Laboratory entitles him to speak on this subject with exceptional authority. A large audience, which included some of the best-known workers in this field, kept up an eminently practical discussion till long after the normal time for concluding meetings.

The President's short introductory address told of the difficulties he and other experimenters had to contend with in times gone by in trying to melt small quantities of metals like steel or copper in the laboratory. That was before the advent of the electric furnace, which had wrought so great a revolution in high-temperature work; but progress in pyrometry was a factor of no less importance, and he gave in this connection a short historical sketch, beginning with Wedgwood's work in 1782, and coming down through Le Chatelier, Osmond, William Siemens, Roberts-Austen and Callendar to the recent work carried out by some who were going to take part in the discussion that night.

Dr. HARKER dealt almost exclusively with carbon resistance furnaces, first made by Living and Dewar. A simple method of making a furnace was to bore out an arc carbon, but the hardness of the carbon made this difficult. Fortunately, the General Electric Co. now had a stock of thin-walled carbon tubes in many sizes for this purpose. The advantage of carbon was its high specific resistance. Graphite was much easier to handle and bore—it turned as easily as a hard wood—but its low resistance, one-fifth that of carbon, was a drawback, and it necessitated turning the tube into a spiral. One had only to wrap copper conductors round the ends of the tube and the furnace was essentially complete.

Dr. ROSINMAN, later on, suggested coating the carbon tube with copper, aluminium, or iron, by the Schöpp spray process, finishing the coating to give good metallic contact. It was attention to small details, such as the resistance of the end contacts, which made all the difference between a good and a bad furnace. Great heat heating at the contacts was fatal to success, and water cooling was now usually adopted. The furnace had, of course, to be enclosed, both for heat-insulation and to prevent the escape of carbon monoxide fumes. The most recent type of furnace, built by Mr. Eden at the National Physical Laboratory (shown in operation at the meeting), used ferroconcrete for this purpose, in preference to firebricks.

Dr. GREENWOOD, however, stated his preference for firebrick for many purposes, on account of the ease with which a brick furnace of any size or shape could be put together, and for lagging he preferred charcoal. Dr. HARKER, on the other hand, recommended that fine grade of soot known as painter's lampblack. Filling up with this material the space all round the carbon tube for a radial distance of three inches gave most effective insulation at high temperatures. The one kilowatt which maintained the furnace exhibited at 2,000 deg. C. only heated the outside wall of the furnace to something over 100 deg. This temperature of 2,000 deg., by the way, was attainable in two or three minutes. To prevent the soot from falling through the spiral groove in the carbon or graphite tube, it was only necessary to wrap filter paper

round the tube. Its ash sufficed to keep the light soot from falling.

An important point in connection with these furnaces was their economical running. It was necessary to obtain high temperatures with little power consumption. For this purpose Dr. Harker used a small, home-made portable transformer, on which were 80 turns of primary, split so as to be used at 300 volts and downwards, and 3 secondary turns capable of being coupled in series or parallel. Currents up to 1,000 amperes could be obtained. One of the furnaces exhibited was to be sent to Hadfield's Steel Works, at Sheffield, for standardising optical pyrometers, which appear to be largely in use, for these particular furnaces were used for a like purpose at the National Physical Laboratory.

Mr. R. S. WHIFFLE said that furnaces like Dr. Harker's, but larger, had been installed by Northrup, in America, for gear-hardening. Thermo-couples passed through the furnace on to the work, which was simply brought above the recalcenscent point as indicated on a recording pyrometer, and then taken out and quenched—a beautiful industrial application of scientific phenomena.

Useful as is the carbon tube furnace, the presence of carbon and carbon compounds is often a drawback where perfectly pure metals or alloys have to be melted, and the discussion turned largely on substitutes for carbon. On a small scale, Dr. Rosenhain and others have found a tungsten wire vacuum furnace effective, and pure iron (M.P. 1,525 deg. C.) can be melted in such a furnace. But the tungsten becomes brittle on cooling from a high temperature, and a fresh winding is necessary for every run. Up to 1,000 deg. C. Mr. C. R. Darling and Mr. H. G. Lacell were able to recommend a kieselguhr tube wound with nickel-chrome wire. A furnace 1 ft. long, using an inch tube, consumes only $\frac{1}{2}$ k.w., and it can be rigged up in a few minutes. The arrangement should prove useful in innumerable directions. For very high temperature work, such as melting platinum or iridium (over 2,000 deg. C.), gas or oxy-hydrogen had still to be used, but experiments in the use of pure zirconia tubes for resistance furnaces are being carried out at the National Physical Laboratory, and if these should prove satisfactory this aspect of the high-temperature problem will be solved.

Mr. H. A. KENT drew attention to the possibilities of surface combustion; if one could use pure zirconia in granular form almost any temperature could be so attained. Nevertheless, the possibilities of gas furnaces have not by any means as yet been exhausted, although the present uncertain quality of coal gas is at the moment a difficulty. Much was said in the course of the discussion about the modern high-pressure types, in which not only the pressure, but the violence and turbulence of the explosive mixture as it enters the jet, is a necessary condition—as it is in a gas engine cylinder—of high-temperature combustion. One type described by Dr. Rosenhain in use at the National Physical Laboratory has a special form of injector burner for use with compressed air at 100 lb. per sq. in., and with these temperatures up to 1,800 deg. C. are obtained. An excellent burner is that bearing the name of Mr. Brayshaw, and it was described by the inventor. The essence of this burner is the wings, or side-pockets, round which the mixture of gas and air under pressure circulates becoming violently agitated on the way to the jet.

Mr. A. J. WEBB said he had accidentally melted a large piece of platinum in this burner with an air pressure of only 20 lb., while small quantities could be melted with 3 lb. air pressure.

Sir ROBERT HADFIELD said that Bessemer had worked with very high pressure blasts at one time, and he was glad the idea was being taken up again; he believed they would have a great future.

DIESEL ENGINE USERS' ASSOCIATION.

At the March meeting of the Association the subject of "Tar Oils as Fuel" was further discussed, and the President, Mr. GEOFFREY PORTER, gave some particulars concerning the unfavourable results which had been obtained in mixing tar or tar oils with ordinary crude oil for use in Diesel engines.

Mr. W. FENNEL introduced the subject of the use of paraffin oil as fuel. In the discussion which ensued, the opinion was expressed that paraffin could be quite suitably used as fuel at times when its price showed any advantage as compared with the price of other fuels. It was necessary to run at a lower blast pressure when using paraffin.

The Honorary Secretary read a report which had been made to Lloyds' Underwriters by Mr. P. H. Smith on the accident which occurred in the Smithfield Markets Electric Supply Co.'s power station on February 6th.

According to the report, the compressor attached to the engine is of Messrs. Reavell & Co.'s standard quadruplex type, comprising four cylinders, viz., two low-pressure cylinders, one intermediate, and one high-pressure. The air is drawn into the low-pressure cylinders through slots in the piston pin, and is then compressed, passing into the L.P. receiver or purge pot, through copper pipes immersed in the water jacket of the compressor. This purge pot contains a drain and regulating valve, and a relief valve set at about 100 lb. per sq. in. The air from the L.P. purge pot is drawn into the I.P. cylinder past a valve through another cooling coil. Then it is com-

pressed and delivered past another valve into the I.P. purge pot, which is almost identical with the L.P. pot, except that its relief valve is set to blow freely at 300 to 400 lb. pressure. From the I.P. pot it passes into the H.P. stage, from which it is delivered to the small bottle, being cooled immediately after passing the H.P. delivery valve.

The compressor is so designed that, under normal conditions, and when pumping its full capacity, the absolute terminal pressures of the various stages are approximately:—L.P., 60 lb.; I.P., 240 lb.; H.P., blast pressure.

A feature of the design to which particular attention is called is the construction and location of the I.P. plunger. This being, so to speak, inverted, receives an excess of lubricating oil, which when the engine is standing collects in the inverted piston and can, in actual practice, get past the rings into the cylinder itself. The rings are forced tight against the cylinder walls not merely by their own spring, but by air pressure passing behind the rings, the air being conducted thereto by four small holes communicating from the inside of the cylinder to the ring grooves.

It appears that this construction greatly facilitates the ingress of the oil to the I.P. cylinder when the engine is allowed to stand, and as seeming to corroborate that the oil actually takes this path, it is worthy of note that in most cases these holes soon choke up. In the case of the compressor under examination; two out of the four holes were choked. Further evidence of the ingress of the oil in this manner is supplied by the extraordinary condition of the H.P. valves, which were both very heavily carbonised in 30 hours' running.

Assuming that both H.P. valves are inoperative, the L.P. terminal pressure may reach a maximum of 60 lb. absolute and the I.P. terminal pressure is that of the blast. But the L.P. terminal pressure is approximately the I.P. suction pressure. If the compressor is running slowly with the L.P. drain valve fully open, the pressure in the L.P. purge pot will not greatly exceed atmospheric pressure. Hence, on the assumption that the H.P. valves are both inoperative, the pressure in the I.P. cylinder would be raised from slightly above atmospheric pressure to the blast pressure in a single stage.

These conditions apparently prevailed to an indefinite degree at the time of the accident, for, at the inquest, driver Baker remarked that he had started the engine in the usual way, the drain valves on the compressor being open. Then, when the engine commenced to fire, he closed them and immediately turned to the blast bottle. He had just commenced to throttle the blast to recharge the bottles when the explosion occurred. His estimate of the number of revolutions of the engine to the time of the explosion is only 20.

What happened was that the I.P. purge pot burst. The pot was of good average quality iron, and was of even thickness. Assuming its tensile strength at 7 tons per sq. in., its bursting pressure would be about 2,400 lb. per sq. in. Hence, no pressures ordinarily prevailing in the compressor would be likely to cause its fracture.

Mr. Smith therefore submits that the pressure originated from a spontaneous ignition of oil vapour in the I.P. purge pot, the temperature necessary to produce the ignition arising from the compression of the air in the I.P. stage. Provided that the oil is very finely divided, it may combine with oxygen with sufficient rapidity to cause it to ignite, notwithstanding that the surrounding temperature is well below the ignition point of oil vapour.

Assuming that the flash point of the oil were as high as 450 deg. F., the inlet temperature to the I.P. is only 80 deg. F., and that the compression follows the law $p v^{1.25} = \text{const.}$, then the I.P. stage has to compress the air to $1/14$ th of its original volume to attain 450 deg. F. as the terminal temperature. Working at full capacity, this is the equivalent of raising the pressure in the I.P. stage from, roughly, 60 lb. absolute to 800 lb. This of itself is quite feasible provided that the I.P. relief valve was inoperative.

The evidence is that the I.P. relief valve did not blow, so that it is very probable that the terminal I.P. pressure was well below 800 lb., as, on testing the I.P. valve, it commenced to lift at 350 lb. Probably the valve would not have lifted under 400 lb. pressure at the time of the accident, but assuming now that the terminal I.P. pressure was 450 lb. when the explosion occurred, or well below the pressure at which the valve was nominally set, the initial pressure would have been 10 lb. gauge pressure to result in the attainment of 450 deg. F. terminal temperature under the assumptions specified above.

From a study of different drivers, Mr. Smith is strongly of opinion that in the time elapsing between Baker's closing the L.P. drain valve and turning to the bottles, the L.P. pressure had not attained even this figure. Hence, on this hypothesis, he finds a very possible explanation of spontaneous ignition arising.

The fractured purge pot showed a black deposit on an otherwise clean fracture in the pipes communicating with the pot, and also inside the pot. The inside of the Chelsea purge pot recently examined did not dirty the fingers at all. Hence, he concludes that an ignition explosion occurred, and makes the following recommendations accordingly:—

1. Fit pressure gauges on both L.P. and I.P. purge pots.
2. The holes leading behind the I.P. rings to be plugged. This will probably prevent the oil gaining easy ingress to the I.P. cylinder and so reduce the heavy carbonisation of the H.P. valves.
3. Fit a large relief valve to the I.P. and L.P. pots.

4. Relief valves should be tested periodically for lifting pressure.

5. There may be some advantage in fitting a non-return valve between the H.P. delivery and the bottle. This valve should be fitted as close to the H.P. outlet as is convenient.

6. Drivers in charge should make a habit of feeling the temperature of the purge pots. The H.P. is always the hotter when the machine is in good order, but when the H.P. valves become defective the I.P. becomes warmer.

7. To safeguard the water jacket, it is advised to work with an open top to the compressor, or where this is difficult to fit, then in place of the diaphragm or relief valve usually fitted, it is advised to place a stand pipe 4 in. to 6 in. diameter of sufficient height to obviate "head" difficulties.

The next meeting of the Association was to be held on Wednesday, April 12th. Information concerning the Association can be obtained from the Hon. Secretary, Mr. Percy Still, 19, Cadogan Gardens, London, S.W.

REVIEWS.

Single-phase Railways. By EDWIN AUSTIN. London: Constable & Co., Ltd. Price 21s. net.

This book consists of descriptions of complete railways or portions thereof which have previously appeared in the columns of *The Engineer*, considerably added to for publication in volume form. The author explains in his preface that, after delaying publication in order to make it cover everything, it became necessary to go to press without reference to the latest "split phase" developments. It can, therefore, be taken as being as nearly up-to-date as is practicable for a book describing the applications of a rapidly advancing art.

On the other hand, it is essentially descriptive and not theoretical. Although a good deal of information can be extracted on such matters as the characteristics of various motors, control systems, &c., involving more or less theoretical explanation, it is necessarily not in the consecutive form expected in a theoretical work.

The first chapter gives a *résumé* of the case for single-phase equipment of railways, pointing out particularly that the system lends itself to unlimited extension, whilst the low-tension direct-current system does not, and that though the direct-current system may be more suitable for suburban services, the inconvenience of working two systems is in favour of the one which can be extended. On the matter of overhead *versus* third rail equipment, it is remarked that the cost of the former has been considerably over-estimated by some advocates of the latter, that overhead equipment has been built at so low a cost as £800 per mile, that the high-tension direct-current system has to use overhead equipment, that the true criterion is relative total operating costs, and that every case should be decided on its merits. This is the true gospel, but its application is at present somewhat difficult owing to the paucity of data which can be fairly compared. It is quite on the cards that the controversy may be settled by developments permitting a combination of alternating-current transmission and distribution with continuous-current motor equipments, a combination of the strong points of both systems.

Very complete descriptions are given of the two English examples, the London, Brighton & South Coast suburban lines and Midland Heysham, Morecambe and Lancaster lines, with both of which our interested readers will be familiar. The illustrations of the Brighton work are particularly full, and include the profiles of the lines and a complete diagram of the distribution system, including the boosters used to keep the drop in the rails within the 20 volts allowed by the Board of Trade. Tests show that with the boosters used of operation 84 per cent. of the current returns by the rails and uninsulated outers of the feeders, but with the boosters in circuit nearly the whole current returns by the insulated return feeders.

The description of the Midland Railway work is less detailed, but the light, economical character of the overhead work is well brought out, as well as the ingenious trolley insulating devices.

A whole chapter is devoted to the electrified lines of the Midi Railway in France, notable as obtaining their power supply from Pyrenean waterfalls. Here, again, the overhead work is of a simple character, but of varying design on different sections, as at least four different contractors have had a share in the work and have each introduced their own material. It seems to have been the policy of the Midi Co. to divide the early work between different firms, as they have done the same thing in respect to locomotives, no doubt with the object of finding out by experience the most suitable equipment in each branch for guidance in future developments. There is, therefore, the interesting feature of illustrated descriptions of locomotives built by the French Thomson-Houston, Westinghouse, Construcciones Electricas du Nord et de l'Est, Brown-Boveri, and A.E.G. Companies, all to the railway company's performance specification, and all differing in the ways the requirements are met. Regenerative braking was one of the requirements, important because the lines have considerable gradients, and the description in-

cludes a discussion of regenerative braking of an illuminating character. It suggests that this action is easier of attainment with single-phase than with continuous-current equipment. It may be said generally that with continuous current "it is not done," despite persistent and gallant attempts extending over nearly the whole history period of electric traction. There have, however, been recent important developments on American direct-current railways. The trolley wire on these lines is supplied at 12,000 volts 16½ cycles.

Chapter IV is occupied with descriptions of four German lines: The Blankenese-Hamburg-Ohlendorf, Dessau-Bitterfeld, Murnau-Oberammergau, and the Mitterwald Railways. The second-named of these lines is remarkable for the size and power of the locomotives employed, and also for the elaborate design of the overhead contact system. The overhead supporting structures on the Blankenese line show much variety of contrivance to suit varying and difficult conditions. Both lines belong to the Prussian State Railways. The Murnau-Oberammergau line is notable for a gradient between three and four miles in length, with a general rise of nearly 3 per cent. The overhead work is of a much simpler character than on the State Railways before-mentioned.

The Mitterwald line is not exclusively German, as it extends into the Austrian Tyrol to Innsbruck. It is a characteristic mountain railway, with numerous tunnels, viaducts, and bridges, and some severe gradients. It was built for electrical working, and it is reckoned that about 2½ miles length was saved in the most difficult section by the use of steeper gradients than are permissible for steam traction. This saving in construction amounts to more than the total cost of the electrical equipment; an example worthy of note for future mountain railway propositions.

Chapter V is entirely occupied with a description of another mountain line, the St. Polten-Mariazell Railway, entirely in Austria, and also possessing a large number of tunnels, viaducts, and bridges. The gauge is only 0.76 m., say 2 ft. 6 in. It was built for steam working, but the capacity of the line so worked soon proved to be unequal to the traffic demands upon it.

Chapter VI describes four Swiss lines, of which the last, the Lötschberg-Simplon, is by far the most important in many respects. There are, however, some points worth notice in the equipment of the smaller concerns. The Martigny-Orsières line employs Déri repulsion motors, in which the reversal and torque and speed regulation are obtained by shifting a pair of auxiliary brushes, each connected to one of the fixed brushes. The electrical functions of the controller are limited to switching on and off the motor stator current. Everything else is done by the mechanical shifting of the brushes. The simplicity of this control gear is in striking contrast with the complexity of most of the alternative arrangements for series and composite series-repulsion motors, and as it is definitely stated that the starting torque, efficiency, and power factor of the motors compare favourably with those of series motors, the question arises, but is not answered in the book under notice, why has not the Déri system superseded all other single-phase traction motors. The claims are perhaps overstated.

The Lötschberg-Simplon Railway forms part of the international route from France through Berne and the Simplon Tunnel to Milan; it, therefore, has to carry trains of the heaviest character. The physical characteristics of the line are severe, including steep gradients, sharp and almost continuous curves, and long tunnels. The summit tunnel—Lötschberg—is 14½ kilometres (say, 8½ miles) in length, and on the northern approach there is a remarkable double loop shaped like an attenuated figure 8, of which much is in tunnel and little straight. The conditions are, therefore, exacting. For the purpose of local traffic, motor-cars were first adopted, though traffic locomotives of 2,000 H.P. were first adopted, followed later by locomotives of 2,500 H.P. The former were driven by two motors, each carried on a six-wheeled bogie with coupled axles. The first reduction gear consists of a three-row Citroen pinion and gear wheel. This gearing permits the use of high speed and lighter motors for the power than direct coupling.

The new locomotives of 2,500 H.P. exhibit considerable departures in design from the earlier ones. They also have two motors, but these are placed in the centre of the locomotive body, and drive the five coupled axles through two jack-shafts. The total weight is 107 tons, the weight on the driving-wheels 78.2 tons, the tractive force at the wheel rims 13½ tons at a speed of 50 km. (say, 31 miles) per hour. The maximum speed is 75 km. (say, 47 miles) per hour, and they can haul a train weighing 310 tons up a grade of 2.7 per cent. These locomotives, therefore, compare with all but the heaviest of European steam locomotives, and are probably the most powerful electric locomotives yet put into European service. The control arrangement presents some interesting features. The controllers are fixed immediately above the transformers with the secondary tapplings connected directly to the contact fingers. The controller drums are driven by a pawl and ratchet gear actuated by a motor. The direction of rotation is controlled by a pair of electromagnets which lift one or other pawl out of gear. By actuating these magnets, therefore, the driver permits the continuously-running motor to turn the controller drum in either direction, or to leave it stationary. For dealing with very large currents, in this instance up to 3,000 amperes, at 400 volts, it is claimed that this direct action is more satisfactory and simpler than con-

tactor control. There are, of course, blow-out devices, and the usual series-parallel connections are available, both for the transformers and the motors. The supply on this line is at 15,000 volts, 25 cycles. The reader will not find any information about the difficulties with insulation which are said to have been experienced in the tunnels of this line. The overhead work is on the Siemens-Schuckert system.

Descriptions of the Rotterdam-Scheveningen Railway, a Siemens-Schuckert line (where the original three-phase scheme was altered to single-phase after the generating plant was far advanced, necessitating some ingenious adaptations resulting in the eventual supply of two phases to different line sections), and of two Norwegian lines occupy Chapters VII and VIII. The most interesting point in the latter is the description of telephone disturbances on neighbouring lines due to a large high-frequency harmonic in the generator voltage wave. This trouble was substantially overcome by connecting a tuned resonance shunt across the terminals, forming a virtual short circuit for the high-frequency current. This current proved to be of small magnitude, and, therefore, insignificant as a loss.

The Swedish State Railways have determined to adopt 15-cycle, single-phase energy as the general electrification standard. The conditions in Sweden are dear coal, abundant water power, and, in general, sparse population and low traffic density. These are evidently conditions in which economical transmission of energy is a ruling consideration. The first line electrified, described in Chapter IX, is that between Kiruna and Riksgränsen, only about eight miles in length, but wholly within the Arctic Circle, and the most northerly line in the world. It is mainly used for iron ore carrying, and, as in other mountainous mining districts, electrification has greatly increased the carrying capacity. The limits of steam traction had been reached. The practical and financial results are shown to be quite satisfactory.

The Fanna single-phase line described in Chapter X is of somewhat special interest, because a portion of it is really a town tramway, and the remainder a roadside light railway. The tramway portion is worked at 400 volts and the railway part at 4,000 volts. The facility afforded by the single-phase system of working at the two voltages seems to have largely determined the choice, but the lines extend in two directions to about 15 miles from the power house, so that transmission and distribution economies were not negligible.
